Wheat, Spring, $1.30@1.46; Spring No. 2, $1.43@1.45; red Winter No. 2, $1.52½@1.53½; red Winter, $1.40@1.54; white Western and State, $1.40@1.52. Rye, $1.05@1.09; Oats, white No. 1, 57@57½c.; No. 2, 55@56c.; No. 3, 52@53c.; mixed, No. 1, 48½@49c.; No. 2, 47½@48c.; No. 3, 44@46c. Corn, Western mixed, 68@71c.; No. 2, 73@73½c.; yellow, 73@77c.; white, 78@80c. Barley, Canada, No. 1, $1.10@1.13; do. bright, $1.14@1.16.

Receipts for the week, wheat, 1,000,782 bush.; corn, 1,709,925 do.; oats, 216,319 do.; rye, 29,511 do.; malt, 72,814 do.; barley, 185,450 do.

Exports for the week, wheat, 725,228 bush.; corn, 397,480 do.; oats, 73,252 do.

The visible supply of grain, comprising the stocks in granary at the principal points of accumulation at lake and Atlantic ports, and on rail, on lakes, on canal and on Mississippi River:

	1881. Sept. 17. bush.	1880. Sept. 10. bush.	1879. Sept. 18. bush.
Wheat	19,491,352	14,360,769	18,146,639
Corn	27,581,974	19,812,209	10,938,531
Oats	6,468,050	2,746,353	2,511,868
Barley	1,393,024	1,403,506	1,705,277
Rye	901,804	664,846	687,008
Total	55,639,291	38,987,683	34,019,323

HAY AND STRAW.—Exports for the week, 275 bales. Only the best grades of hay show firmness; prices for under grades have a wider range, average quality being quite poor again. Straw steady.

Prime Timothy hay, ₱ 100 lbs., $1.05@1.10; medium Timothy, 80@95c.; shipping grades, 60@65c.; clover mixed, 70@75c.; clover, 60@70c.; Straw, long rye, 70@75c.; short rye, 45@55c. oat and wheat straw, 30@40c.

HONEY—Offering at 17½@18c. white clover comb choice; 14@16c. fair to good; 13@14c. buckwheat. These are mostly retail or single-case prices; a fine line of clover is reported at 16c.

HOPS.—The market has advanced for all good hops under news of possible wants abroad, especially for England. The new prices have not been paid largely by any interest as yet; brewers will not pay the extreme for any grade.

Crop of 1881, choice, 26@28c.; good to prime, 22@24c.; fair to good 20@22c.; 1880, choice, 20@22c.; fair to prime, 14@18c.; poor to fair, 10@14c.; eastern, 10@15c.; 1879 fair to prime, 12@14c.

Receipts for week, 3,931 bales.

Exports for the week, 1,325 do.

MILK.—The supply has been very short and in some instances retailers had to pay wholesale all they could charge their customers. The average for commission milk, 40-qt. cans was $3.36, opening at $3 and closing at 4. The price paid farmers for Sept. was 2@2½c. Consumers begin to express very widespread dissatisfaction at the practice of feeding beer-grains to cows, and it will not be long before the abuse will be resented.

POULTRY AND GAME.—The market is steady for nearly all kinds of dressed poultry, the cooler weather causing a better demand. Quotations for turkeys are for mixed young and old; the demand for them is good. Chickens and fowls sell promptly. Spring ducks in good demand, old neglected. A few Philadelphia young geese sold at 11c. Western old geese sold at 10@12c. Squabs are selling less freely because of the larger supply of game birds and are quoted lower.

Turkeys, Phila. prime, 15@16c.; State and Western dry-picked, 14@15c.; scalded, 13@15c. Chickens, Phila. spring, 19@20c.; Bucks Co. do. 17@18c.; Jersey, do. 16@17c.; State, do. 15@16c.; Western, do. 14@15c. Fowls, Phila. dry-picked, 16@17c.; Bucks Co. 15@16c.; Jersey, dry-picked, prime, 15@16c.; do. scalded, 14@15c.; State and Western, dry-picked, prime, 15@16c; scalded, prime, 14@15c.; inferior, 12@13c. Ducks, Spring, Phila. ₱ lb, 17@18c.; Jersey and Bucks Co. 16@17c.; State, 15@16c.; old, fair to good, 10@12c. Squabs, white, ₱ doz. $2.50@2.75; dark, $1.50@1.75.

Chickens and fowls have brought good prices, but have fluctuated a little according to supply. At the close there is as much stock offerings as can readily sold at quotations. Turkeys have sold well, generally mixed old and young at 12@13c. A few extra old turkeys reached 15c. Extra large ducks are scarce and higher, but medium and poor are in fair supply and only steady. Geese quiet and unchanged.

Chickens, Jersey, spring ₱ lb. 15c.; State and Penn. 11@14c.; Western, 11@13c.; Southern, 11@13c.; Fowls, Jersey, State & Penn. 14c.; Western, 13c.; Southern, 13c. Roosters, old, 7@8c. Turkeys, Jersey and Penn. 13@14½c.; Western, 13@14c.; young, 10@13c. Ducks, Jersey, extra-large, ₱ pair, $1@1.25; Jersey, New York and Penn. 60@75c.; Western, 50@60c.; Southern, 50@55c. Geese, Jersey, per pair $1.50@1.75; N. Y. and Penn. $1.25@1.50; Western mixed 87c.@$1.12; Southern, 75c@$1. Pigeons, large, strong birds, 25@30c.; young, 20@25c.

Game has an inferior demand with more favorable weather for use and show.

Grouse, choice, $1.12@; soft, 50@75c.; partridges, prime, $1.25@1.50; soft, 75c.; woodcock, choice $1.25; inferior 75@85c.; English snipe and plover, fresh-killed, $1.75@2.00; venison, Minn. short saddles, 19@20c.; Western, 16@18c.

Grass plover very scarce and quoted at $3 ₱ doz. Reed birds firm at $1@1.25 and black birds dull at 25@30c. per doz. Wild ducks scarce and salable at 75c. for mallard and red-head, 40@50c. for teal and wood, and 30@40c. for common ₱ pair.

PROVISIONS.—Hog products have lost their buoyancy; quotations have been moving in buyers' favor all the week and a sharp decline is noted at the close. Hogs have arrived in larger quantities than was expected and that fact together with tight money have given a pause to speculative and prompt buying interest. Beef and beef hams steady.

Pork, extra prime, ₱ bbl. $15@15.50; Western mess new, $19.50@20. Lard, steam Western, ₱ 100 lbs., $12.2 prime city, $12.15. Hams, smoked city, ₱ lb. 13¼@13¾c.; pickled Western and city, 12¾@13¼c.; Shoulders, smoked city, 9@9¼c.; pickled, 8¼@8¾c. Rib bellies, pickled, 10¾@11c. Bacon, long clear and Western, 10⅜@10¾c. Beef, Western mess, ₱ bbl. $12@13; packet, $13@14; India mess, ₱ tce. $21.50@23.00. Beef hams, ₱ bbl., $22@23.

Receipts for the week—Beef, bbls. and tcs. 382; pork, bbls 3,420; cut-meats, pkgs 12,111; lard, do. 11,596.

Exports for the week—Beef, bbls. and tcs. 916; pork bbls. 2,550; cut-meats, lbs. 5,613,940; lard do. 4,477,780.

SALT.—The advance that has been quoted is well held, the importations running moderate and demand good. The following are the quotations:—Ashton's at $2.50; Higgins's at $2.50; Phœnix superfine sifted dairy at $2.50; Holmes's extra sifted, $2.40; Deakin's at $1.40@1.50; Evans's at $1.40@1.50; Washington's at $1.40@1.50; Marshall's at $1.40@1.50 Virden's at $1.40@1.50; Worthington's at $1.40@1.50; Turk's Island, 25@30c.; Mediterranean at 25@28c.

SEEDS.—Clover dull; no export inquiry; sales could not be made above quotation, but holders generally refuse to accept the prices. Timothy in good consumptive demand and firmer.

Clover, Western, 1881, car lots on track, 9¼@9¾c.; Timothy, job lots in store, $3@3.25; flax-seed, American rough, ₱ bush. $1.42½@1.45.

Receipts for the week, 5,520 bush.

TOBACCO.—There has been something of a frost-scare to invigorate sales, but no positive advance has resulted.

VEGETABLES.—Exports of potatoes for week, 4,471 bbls. Choice potatoes are not plenty and shippers, grades are not equal to export orders. State potatoes when sold in bulk, and nearly all arrive so, are quoted 175 lbs. to bbl. Sweet potatoes firm again.

Potatoes—Early Rose, Eastern, ₱ bbl., $2.75@3; L. I. bulk, $3@3.25; State, $2.50@2.75; Prolific, Eastern, $2.62@2.75; Snowflake, State, $2.50@2.75; Burbank, State, $2.50@2.75; do. L. I. $2.87@3; Peerless, State, $2.25@2.50; sweet potatoes, Va. yellow, $3@3.25; Del. River, $3.25@3.50; Jersey, $2.75@3.

The frost of the past week has stiffened prices for most garden truck.

Sweet corn, ₱ 100, 75c.@$1; wax beans, L. I., ₱ bag, $1.75@2; string beans, $1.75@2; cucumbers, ₱ 100, $1.25@1.50; pickles, ₱ 1,000, $1.50@3; egg plant, ₱ 100, $5@6; tomatoes, ₱ bush., 40@50c.; squash, Marrow, ₱ bbl., $1.50@1.75; cabbage, ₱ 100, $7@10; beets, L. I., ₱ bbl., $1.50@2; white onions, bulk, $2.50@3; yellow, $2.25@2.50; red, $2@2.25; red Chester, $2@2.25; carrots, ₱ bbl. $1.50; turnips, Russia, $2.25@2.50; cauliflower, $1@5.

WOOL.—The offerings have been very readily bought up, and prices, without being actually higher, have hardened to an extent that precludes some moderate concessions that might have been obtained a week or so ago. Never in the history of the trade has the clip been so well marketed at this early date as for this season, and the wool-grower seems determined to occupy his full place in the increasing commerce of the country.

LIVE STOCK MARKETS.

NEW YORK, Saturday, Oct. 8, 1881.

BEEVES.—Receipts for the week, 13,309 head; do. last week, 13,571 do. Thirty-four car-loads of Colorados sold on Friday at 7¾@8¾c. to dress 55 lbs.; 2 cars of Montana cattle at 5c. live weight, and the range for common to strictly choice native steers was from 8c. to dress 55 lbs to 12¾c. to dress 57 lbs, and 5½c. ₱ head—latter price for a car-load of Kentucky steers, 1,467 lbs average. No very poor cattle on sale. A car of small grass-fed bulls changed hands at 2¾c. live weight.

COWS AND CALVES.—There has been a brisk demand for good cows; buyers have paid $55 by the car-load and in a smaller way $60@70 have been frequently quoted.

VEAL CALVES—There is a good demand for prime calves. Many lots run poor and show forced marketing.

Live calves, prime N. J., 9@9½c.; do. State, 8¾@9c.; poor to good, 6@8¾c.; Mount Hollys, 7@9¼c.; buttermilks, 4@5c.; grassers, 3¾@4c.

SHEEP AND LAMBS.—Receipts for the week, 45,478 head; do. last week, 30,574 do. Prime stock was in demand at fair prices, but common and medium grades of both sheep and lambs, which have composed the greater part of the offerings, have had slow hold. The reported transactions were 3½@5¼c. for poor to good sheep and 5½@7¼c. for common to prime lambs. Twenty car loads of stock are reported to arrive at 60th st. to-morrow, but probably several loads of lambs will be taken off at Albany.

SWINE.—Receipts for the week, 27,471 head; do. last week, 27,043 do. Live Western corn steady at $6.70@6.90 ₱ 100 lbs. New Jersey pork, 8@9¾c.; city dressed, 9c.

Terms for 1881.

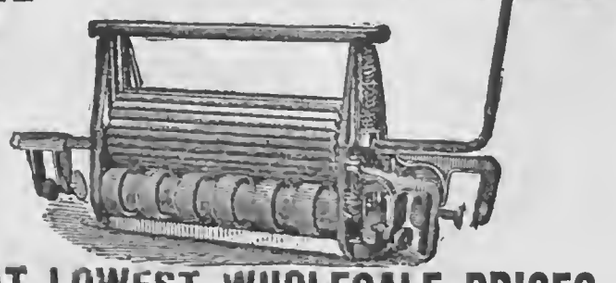
THE KEYSTONE WASHER.

OVER 300,000 IN ACTUAL USE.

And all giving perfect satisfaction.

AGENTS WANTED.



Will wash Cleaner, Easier, and with Less Injury to Clothes than any other in the World. We challenge any manufacturer to produce a better Washer. Every Machine Warranted FIVE Years and Satisfaction Guaranteed. The only Washer that can be clamped to any sized tub like a Wringer. It is made of malleable iron, galvanized, and will outlast any two wooden machines sold. Agents wanted. Exclusive Territory. Our agents all over the country are making from $75 to $200 per month. Retail price, $7. Sample to agents, $5. Also our celebrated

KEYSTONE WRINGERS AT LOWEST WHOLESALE PRICES.

Circulars Free. Refer to editor of this paper. Address F. F. ADAMS & CO., Erie, Pa.

EXPLANATION.

THE reports of fairs will, for a few weeks, necessarily interfere with the literary departments of the paper. We ask indulgence for the limited allowance of space.

WITH MUCH SYMPATHY for the bereaved, we make the following announcement: On September 13 occurred the death of Alice Carey, age three years, daughter of Dr. and Mrs. T. H. Hoskins, of Newport, Vt.

For the Young.

NOTES.

WE ARE contemplating for the next Children's Seed Distribution the sending out of a package of seed (varieties yet to be selected) to each member of the club, and for the best yield from the seed sent a prize will be offered. As there are probably some members of the club whose names are yet on our list who have changed their residence, or who may no longer be interested in us, I propose to revise the list, or rather begin a new one. Now, note carefully what I say! Every boy or girl who wishes to become a member of the RURAL Horticultural Club and share in its Seed Distributions when made, and who will agree to write to Uncle Mark at least twice a year, and as much oftener as they desire, may now send in their names and addresses, which will be at once enrolled. This must be done immediately in order to secure a share in the Seed Prize. Those who were previously members of the Club must send in their names as well as those who were not; and this revised list will be published in 1882, and thereafter annually.

IT IS thought best to hold our "Club Discussions" but once a month, so that the next one, on Orchard Fruits, will be published in the RURAL for Nov. 5. However, let all respond early. The more the merrier!

WE HAVE been obliged to sacrifice much of our department to pressing matter this week. Sorry! U. M.

Entomological.

LIME TREE WINTER MOTH.

(See page 701 for illustration.)

IT is often said that if any wild plant be taken and by patient cultivation made to beautify the home of man or contribute to his wants, it is attacked by a host of insects and other foes that had never before preyed upon it. While investigation does not prove the saying to be strictly true, still a survey of the different insects that feed upon any one of our cultivated plants, would seem to show that it is so. Take, for instance, the apple tree. In the seventh Illinois State Entomologist's Report no less than 23 different species of caterpillars, or larvæ of butterflies and moths, are enumerated as feeding upon this tree, either on the leaves or the fruit, to say nothing of the numerous beetles that bore its trunk or fruit, or the other orders of insects that live on some parts of the tree. The insect named at the head of this article, the Lime Tree Winter Moth (Hybernia Tiliaria) is not one of the 23, but one more that may be added to that list.

The Lime Tree Winter Moth is related to the canker worms, in that its habits are not unlike those of the Fall canker worm that is the most common in the northern portion of the United States. Its most common food plant is the lime tree or basswood, where some of them may be found every year, but occasionally they are found on elm or apple trees where they do considerable damage. Like the canker worm moths, the males of this species have wings, but the females are wingless, or rather their wings are rudimentary, not allowing them to fly. The male is of a rusty buff or nankeen color with thin wings that expand about two inches. The fore-wings have two wavy, brown lines crossing them, the inner one sometimes being faint. The female is grayish or yellowish-white, sprinkled with fine black dots, and two rows of black spots down the back. The body is about half an inch long.

The moths hatch in the Fall, and, after pairing, the females deposit the eggs in little clusters on the trunk and branches of the trees. These remain in this condition till about the time the leaves are ready to expand in the Spring, when they hatch and feed upon the young leaves very much like the canker worms. They are larger than the latter and of a different color. When full-grown they are about 1¼ inch long, of a "bright-yellow color, with ten crinkled, black lines along the top of the back, the head rust-colored." The eggs hatch a little later than the eggs of the canker worm, and the worm is a little longer in coming to maturity. As soon as it has attained its growth, it lets itself to the ground by a web, goes down five or six inches beneath the surface where it forms for itself a little cell and changes to a chrysalis. It remains in this stage till the last of October or the first of November when the moth emerges and makes provision for another brood; very often, however, some do not hatch until Spring.

From the description it will be seen that the habits of this insect are very much like those of the Fall canker worms, and, as might be inferred, the same remedies may be resorted to in case they attack the apple trees. To prevent the eggs being deposited in the trees, tin or building-paper bands or whatever else is used, must be applied in the Fall. If the pests are found in the trees in the Spring, Paris-green in water thrown upon the tree with a garden syringe will destroy them. Probably this is one of the best remedies, as it kills all worms that eat the leaves sprinkled with it. If apples are growing thereon at the time, it might not be safe to use this, as it might become lodged about the stem and render the apples unfit for use.

The cut accompanying this, Fig. 493, gives a very good idea of this insect and its work, representing the male with the wings expanded, the female below, and the larvæ in different stages of growth on the leaves.

Carbondale, Ill. G. H. FRENCH.

Implements, &c.

Adams Direct-Draft Barn Horse-Power.

THIS power, brought out some years ago, has been greatly improved and perfected lately, and was exhibited in operation at the Michigan State Fair where it attracted a great deal of attention. As will be seen by the illustration, the power consists of a wooden wheel, hinged through the middle, suspended horizontally upon an upright shaft about three feet eight inches from the floor. The horse works inside the wheel. The shaft turns with the wheel; its upper end runs through a plank on the scaffold and a pin in the lower end works in a box on the floor. There is but little friction and but little oiling to be done on any part of the power. It takes up only twelve feet of room, and is especially adapted to the farmer who has feed to cut or grind, wood to saw, corn to shell or anything where a good, desirable one or two horse power is needed. It is simple and durable and, as it requires no mechanical skill, farmers need not fear to let their hired man or boy run it. When not in use, it can be quickly and easily taken down and set on one side, where it will not take up useful space. Its price brings it within the reach of all requiring a good power.

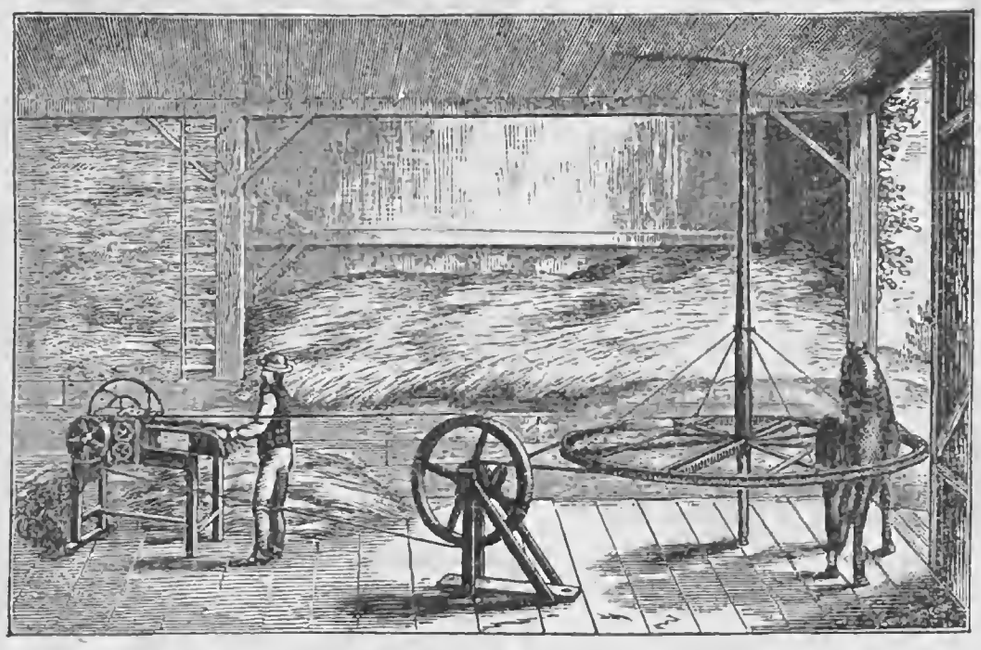


FIG. 474.

A Pulverizing Harrow Attachment.

Mr. H. Reynolds, Shiawassee Co., Mich., says of this device: When used in connection with a drag or harrow it is very effective in leveling, crushing and pulverizing cloddy and roughly plowed ground. It is made by fastening a 2x4-inch scantling underneath, and about the center of the harrow. Fastened firmly and unyieldingly it seems more effective than when cut in two in the middle. On top of the harrow put a weight, such as a rail or fence post, to keep it close to the work. This does not seem to add to the draft, and there is no clogging on strawy, corn-stubbly or cloddy ground; and the drag seems at least one-half more efficient with than without the device—quite an item in a busy time.—(See page 700.

Implements and Machinery.

Improved Cornell Corn Sheller.

FOR 1881.

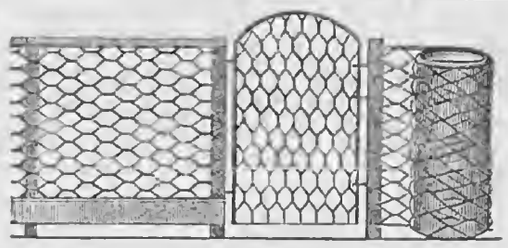
Will shell *more* corn with *less labor* than any other machine in market.

The only Sheller made THAT USES Spiral Springs for the Pressure Bar.

Every Machine Warranted to do as good work As any Sheller Made

☞ Ask to see the Cornell Sheller, try it and you will buy no other.

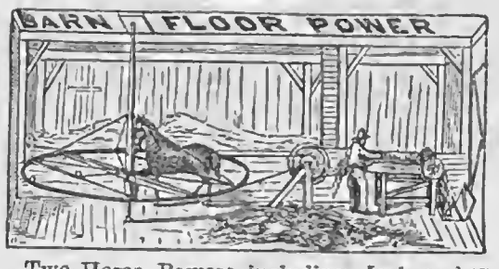
Address orders to TREMAN, WATERMAN & Co., Ithaca, N. Y.



The Sedgwick Steel Wire Fence

Is the only general purpose wire fence in use. Being a strong net-work without barbs, it will turn dogs, pigs, poultry as well as the most vicious stock, without danger to either fence or stock. It is just the fence for farmers, gardeners, stock-raisers, and railroads; very desirable for lawns, parks or cemeteries. As it is covered with rust-proof paint it will last a lifetime. It is superior to boards in every respect, and far better than barbed wire. We ask for it a fair trial, knowing it will WEAR itself into favor. The SEDGWICK GATES, made of wrought iron pipe and steel wire, defy all competition in neatness, lightness, strength and durability. We also make the BEST and CHEAPEST ALL IRON Automatic or SELF-OPENING GATE. Ask hardware dealers, or for price list and particulars address

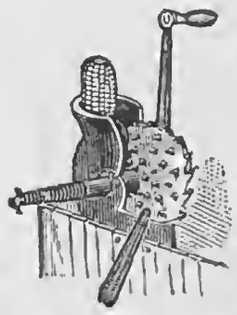
Sedgwick Bros., Richmond, Ind.



Two-Horse Powers, including Jack and 17 feet Belting, $40. Works in room 12x15. Larger sizes if wanted. Folds out of the way in five minutes. Very durable. Circulars free. Agents wanted.

SMITH & WOODARD, Kalamazoo, Mich.

THE WOODS CORN SHELLER.



PAT. NOV. 23, 1880.

It is the best, cheapest & simplest machine in the market. It separates the corn and cob, and remember it is warranted for 5 years if used in a proper way. Nearly 1,000 now in use and giving good satisfaction.

AGENTS WANTED

in every county in the United States. For terms and particulars address

ROBBINS

FAMILY WASHER

WASHING WITHOUT LABOR!

A WONDERFUL INVENTION!

IN 1871, Mr. H. R. Robbins, of Baltimore, invented and patented the now famous **Robbins' Family Washer and Bleacher.**

It was the original, and as now improved, the best and only perfect self-operating Washer in the world.

It will do all the family washing in less than half the time in which it can be done in any other way, without hand labor, with but very little soap, without chemicals and without any wear and tear or yellowing clothes.

More than fifty thousand of these Washers are now in use, giving perfect satisfaction. We have thousands of testimonials from all parts of the country—from Public Institutions, Hotels, Clergymen, Lawyers, Farmers, Editors and every class of people, and we have the Editorial Commendations of all the principal papers in the land.

In 1878 The Bissell Manufacturing Company purchased the patent for the Washer and after two years careful experimenting succeeded in simplifying the Washer, and in adapting it to use in any size and style of boiler as also in the old fashioned iron wash-pot so much used in the South (in which the original Robbins' Washer would not work) and obtained a reissue of their patent on the 21st day of December, 1880.

THE PRINCIPLE OF THE WASHER.

The operation of the Washer consists in rapidly and continuously forcing the hot soap suds contained in the boiler from the bottom to the surface, through a tube at the rate of ten gallons per minute and then drawing it down again **through the soiled clothing,** while that is expanded by the boiling heat—causing it to remove every particle of dirt and leaving the articles after rinsing, thoroughly cleaned and bleached. It is impossible for it to tear or wear, or in any way injure the fabric, as there is no friction whatever.

HOW DOES THE WASHER WORK?

The Washer having been placed in the bottom of the boiler or pot, as soon as the water commences to boil all that which is beneath it, being surrounded with heated metal becomes hotter and more expansive than that in the remainder of the boiler, and thus has a tendency to rise through the tube, while at the same time all the steam formed beneath the Washer is **forced** to pass out through the tube, and carries along with it the water in the washer and tube with great force, its place being supplied by the water outside, which is rapidly drawn into the washer and in turn heated and expelled, thus creating a constant and powerful current upward through the tube and downward **through the fabric, giving a water force** which cannot be obtained in any other way. The fabric being expanded to its utmost by the boiling water, the dirt, softened by the action of the soap, is at once swept away by the force of the flow.

Thus we have, 1st. The greatest possible heat; 2d. Perfect chemical action of the soap, and 3d. Force of water. All of which are necessary to thoroughly cleanse and purify any fabric.

What is it that cleanses the clothing in the ordinary modes of washing by rubbing, pounding, squeezing, drawing between rollers, etc.? It is the filling of the fabric with soap suds as hot as may be (**boiling** heat being unattainable, especially in hand rubbing) and then **forcing it out** again, and repeating the process until the clothes are clean. But all of these processes require **hand labor.** You must turn or pound, or squeeze or rub; there is little choice between them, while with the **ROBBINS' WASHER the labor is dispensed with** and any other work of the house may be done while the washing is **doing itself.**

THE CAPACITY OF THE WASHER.

There are two sizes, the No. 1 or family size, which works in any family boiler or wash-pot having a bottom 8¼ by 8 inches or larger, and holding 10 to 15 gallons of water. It takes only 3 or 4 ounces of soap to 10 or 12 gallons of water, will wash bed or table linen, a boiler full in 10 or 15 minutes, wearing apparel in from 20 to 30 minutes, without rubbing, and requires no previous preparation of the clothes, such as soaking over night. Take the clothes dry, and when the Washer gets *thoroughly at work*, fill the boiler as full as it will hold by gently pressing them down with a stick. Use no chemicals, only good soap and soft water. If the water is hard, it may be softened by a small piece of borax, which is harmless.

For Lace Curtains this Washer is *invaluable.* It cleanses them as no other process can, and without the slightest danger of injury.

No. 2, or small hotel size, will do the work in a boiler holding 15 to 25 gallons, and wash, of average pieces, from 1,500 to 2,000 per day; or it may be used in any smaller boiler. They will work in anything that has a bottom large enough for them to rest upon; say ten inches in diameter.

We also make a Washer 5x8¼ inches, suitable for use in sunken bottom boilers, and having the same capacity as our No. 1.

THEY ARE MADE OF SOLID BRASS, (except the tube), and can neither **rust, corrode, break nor wear out.**

QUESTIONS AND ANSWERS.

Q. What kind of boiler do you use? A. Any kind of a boiler will do.

Q. How can you have a flow of water at the rate of eight or ten gallons per minute in a boiler holding only eight or ten gallons? A. The same water is used over and over again; and in order to be thus used, it must pass down through and through the fabric; and this with the soap and heat is what does the work.

Q. How can you use a large quantity of water in a boiler already full of clothes? A. Fill the boiler two-thirds full of water; as soon as the washer commences to work, put in the clothes DRY.

Q. Can you wash flannels and colored clothes? A. We wash anything that can be washed. Flannels and colored clothes need but little soap, and from five to ten minutes of the full operation of the Washer. **Flannels should be rinsed in Hot water.** It is the change from boiling to COLD water that contracts the fiber, causing them to shrink. Any FULLER will tell you this is so. Fugitive prints will part with their colors by this or any process, but fast colors will not be injured.

Q. Can you use the common soft soap of the farm-house? A. Yes, if good.

Q. Is it not better to put very dirty clothes to soak over night? A. No; better not.

Q. Will your Washer remove the streaks from dirty wristbands and collars, such as farmers and mechanics wear, after they have been worn a whole week, as they usually are? A. The Washer will cleanse the dirtiest clothing. Unusually soiled portions may require a second operation to remove the dirt entirely. Give the clothes a thorough rinsing in hot water.

Q. How can it be possible for so simple a thing to cleanse fabrics? A. How is it possible for it NOT to cleanse fabrics?

Remember that the entire contents of the boiler are **forced through** the expanded clothing **every minute,** or at least twenty times at every washing, and you will see at once what the result **must be.**

Q. Will your Washer do all you claim for it?
A. Yes; it will. We guarantee this.

SAMPLE WASHER.

On receipt of **$3.50** we will send a single No. 1 Washer to any part of the United States, all charges pre-paid. No. 2, **$5.00.**

Cash must accompany all orders.

Remit by Post-Office Order, Registered letter, or by draft on New York.

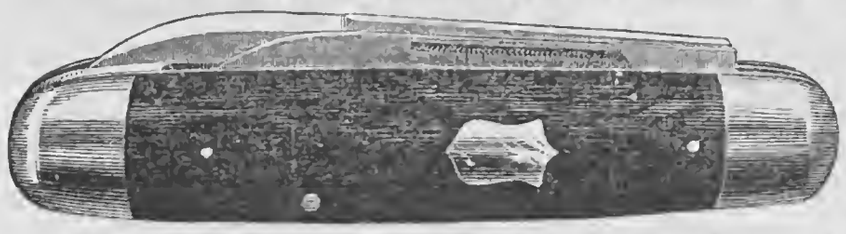
OLD FASHIONED HAND FORGED RAZOR STEEL KNIFE.



MAHER & GROSH, 30 Monroe St., Toledo, Ohio, to introduce their brand of cutlery (every blade warranted and replaced **Free** if soft or flawy), will send postpaid, knife like cut, strong blades and ebony handle for 75c.; or with 3 blades $1. We have 1-blade knife, 25c.; extra heavy 1 blade, 50c.; medium 2 blade, 50c.; extra heavy 2 blade made for hard usage, 75 cts.; **Our Best** 2 blade, every blade tested, $1. Boy's 2 blade, 25c Ladies' 1 blade, 25c.; 2 blade, 50c.; Gents' fine 3 blade $1. **Pruners,** oil temper and tested, $1. Budding knife, 65c.; Hunting knife, $1. Cattle knife, $1.; Sample 6-inch, hand forged, Butcher knife, postpaid, 50c. Illustrated list free. Liberal discount to dealers. Ask our Postmaster about us.

It is manifest that from GOOD SEEDS ONLY can Good Vegetables be obtained.

The character of LANDRETHS' SEEDS has been substantiated *beyond all question.*

They are the STANDARD for Quality.

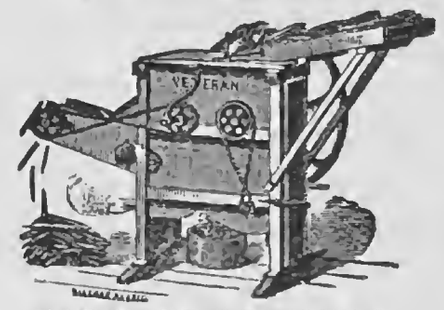
Over 1500 acres in Garden Seed Crops under our own cultivation.

Ask your Storekeeper for them *in original sealed packages* or drop us a postal card for prices and Catalogue.

Wholesale trade prices to dealers on application.

Founded 1784. **DAVID LANDRETH & SONS, 21 and 23 S. Sixth St., Philadelphia.**

Veteran Corn Sheller



FOR HAND OR POWER.

Just the thing for Mill, Farm and Plantation.

Power and Hand Corn Shellers of all sizes and to suit all wants.

HORSE POWERS, JACKS, Etc.

CARPETS.

AT RETAIL

By the Manufacturers.

We have now open an immense stock of Carpetings, including full lines of all the New Fall Patterns and Styles.

Being the product of our own factories, we warrant every Carpet as represented, and full satisfaction is guaranteed or the money refunded.

Axminster Carpets—We offer 300 pieces of these desirable goods at **$1.75** per yard, the same quality as sold last season at **$2.75.**

French Axminsters—A full line of our own importation at **$1.65** per yard.

American Moquette Carpets—400 pieces at **$1.40** per yard—the cheapest carpets ever offered. These goods cannot be found elsewhere in the city at anywhere near the price.

Velvet Carpets—The largest and best stock of Velvet Carpets in the United States at **$1.50** and **$1,60.** Extra good value.

Body Brussels—Best quality, full five frame, at **$1.25** per yard, special patterns at **$1.40** and **$1.50.**

Tapestry Brussels—A very large assortment of popular patterns at **75 cts.** per yard—same goods as sold elsewhere at **90 cts.** Finer grades at **90 cts.** and **$1.05.** A splendid assortment.

Ingrains—Extra superior quality—a very full line from **75 cts.** to **90 cts.** Also a good line of all wool ingrains from **65 cts.** to **75 cts.** yer yard.

Persia and **India Rugs** and **Mats** of our own importation, a large assortment at low prices.

BADGER STATE

Butter Color.

Received the only honorable mention granted to any Butter Color at the International Dairy Fair of 1879. If not for sale by your dealer, send for circular, &c. to the manufacturer, E. SHELDON, Fort Atkinson, Wisconsin.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME.

VOL. XL. No. 1656. NEW YORK, OCT. 22, 1881. PRICE FIVE CENTS $2.00 PER YEAR

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

The Herdsman.

OUR ANIMAL PORTRAITS.

Dutch-Friesian Bull Mooie (26).

CATTLE of the "Dutch-Friesian" breed and those of the "Holstein" breed are so nearly related and resemble each other so closely, both in appearance and beef and milk-producing good qualities, that they have been generally confounded in this country. The owners of cattle from the low-land districts of Friesland and North Holland, however, claim that it is from the herds of that region that all the other varieties of Dutch cattle have descended, and that in several points they so far excel all of these other varieties, or at any rate differ so far from them, that they are entitled to be considered a distinct breed. Accordingly they have given them the general name of "Dutch," indicative of their being the fundamental type of all the low-land breeds of cattle that extend through the Netherlands, Flanders, Holstein, Denmark, etc., and to this the word Friesian has been added, the more distinctly to locate the origin of the breed, and particularly to distinguish it from the other breeds of Dutch cattle. Under this name are included imported black-and-white piebald dairy cattle of North Holland and West Friesland and their pure-bred descendants in this country.

The distinctive suffix has been added by the American Association of Breeders of Thoroughbred Dutch or Friesian Cattle, which has lately published the first volume of the Herd Book of this breed. Of bulls this contains 44 in the Main Registry and 19 in the Appendix Registry; while of cows there are 185 in the former and 19 in the latter. The Appendix Registry is for youthful candidates for the Main Registry, to which they are transferred when, upon examination, it is proved that they have fulfilled the conditions for admission to it. The fulfillment of these conditions guarantees a profitable cow; for, in addition to their possession of undoubted purity of blood, only such females are admitted as the experience of the Association has found to be capable, under favorable circumstances, of producing 6,000 pounds of milk in the two-year-old form; 7,000 pounds in the three-year-old form; 8,000 pounds in the four-year-old form, and 10,000 pounds if over 4½ years old at the date of calving, and therefore classed as "aged" cows. Moreover, the Herd Book tells us that in many instances from 3,000 to 5,000 pounds of milk have been produced in excess of this standard.

In view, therefore, of this high requirement for entry into the Herd Book of the breed, and of the careful manner in which its fulfillment is ascertained, there is little wonder that the herds registered therein are gaining an exalted reputation as dairy cows wherever they become known. Of these herds the largest and most famous is that belonging to the Unadilla Valley Stock Breeders' Association, of West Edmiston, Otsego County, N. Y. As mentioned in our report of the Illinois State Fair, in our issue of October 15, this herd bore away all the honors in the Holstein class at Peoria, after having carried off the $500 sweepstakes prize for the best dairy herd at the Minnesota State Fair, at Minneapolis, after a sharp competition with 13 other herds, including Jerseys, Ayrshires and Devons. It will also be seen by our report of the St. Louis Fair, in this issue, that this herd carried off all the premiums in its class at that grand show.

In view of the fact that, for breeding purposes, the bull is half the herd, the importance of having a first-class bull can hardly be overestimated when improvement is the object or the prevention of deterioration in a prime herd. As "scrub" and grade males are always uncertain in their "get," the use of the best-formed of them is constantly resulting in worthless calves, owing to "reversion" or "harking back" to some poor progenitor of the sire. Thoroughbred bulls should therefore always be used, and these should be of that breed whose special characteristics it is desired to engraft upon the offspring. The Dutch-Friesian being, before all, a dairy breed, special care is taken that the bulls admitted to registry should be only such as are most likely to produce deep-milking heifer calves. Accordingly, in addition to purity of blood, each registered male must have a well-developed escutcheon according to the Guenon system—a system which is considered particularly valuable in aiding in the selection of a first-class bull. An excellent specimen of bulls of this breed is Mooie (26), imported and owned by the Unadilla Valley Stock Breeders' Association. He was bred by A. W. Oosterbaum, of West Friesland, Holland, and calved March 20, 1878; sire, Jan; dam, Durkje. In the Herd Book he is thus described:—"Evenly variegated, white face, throat, over shoulders and over hips; head and neck very fine; horns very small, waxy; shoulders low and finely formed; body very long and round; chine straight; hips smooth; rump very broad; quarters heavy; crops well filled; limbs short and fine; handling best; escutcheon best, with thigh ovals. Length, 68-22¾; width, 20½-20½; hight, 53-55; girth, 78. July 1, 1880."

DUTCH-FRIESIAN BULL, MOOIE.—FROM A PHOTOGRAPH.—Fig. 493.

OUR GOAT.

L. S. HARDIN.

I HAD taken a cottage near the city for the Summer, and among other novelties in possession of my neighbors were innumerable vagrant goats, whose peculiar ways of eating brown paper and old rags, and lying on the soft side of large rocks in preference to the dust of the road or the soft green-sward, enlisted my amazed curiosity.

There were no milkmen in our neighborhood, and buying milk of those who own but one cow is annoying and often disappointing, as no regularity of supply is guaranteed. They do not seem to know how to water regularly to keep the supply uniform. As an experiment I determined to buy a goat. As soon as this fact became known among the neighbors the price of goats went up about 50 per cent. From five dollars apiece good milkers immediately advanced to eight or ten dollars each. By cautious inquiry and adopting a knowing look, I finally got on the track of one that belonged to a poor man whose house had burned down a few days before. Being without a home, and as his goat was slightly aged and about to go dry, he parted with her for three dollars. I concluded this would be no great loss if I had to give her away. She gave milk enough for tea and coffee for my little family, and that was all we asked of her. At first it required two to milk her, one at the head and the other at the teats; now, however, she is perfectly gentle. After going dry about four weeks she dropped a kid, and from that time to the present, with plenty of grass, she has given regularly a pint of milk night and morning. We keep her tethered on the lawn, and only three or four times this Summer, as hot as it has been, have we been able to induce her to drink any water. The succulent grass seems to satisfy her thirst. We keep a stall in the cellar for her at night, which only needs sweeping out occasionally, for she is a wonderfully clean animal. The amount of food she consumes is inconsiderable.

The quality of goat's milk is not peculiar, as I was led to believe from the statements of many who were able to keep cows, having the conveniences for doing so. The only peculiarity about it in appearance and taste is its wonderful richness. For coffee it is far better than condensed milk, which we had used a long time, while the milk of native cows cannot compare with it in point of richness, nor do I think the full milk of the best Jersey equal to it, though Jersey cream is certainly richer.

From the best information I can procure from those who have owned our goat in former years, she must be close on to 14 or 15 years old. Her front teeth are entirely gone—worn down to the gums. She has every appearance of lasting several years yet. The kid, a "Billy," was wonderfully playful and affectionate, and when the milker stooped down to milk his mother he would take a running start and up the milker's back he would go until two feet rested on the shoulders and two on top of the person's head. This was his favorite position, and whoever sat down within his reach was sure to feel him clambering up his or her back.

Take it all in all, we are delighted with our goat, and when one considers, first, the low price of the animal—from four to eight dollars; second, the rough and common food she will thrive on; third, her absolute cleanliness; fourth, the extra richness and nutritive qualities of the milk, all this along with the little care necessary, when compared with that needed by the cow, the wonder is that the goat is not more popular everywhere. Goats breed in three months, which should give about three kids a year, and if a heavy milking breed can be procured, or a new milking breed be created, they should pay, for the trouble of handling, a handsome profit near a city, where the poor people of the suburbs appreciate them far more than their more exalted neighbors.

I notice that a Goat Club or Society has lately been organized in England, and I hope the members have turned their attention to establishing a breed of heavy milkers for city and cheese-dairy purposes.

Thoroughbred Stock vs. Common Stock.

A great deal has been said in our agricultural journals on this subject. Now I do not want to be understood as being opposed to thoroughbred stock by any means, for I am satisfied that we owe a great debt of gratitude to our most enterprising men all over the country for introducing it; but it is a word of caution that I want to give to good, honest farmers who, I fear, have been led astray many times by such flowery speeches as we sometimes see in print. They may think if they pay $500 for a Short-horn, or $100 for a Berkshire or Poland-China, or $200 for a South Down, that this will make their fortune. But let me tell them they must not stop

here. I can take the most common hogs of our country and in five years I can raise hogs that will compare with the best pure-breds, by carefully selecting and using the best for breeders, and being careful to feed regularly, feed well, keep clean and in well-ventilated quarters. On the other hand, I can buy the purest thoroughbreds and in five years, by neglect, they will be as bad as, or worse than, our most common stock. Good blood is all right, but in my opinion there is more in good, careful, regular feeding, thorough cleanliness and good ventilation than in anything else with all kinds of farm stock.

Harford Co., Md. JAMES HARRY.

Farm Topics.

THE TRUTH ABOUT IT.

THE object of articles under this heading is not so much to deal with "humbugs" as with the many unconscious errors that creep into the methods of daily country routine life.—EDS.]

THE VALUE OF MUCK.

How doctors differ! A few years ago Dr. Dana wrote a Muck Manual in which he made some enthusiastic but erroneous statements in regard to muck and manure. It is but a short time ago that the RURAL NEW-YORKER was taken severely to task by a correspondent who had more faith in Dr. Dana's theories than truth would justify, for stating that Dr. Dana's work on muck was full of errors. But now comes another doctor, Dr. Nichols, editor of the Boston Journal of Chemistry, who backs up the RURAL and says "that book (Dana's Muck Manual) is full of errors and absurdities." Here is a justification of the editor of the RURAL NEW-YORKER, which is certainly gratifying because we who pin our faith upon its s atements are glad to see it vindicated when these are questioned. But, alas! Dr. Nichols falls into the same muck delusion, as he calls it, but in a contrary direction, in regard to muck. This gentleman even fails to realize the difference between muck and mud, for he talks about "a substance holding 70 per cent of clear sand and 30 per cent of black mold" as being muck; and also of "a farmer digging muck out of a mud-hole." Again he says muck "holds no available plant food although it coutains some nitrogen."

Now the editor of the Boston Journal of Chemistry should know what muck is. I could send him a sample dug from a depth of five feet, that he would suppose was rotten cow-dung, and that contains nothing but decayed vegetable matter and which smells so strongly of ammonia as to be pungent to the eyes and nose when freshly dug. When burned, this muck leaves less than two per cent. of a light ash. In color it is brown; in texture it is fibrous and cuts under the spade precisely as well decayed manure made of straw and dung would do. It loses precisely 70 per cent. of water when dried at 300 degrees. Now this is what I call muck and what I know to be a valuable fertilizing material. I can see it forming every year under my own observation. An uncleared part of my swamp is now covered with a dense growth of weeds and bushes, which would amount to probably 25 tons per acre. The leaves and stems of these plants fall down and decay and have doubtless grown and fallen and decayed in this manner for centuries, making a bed several feet deep. There is no mineral matter in it but what has been derived from the ashes of the burned herbage when it has been occasionally consumed, for in the bottom even I find, when digging, charred fragments of stems and thin layers of black, carbonaceous material mixed with greyish, ash-like matter among the brown mass.

If Dr. Nichols is right, then a reclaimed meadow must be a useless piece of land. Every farmer knows different. The richest onion beds in existence are made from such swamps reclaimed and cultivated, and it has passed into a proverb—viz: "as rich as an onion bed"—that rich land is required for onions. The best corn and flax lands and the richest meadows are made from reclaimed muck swamps and the muck carted from the ditches has helped to fertilize the uplands.

Now what are plain farmers to do when doctors disagree so? Here is Dr. Dana who, so far as I know, was equally competent to form an opinion as Dr. Nichols who, I believe is a druggist just as Dr. Dana was, and he says muck is very valuable, and Dr. Nichols, on the other hand, says muck is worthless. What are we to do? Are we farmers to put our thumbs in our mouths and wait for the doctors to settle this matter, which, alas! they never will. We cannot wait for that. We have our muck swamps to drain and ditches to dig and we want to use the muck. A plain farmer, too, can tell Dr. Nichols something in regard to handling muck; for he does not draw it to the barn when it contains 90 per cent of water, but digs it in the Fall when it is driest, and leaves it in heaps until it contains less water than common manure; and then he hauls it to the barn-yard and fills the pens and yards and manure cellar and stables with it and saves all the urine of his stock by this means. And the plain farmer knows that the true value of muck is actually known among farmers, however it may be among chemists. In fact, when the Boston Journal of Chemistry says "the true value of muck is well understood among chemists *or at least it ought to be*," it admits that some chemists know nothing about it. And "which of these chemists are which?" How are we to distinguish those that know from those who ought to know, but don't? In the mean time we farmers think some of us know as much as some chemists do about the practical working of our farms on which we have spent our lives.

An old and contemptibly ignorant and conceited person once wrote "How can he be wise whose talk is of cattle?" and some persons in these days are apt to think very much the same. But there was a wise man who once wrote, "Doth the plowman plow all day to sow! Doth he open and break the clods of the ground? When he hath made plain (smooth) the face thereof, doth he not cast abroad the vetches and the wheat and the appointed barley and the rye in their place? *For his God doth instruct him to discretion and doth teach him.*" And if we consider that the universal mind, the intelligence of a thoughtful and observant human being is here referred to as the teacher, is not the farmer so endowed with discretion and taught, able to distinguish, after years of practical experience, what is good and useful in his own business as well as another man who never plowed a furrow or never put a spade into a bed of muck, or used a load of manure in a field and closely observed its effect?

The truth—which always lies between extremes—is, that real, genuine muck—decayed vegetable matter, which contains two or three per cent. of nitrogen—*can* be made to yield up its value to the soil and is so made every day by farmers who know that it is a manure as much as straw is, or leaves from the woods are, when it has been brought into the right condition as straw and leaves are, in the yard or manure heap, and the cornfield will prove it every time to a farmer who has muck and uses it. S.

The "Muck Delusion."

I was sorry to see an article in "W. O. S.," September 24, under the head of "Muck Delusion," in a measure indorsed by the RURAL, as I think it will do harm in giving lazy people an excuse for not composting their manure with muck or peat when they can get it. I know by experience that it makes extra work to put two loads of muck with every load of farm manure, and have nearly three loads of manure to haul and twice the amount of crops to harvest. I have been under the "muck delusion" more than 20 years, and am more deluded than ever. I could not account for the corn at the second hoeing being a foot taller in rows manured in the hill with a compost of one-third manure and two-thirds muck, than in the alternate rows manured with the same quantity of barnyard manure, until Professor S. W. Johnson found twice the amount of ammonia in peat that he found in barnyard manure. I believe, with General Noble, of Connecticut, that the only hope of a man on a sandy farm is his muck swamp, and I aim to compost all the manure I make, and I succeed in deluding the crops as much as I do myself.

Oswego Co., N. Y. S. M. JEWELL.

[The RURAL by no means indorses all that appears under the heading "What Others Say." It merely wishes in that department to tell its readers the chief matters of interest or importance discussed by others.—EDS.]

Cheap Ensilaging.

In the RURAL of October 8, Horticola asks whether any experiments have been made in making cheap silos, and in reply I would say that Dr. Faxon, of the Sailors' Home, Quincy, Mass., ensilaged a large quantity of corn last Fall simply by digging a trench six feet deep by eight wide and as long as he required. The corn was not cut up, but laid in all one way and well trodden down. Before he commenced putting in the corn he set posts against the sides and ends of the trench or pit. Against these he laid rough boards; put in his stalks which held the boards in place. The earth was packed in between the boards and the ground. When the pit was filled four feet above the top, it was thatched by putting straw on top, and the rest of the dirt was put on it. The silo was opened in March, and the Doctor said that for all he could see it was as good as Dr. Bailey's of Billerica, Mass. This year he has put in a lot in the same way.

E. BENNETT.

COVERING WEEDS WITH A PLOW.—Mr. A. E. Boyce writes us from Hennepin Co., Minn., that the chain attachment to a plow, for covering weeds, described in the RURAL of August 20, and in the RURAL of Sept. 17 said to have been patented in 1866, and again referred to in our last issue, was fully described as long ago as June and July 1851 in the Wisconsin and Iowa Farmer and Northwestern Cultivator, published at Racine, Wis.

Field Crops.

THE POTATO CROP.

THE POTATO CROP FOR 1881 is estimated by the Department of Agriculture at about 68 per cent. of a full yield. South of latitude 40 potatoes are almost a failure, and even in some parts of Illinois and Kansas there will be scarcely enough for home consumption. Since a comparatively small area is ever planted to this crop, any shortage, caused by insect pests, drought or rot is all the more severely felt. The fact that there is oftener a scarcity of this crop than of almost any other and a consequent higher price, should encourage a larger cultivation, and thus, in unfavorable seasons, we should escape positive want in this important article of food. While there has been a great improvement in machinery for the cultivation and harvesting of other crops, there has not been so great progress in adapting labor-saving machinery to the cultivation of potatoes, and in this fact we may find one reason why a smaller acreage is devoted to them, than to corn, wheat or rye. There is a great deal of manual labor to be done in the potato field if one would attain the best results, and the average farmer prefers to raise those crops in the cultivation and harvesting of which he may have more aid from horse or steam power. Notwithstanding the labor required and the injury to the crop from insect pests, etc., in view of its importance as an article of food, of its frequent scarcity and consequent high price, it would seem to be to the farmer's advantage to increase the acreage of this crop wherever land is well suited to its growth.

The value of the potato crop may be seen by comparing the average value of the yield per acre for ten years from 1870 with that of corn, wheat, rye, oats and barley. The U. S. Statistical Abstract gives the annual average value of the corn yield per acre as $11.54; of wheat, $13; of rye, $9.02; of oats, $10.03; of barley, $16.27 and of potatoes, $49.31. This shows that the potato crop will return the farmer a much larger sum per acre than any other of the crops mentioned, and that is an item to be considered. A word on the

GATHERING and storing of the potato crop is now in season. I have quite frequently met men who seemed to think that the potato possesses some inherent quality which will preserve it sound and healthy for an indefinite time under any conditions or circumstances. Such men will, perhaps, go into the potato field just after a rain, throw out the tubers from the ground, muddy and wet, remove them to the cellar or elsewhere in a damp condition and, naturally enough, their potatoes decay before the Winter is fairly begun. Then down come execrations on the potato bugs, the weather and even the variety of the potato itself, which should have possessed better keeping qualities. It is a mistake to dig potatoes when the soil is wet, and then store them in such condition. It is time and money lost in the end. I speak now of those farmers (and they comprise a very large class) who raise only enough for their own use, or who dispose of what they happen to have left over early in the Spring. Dampness favors the potato rot, and if this one trouble can be checked it will make a very noticeable difference in the marketable potato crop throughout the country.

Carelessness in digging is another thing to be avoided; when potatoes are all hacked up with the hoe or fork, they are on the way to the pig-trough; that is to say, they will soon begin to decay and will be assorted out for the pigs during the Winter. The proper time to assort them is when they are picked up, and unsound ones should not be placed in the bin or trench with the sound ones under any circumstances. They will prove to be bad company and, like bad human company, they will corrupt their associates. A little care in placing the fork, in digging, will prevent much mischief later. Of course, where the plow or potato digger is used, similar care will be profitable, but these have not, as yet, superseded the old, back-breaking hoe. Potatoes, dug with care and when the soil is dry and removed to the cellar or pit without too long exposure to the sun, may be said to have a good start for the Winter.

STORING.—Those men who do not make it a practice to market their potatoes in the Fall, are often nonplussed as to how to store them so as to insure the most perfect results. The mound system has its advocates, so has the pit or trench method, but if a man has a good cellar under house or barn, frost-proof yet cool and dry, in my opinion he has a good place to store his tubers. The cellar has certainly this advantage, that in case the potatoes *do* rot, it may easily be known and the offending members may be removed, whereas the trouble may not even be surmised, and, if so, not remedied, until Spring, if the tubers are out-of-doors. It is not very satisfactory to find, on opening a mound in the Spring, a reeking, odoriferous mass of rotten potatoes, many of which might have been saved if the difficulty had been known. I do not say that potatoes never decay in the cellar or that they never keep well in a mound or pit, but th chances for keeping are, in my opinion, in favor of the cellar. With proper care, the potato crop, though a hard one to raise, is, nevertheless, as a rule, a paying one, and is worthy of more extended cultivation.

J. W. D.

TOBACCO-GROWING NOTES.

TOBACCO stalks make an excellent fertilizer for general farm crops. They are most conveniently utilized by applying them broadcast over pasture lands where their influence may be clearly seen from the increased vigor of the grass growing about the stalks. This grass is greedily eaten by most kinds of stock and seems to be relished in preference to that grown where other manure has been used. The stalks may be spread evenly over sod ground to be plowed down for corn or potatoes. When applied to tobacco ground, they should be cut up with a hatchet or feed-cutter and applied as other manure. In order that all of the strength from the stalks may be utilized, they should be applied to the soil in the Fall or as soon as they are freed from the leaves. When piled up in the open air exposed to storms, the elements most valuable as fertilizers are readily washed away.

WHEN it is desired to use coarse manure for tobacco, it should be applied as early as possible in the Fall and plowed under before Winter. Two additional plowings in the Spring, making three in all, mix the manure thoroughly with the soil. If the manure is well rotted, it may be applied as a top-dressing in the Spring with better results, I believe, after the soil has been plowed and harrowed and preparatory to the final fitting for the plants.

A TOBACCO grower in Tioga County, Pa., reports to me favorably of the use of hide scrapings or tanners' refuse as a tobacco fertilizer. A personal examination of his tobacco grown on soil manured with the scrapings, revealed no unfavorable symptoms in the quality of the leaf. The growth of the plant was large, but I was informed that there was danger of applying it too thickly when the tobacco is in a green state, as my friend had found from experience. The best results had been obtained from the refuse when mixed and applied with stable manure.

IT is generally advisable to plow under manure that is applied in the Fall. If left on the surface it is liable to become leached and washed by the heavy Autumn and Spring rains or during the "break-ups" of Winter. I have frequently seen water made black from having leached through manure, running in a stream from a Fall manured tobacco field. The loss at such times is great and should never be allowed a second time.

IT is not best to be in haste to take tobacco from the poles or laths, and to strip the leaves from the stalks. Let the natural juice from the leaves escape and the butts or stems become thoroughly cured before taking down the plants. This will avoid danger of stem-rot while the tobacco is in the "pack," provided the stripping is done as soon as the plants are taken from the poles. G. A. G., JR.

Chemung Co., N. Y.

Flax Raising in Kansas.

I have had experience in flax culture both in Illinois and Kansas, and find the soil of Northeastern Illinois and this Southeastern part of Kansas is well adapted to flax raising. I prefer new land, say the second or third sod, so as to have it free from weeds. I plow my ground as early in the Spring as possible, (but one should not plow it when too wet); then I harrow and roll until it is free from clods; then I sow about the middle of April. I always sow 10 quarts per acre with a broadcast seeder. It will mature in about 60 days. When ready to cut, the bolls will be brown, and the straw of a yellowish cast. I always reap with a self-rake reaper; let it lie half a day in the sun; then it is ready to stack. I let it stand in the stack until about the first of October when I thrash it and keep my seed until Spring, as I can generally get a better price about sowing time. The average yield per acre is about 10 bushels. Of late years the price per bushel in the Spring is from $1 to $1.25. The cost per acre for raising, count-

ing seed and liberal wages for all work from plowing until the crop goes to market, I find to be about $4.50. F. R.
Cherokee Co., Kansas.

Raising Flax in Kansas.

I have raised flax to some extent ever since its first introduction into this county and, I think it yields best on high, prairie soils. I plow either in Fall or Spring and harrow till the ground is mellow and level. I sow broadcast half a bushel of seed per acre and harrow once. When most of the pods are brown I harvest with a Champion Reaper; let it lie on the ground eight or ten days and it is ready for thrashing. The yield has been about ten bushels per acre on old ground and eight bushels on new ground. It is worth from 80 cents to $1 per bushel. The straw is worth about the same as wheat straw for feed. The expense per acre for raising flax has been, in my experience, from $3 to $4. J. W. M.
Coleville, Kansas.

Horticultural.

HOW TO MAKE AN ASPARAGUS BED.

PETER B. MEAD.

THE asparagus (Asparagus officinalis) is one of the oldest inmates of the garden, and was quite as much esteemed several hundred years before the Christian era as it is to-day. Its cultivation, I am inclined to think, has come down to us through the long line of ages, somewhat enveloped in mystery and superstition.

The directions sometimes given for making an asparagus bed are so elaborate, laborious and expensive, and some of them so entirely without any good reason in the nature of the plant, that I shall make no further allusion to them, but confine myself to the simpler methods now pursued in the garden and in the field. So far from an asparagus bed being an expensive luxury, I shall show in the end that no man is so poor that he may not have one, provided he has a small plot of ground on which to make it. At present I shall confine myself to the garden.

THE SOIL.—It is undoubtedly true that a light loam or sandy soil is the best for our plant, and a heavy clay about the worst in its natural condition. The soil should be free from standing water. There are few homes where such a spot cannot be found. The best asparagus sent to the New York market is chiefly grown on light sandy soils contiguous to the seashore, and in such places the plant is often found growing wild. A heavy loam will be much improved by the addition of a liberal quantity of sand.

MANURES OR FERTILIZERS.—In the preparation of the bed I confine myself exclusively to old, *thoroughly rotted* barn-yard manure, which has not had its chief goodness washed out by rains. Special or artificial fertilizers will find their proper place on the surface as top-dressings when needed, though even then I prefer the barn-yard manure.

PREPARATION OF THE SOIL.—This is done by trenching with the spade, which is a rather laborious operation, and consists, as usually done, in reversing the soil or placing the good soil at the bottom and the poor soil on the top, mixing in the manure as the operation proceeds. The following method, however, involves less than half the labor, and I have found it to be quite as good, and in some cases better. First, mark out the size of the bed, and then mark off a piece about three feet wide, and from this piece remove all the top soil to the depth of the spade, or about one foot. Next cover this open space or trench with from four to six inches of manure (according to your supply), and dig it in the subsoil, mixing the subsoil and the manure well together. If you can get some leaf mold, two or three inches of this dug in with the manure will be a valuable addition.

The next operation will be to spread from four to six inches of manure over the whole of the bed that has not yet been disturbed. Then mark off another piece three feet wide, and throw the top soil, to the depth of a foot, into the open trench mixing in the manure while doing so. There is now another open trench three feet wide, which must be covered with manure and spaded up as before directed. These operations must be repeated until the whole bed has been trenched, the last open trench being filled with the top soil that was dug out of the first trench. The surface soil, it will be seen, still remains on the surface, while the subsoil has been stirred and enriched with manure. This preparation I have found to produce quite as good results as when the soil has been trenched to the depth of three or four feet, with the subsoil brought to the surface, as is commonly recommended; and in some soils I think a foot-and-a-half quite enough. A little leveling and a thorough raking will leave the bed in good condition for the reception of the plants.

PLANTS AND PLANTING.—There is a difference of opinion as to the age of the plants to be used. I have settled down to the conviction that there is nothing better than well-grown plants one year old. They are certainly less troublesome to handle than those that are older and may be cut quite as soon. There are two methods of planting more or less commonly practiced. One consists in opening a trench about one foot wide and six inches deep, and spreading out the roots on the bottom in a natural manner; the other consists in cutting an edge perpendicularly along the line, and laying the roots along this edge somewhat fan-fashion, dividing the roots pretty equally on each side of the crown. In either case the crowns should be placed about six inches beneath the surface. The first is the better method though involving a little more labor. The trench in either case should be only half-filled up till the plants have got well above ground, when the trench may be filled up level.

DISTANCE AT WHICH TO PLANT.—On this point opinions and practices have undergone a considerable change during the past ten years or so, the tendency being to increase the distance, and, perhaps, to run into an extreme, to the waste of land. All are pretty well agreed, however, that the rows should be from three to four feet apart in field culture, the latter distance finding much favor in sandy soils. Wide planting in the field has manifest advantages in the use of labor-saving implements, and the plants yield better and live longer than when huddled together in the old way. In the garden, however, I prefer closer planting, say two feet apart for the rows and a foot-and-a-half between the plants in the rows as the minimum distance. For large-growing kinds, like Conover's Colossal, I would increase these distances six inches and a foot. The planting may be done in the Fall or in the Spring, and it is well to prepare the beds in the Fall even if the planting should not be done until Spring.

For field culture the ground is generally prepared by using the subsoil plow, the aim being thorough and deep preparation and a liberal use of manure.

MAKING BEDS FROM SEED.—I have already reached the limits assigned me, but I must, nevertheless, add a few words about my experience in making asparagus beds from seeds, which to some will probably be the most useful part of this article. I will do it with all possible brevity. I have really never had better beds than those made by sowing the seeds where the plants are to remain, with a gain of a year at least in the time of cutting, besides the saving of much labor. The bed being prepared as above directed, stretch a line and draw a drill six inches deep, throwing the earth on each side like the furrow made by a double mold-board plow. This drill can easily be made with a spade, the soil being drawn or pushed to either side till the required depth has been reached. The drill should be six inches deep measuring from the *level* surface of the ground, and not from the top of the soil thrown out in making the drill, as is commonly done in making drills. Sow the seed in this drill, and cover two inches deep. When the plants are about three inches high, thin them out to the proper distance apart, and gradually fill up the drill as the plants increase in growth.

This is a simple way of making a bed, and the second year the growth of the plants will surprise you. If you have choice seed, and not much of it, look it over carefully, reject all that are bad, and then put two or three together at intervals of 18 inches or two feet, or where a plant is to remain, all but one being pulled up when two or three inches high. If the surplus plants will not come up without disturbing the roots of the one that is to remain (as is often the case), they should be cut out. In this way a small quantity of seed may be made to go over a large bed.

If your bed has not been prepared, and you wish to sow the seed for future use, enrich a piece of ground, draw drills a foot apart and two inches deep, sow and cover the seed, keep the bed clean, and transplant to a prepared bed when the plants are a year old. The seed should be sown as early as possible in the Spring. Late sowings sometimes fail. Begin weeding as soon as the plants can be seen.

The space between the rows of young plants in a new bed of asparagus may be utilized by growing a crop of lettuce, radishes, beets or other low-growing plants; but it is not wise to continue this beyond the first year, except for the radish and lettuce. These plants must be kept well away from the asparagus, and the bed kept entirely free from weeds. A good deal of the future success of the bed will depend upon a free, uninterrupted growth during the first year.

I hope I have simplified somewhat the manner of making an asparagus bed. Its future care and treatment, however briefly told, would require space enough for another article, which I may give if it should be deemed necessary. [Please.—EDS.]

RURALISMS

IS IT to be a real outgrowth of a genuine love and taste for flowers in their simple and natural beauty, or only a craze or a passing fashion? Be that as it may, another "weed" has found a place in the ladies' corsage. The Golden Rod (Solidago) has been freely used by ladies during the past Summer and Autumn for belt and corsage adornment, and I am bound to say that I have seldom seen them use any flower in a more graceful and becoming manner, especially when the complexion and the dress harmonized with the color of the flower. I remember one case where I thought the arrangement simply exquisite, being influenced, it may be, by the fact that the young lady was very beautiful and dressed with rare good taste. I am trying to think how far it will be wise to encourage this sort of thing with the ultimate view of making some kinds of weeds rare. The thought is rather perplexing.

THE Fair of the American Institute is now (Oct. 3) under way. On September 3d the first weekly floral exhibition was held. The terrible drought marred it greatly, and the horticultural exhibits generally were not up to the usual standard; but there were two objects of such rare excellence and so rarely seen in good form as to make up for many shortcomings. These two objects were a *real* dinner-table design and a funeral design. The New York florists make up some very beautiful things, and their mechanical execution is worthy of all praise; but their conceptions of what a dinner-table design should be are greatly at fault. Mr. Davidson, two or three years ago, at an exhibition of the New York Horticultural Society, presented a dinner-table set conceived in the best taste; and now Miss Lizzie Bennett, of Brooklyn, exhibits at the American Institute a center-piece for the dinner-table conceived with rare good taste and finished up with those light and graceful touches which it is generally supposed only a woman's hand can give. It was just what a dinner-table piece should be, light, airy and very graceful, and that is all that need be said. In dining out nothing can be more provoking than to be seated opposite a lovely and entertaining woman and be divided from her by a great, solid mass of flowers that you cannot see through, or over, or around; and it is almost as bad to have a great mass of flowers sprawling all over the table, sadly interfering with all comfort and pleasure in eating.

IT so happened that the funeral design alluded to above was also from Miss Bennett. This design was the very perfection of simple beauty, being neither more nor less than a cross with diagonal arms, camellia leaves, and the white, fragrant flowers of Eucharis Amazonica; but a pure taste had given to these few and simple things such a grand expression of grace and fitness as to make one feel that it was altogether such an offering as the loved living might place on the grave of the loved dead without offense to God or man. It was so different from the great, clumsy, uncouth, expressionless objects that too often mock the solemnity of the grave, that it is worth while to stop a moment to notice it. It was the best funeral design I have ever seen. A score or two of men might take the same material and copy the design, and yet fail to fully produce the same effects. The hanging of the festoons of the Eucharis would be their weak point, while it was Miss Bennett's strong one. I hope they will try, however.

I HAVE noticed with pleasure that the Sheldon Pear has been growing in favor with the public for several years past. This Fall it has been abundant in the New York market, and has sold well. It is one of our best pears, and deserves all the favor it promises to receive. Every year the pear is becoming a more popular fruit.

I AM indebted to my old friend Mr. Wilder for an early copy of his address before the late meeting of the American Pomological Society. It is evident that age has not abated one jot of his interest in the great work of his life. The address is written with all the vigor and enthusiasm of youth. HORTICOLA.

REMARKS AND COMMENTS.

I REGRET very much that I have not the pleasure of being personally acquainted with "Horticola," as from his instructive notes in the RURAL I consider him one of our most skillful horticulturists, as well as a close and very accurate observer. On this account I dislike to "cross swords" with him; but what does he mean by saying that "roofing slate and cedar shingles make the best mulch for strawberries he ever used?"

WILL "Horticola" please be so good as to give a few notes descriptive of the Caroline Raspberry? How does it compare with the other varieties in hardiness? Has it been tried at the Rural Farm, and if so, with what result? [It is one of our most hardy and productive kinds, and there is scarcely another raspberry—certainly no other yellow variety—that we more confidently recommend to Mr. Parnell and to our readers in general.—EDS.]

THE SPANISH CHESTNUT is rather tender when young, and in such a severe Winter as the past one it must be expected to be injured, especially when grown in an exposed situation; but when the trees become large they pass through our severest Winters without sustaining any injury. I advise all who contemplate planting this chestnut to plant in the Spring. Cut the trees severely back and give them a thorough mulching before the middle of May, and be careful to select good and strong plants with an abundance of fibrous roots, if planted in an exposed situation. Small trees will do well if planted in a sheltered place, provided grass and weeds are not permitted to grow around their roots. In good garden soil this species grows with the greatest rapidity. I have a tree that is over 20 feet high, which I raised from a nut planted in the Fall of 1875. This has received no special care or attention. I have also a noble specimen over 40 years of age, which is over 38 feet high, with wide-spreading branches; it measures 11¼ feet in circumference one foot from its base. The fruit is large, but of rather poor flavor when eaten raw. Before it is eaten, however, it should be cooked, which considerably improves the flavor.

OUR native chestnut trees have only a very few burrs on them this season. Chestnuts will be very scarce in this vicinity.

HORTICOLA remarks, page 562, that strawberries rotted badly the past season on account of the wet. Mine were mulched with wheat straw, and it would have been a difficult task to have found a rotten berry, excepting those the birds injured.

IT SEEMS very singular why the Ott Pear is so very variable. I have three trees from which I obtained three bushels of excellent pears, so far as size is concerned. Of these 2½ bushels were of fine flavor, while the other half bushel, obtained from another tree, were worthless on account of their indifferent flavor. As my trees are not over 600 feet apart, and are in all respects treated in the same way, I am at a loss to account for this difference. Can it be that it arises from having two varieties of this pear in cultivation, or is it due to local causes? The tree is of moderate growth and remarkably productive. The fruit is small, of a greenish-yellow marked with russet, and of a rich, sugary flavor.

ON AUGUST 26 I picked all my Rostiezer pears. From one small tree I obtained three pecks of fine fruit. It is of medium size and of an exceedingly sweet and pleasant flavor. The tree is of vigorous growth and a profuse bearer. In season from the middle to the end of August. The size and quality of the fruit are greatly improved by judicious thinning when the fruit is about half-grown.

WITH the exception of Seth Boyden, all the other varieties of strawberries continue to stand the drought remarkably well; but I think that young plants will be scarce next season, in this vicinity at least; my plants are producing no runners.

THAT excellent pear, the Wadleigh, I think originated in New Hampshire. Be this as it may, it is an excellent sort and should be brought prominently into public notice. Indeed, I do not recollect seeing the name even mentioned in the nurserymen's catalogues or horticultural publications, but I am in hope that this brief note will induce some of our amateurs at least to give it a trial. I am certain that they will not regret so doing. The tree is of vigorous growth and is remarkably productive. The fruit is of medium size and of a roundish shape, with a beautiful yellow skin and a rich, juicy, delicious flavor. It is in season the last week in August. [J. J. Thomas speaks of it as "melting, juicy, very good. Origin, N. H." A. J. Downing says of it:—"Flesh white, fine, a little gritty, juicy, melting, pleasant; September. Origin, N. H." —EDS.] CHAS. E. Parnell.
Queens Co., L. I.

Testing Tomatoes.

Being desirous of testing tomatoes as to earliness, adaptability to market, etc., I purchased, last Spring, in New York of the leading seedsmen, a packet each of 30 varieties,

embracing nearly all now offered to the public. Little Gem ripened 10 days in advance of all others. Red and Yellow Cherries came next in order. For market Acme and Livingston's Perfection take the lead, being very smooth, of good shape and ripening all over without green spots. Excelsior and Arlington are also fine tomatoes for market. To those who like a yellow tomato I would name Golden Trophy and Green Gage as the best of their color. Conqueror failed to conquer a single point, dropping all its fruit as it began to color. French Erect or Tree Tomato stands erect about 18 inches high and has set some fruit which has not ripened at this date. [They are very late, irregular in shape, and have little to commend them.—EDS.] I have raised 15 bushels of sweet potatoes of Bliss's Early Golden, Peabody and Southern Queen. Early Golden, nearly white, and Peabody, red, are about the same in point of earliness and productiveness. O. L. H.

Springfield, Mass.

The Vineyard.

THE NIAGARA GRAPE QUESTION.

MR. BENSEL'S REPLY TO MR. WOODWARD.

TAKEN severely to task by the Secretary of the Niagara Grape Company in the RURAL of the 1st instant, because I had the temerity to express, in a previous number, an opinion adverse to the interests of that Company, it seems necessary that I should say a few words to set myself right before the public.

I am "a plain, blunt man," not a propagator, and I have no money interest in any fruit specialty. My garden is a city plot, "thirty-five feet front," in which I grow a few grapes, a few peaches and a few pears; but my experience with fruits has been gained only by long, close observation and the spending of much money. Thus much can probably be attested by the veteran, Mr. Peter B. Mead, and one or two of my neighbors not unknown to pomological fame. So, the grand hits which the Secretary imagines he has made fall harmless to the ground.

The main point which I insisted on in the previous article, was that objectionable fruits should not be imposed upon the public simply because of the ignorance in regard to better varieties. We have plenty of the "good-enough-for-market" grapes before we come to the Niagara. The Concord and Hartford Prolific are of this sort, and they are *cheap*, as growers are now finding to their cost.

The "vineyard not far from New York"—only seventy-five miles—was visited by myself and a friend a few weeks since. As yet it is only a *plantation*, the roots having been set out last Spring. Mr. Rogers, the owner, is a gentleman, and should not be drawn into controversy. He has a right to spend his money as he chooses, and he certainly has large faith in the *selling qualities* of the Niagara Grape. He brought to the Highland Fair a basket of Niagaras direct from the grounds of the Company, which I thought were not ripe, and so exacted from him a promise to mail to Mr. Downing a cluster picked from the vine on the 15th of October. The Niagara is not an early grape, and would not be better if possessing that peculiarity; for, if left late on the vine, it may pass a portion of its foxiness into the air, but there will be enough remaining, according to my experience of last year, to place it far outside of the list of good grapes. If my offense has been rank in disclosing serious objections to the Niagara Grape, it must have arisen from handling so rank a subject without gloves.

The fling of the Secretary at Hudson River seedling grapes he must himself consider in bad taste, when he recalls the richness and fine qualities of the Iona and Israella, the Quassaick and Jefferson.

I will only add that exhibitions of spleen towards individuals, like that shown by J. S. Woodward, Secretary, etc., give no additional weight to argument, and are not generally employed by the gentlemanly correspondents of the RURAL NEW-YORKER.

Newburgh, N. Y., A. A. BENSEL.

[It always seems to us that where earnest, honest agriculturists or horticulturists are aiming to place the truth before the public, there need be no personalities or unkind feelings entertained or expressed, even though a wide difference of opinion exists. EDS.]

WE saw several bunches of the Pocklington Grape one day last week. The bunches and grapes were of extra-large size and the quality decidedly better than that of the Concord.

FOREIGN AND AMERICAN WINES.

Reply to a "Trade" Journal.

"THE American Wine and Grape Grower" makes objection to our remarks made some time ago on the subject of the purity of foreign wines, or rather their impurity, as compared with the product of our native vineyards. We profess to be surprised at the statements made by our respected contemporary, which claims by its name to represent the interests of American grape growers and wine producers rather than those of the dealers in foreign wines. As to the figures given by us representing our native wine product, viz. 6,000,000 gallons yearly, we have only to say that it is an estimate based on the reports of the Agricultural Department and not upon bare guess-work. In 1870 the product was reported at 3,000,000 gallons, and it would be a hazardous guess, which would make our product to be "25 to 30 millions annually of *late years*." Such a surprising jump from 3 to 30 million gallons at a bound, is quite beyond the probability, and we prefer at present to consider our own figures, viz.: Six million gallons, to be correct, rather than those of the American Wine and Grape Grower. If we should be wrong, we should rejoice to know that this industry, at present beyond reproach, has flourished so amazingly.

But the main point involved is still more clearly correct, as we have stated it. The evidence is unimpeachable. Common report, based upon incessant statements in the public prints; common knowledge of supporting facts; the confessions of foreign journals interested in French agriculture and viticulture, etc., and we might mention, the frequent advertisements in technical papers of flavoring, coloring, and reinforcing substances used in the trade, that prove to outsiders even what is going on within—all support our statement, which in fact was but mildly put.

Further, we have personal knowledge of foreign persons who have introduced into this country the business of manufacturing wines of various sorts from the basis of common alcohol, elderberry juice, gooseberry juice, and other stuffs and coloring and flavoring matters, and who occasionally appear as advertisers in newspapers for partners with capital to carry on this business. This is not an American industry. It did not grow here, although since its introduction it has taken root extensively and is engaged in supplying this market with "French" wines which were formerly imported. A reference to the files of that excellent journal, *Journal d'Agriculture Pratique*, would show conclusively that the fraudulent manipulation of wines is a constant industry in France, and that that journal has taken frequent occasion to remonstrate with French vineyardists against the general practice of coloring their wines with a poisonous substance derived from aniline, and which is declared to be destroying the French wine business. We don't feel inclined to disregard the report of the examinations made by the Parisian authorities to which we referred. These examinations were not confined to the common saloons, *cafes, cabarets* and wine-shops, but to all places where wines were sold, both of high and low degree, and they are therefore fair and impartial evidence upon the case.

Lastly we *know* from our own personal knowledge gained some years ago at the centers of the French wine productions, when virtue had not fallen to so low an estate as it now has, that unusually poor wines were largely made up for foreign markets, and in one especial case we recall a knowledge of a cargo of Bordeaux wines shipped to New York, which were invoiced at the impossible price for pure wines of 75 cents the dozen bottles. We by no means wish to represent all French wines as "sophisticated abominations," but knowing many facts regarding the scarcity of really pure wines, and believing the statements of responsible French journals, we prefer to decline "to take any French in ours" so long as we can procure American wines that have not yet come under the manipulators' hands. And so long as we can believe that our wines are pure we should prefer them for ourselves, were we to drink wine at all, and advise others to prefer them for their healths' sake as well as for patriotic and philanthropic motives. We regret to have to differ with the American Wine and Grape Grower upon a matter of such serious importance as this of which we are telling only the bare truth. But the truth should be told.

The Swine-Herd.

WINTERING PIGS.

THERE can certainly be very little profit in having pigs come in the Fall and being obliged to feed all Winter and Summer, or a whole year before fattening for market. Pigs that come early in the Spring and are pushed along all Summer and Fall and are ready to market in December, pay the best. This is especially true when feed is scarce and high. Last year this was the case—a partial failure of the corn crop made feed rather high and pigs that were kept over and have to be fattened now, at present prices of corn and pork, will prove a losing investment. Corn at the present time is selling at 65 cents a bushel and pork brings five-and-a-half cents per pound gross, so that there is an exceedingly small profit in turning corn into pork, and pigs that have been kept over will hardly pay for their feed.

Pigs cannot be stunted except at a loss. Stunt them once and they never fairly recover from it. To make a profitable business of pig raising and fattening, they must be kept growing from the start, or you are losing money all the time they are not growing, and the larger the pigs or hogs are the greater is the loss. When feed is as high as it is at the present time, there is not only great danger of slighting, but almost an irresistible temptation to feed as little as possible, and in this way stock will not make the growth they should, and when this is the case there is a per cent of loss that no amount of extra feeding afterward will fully make up.

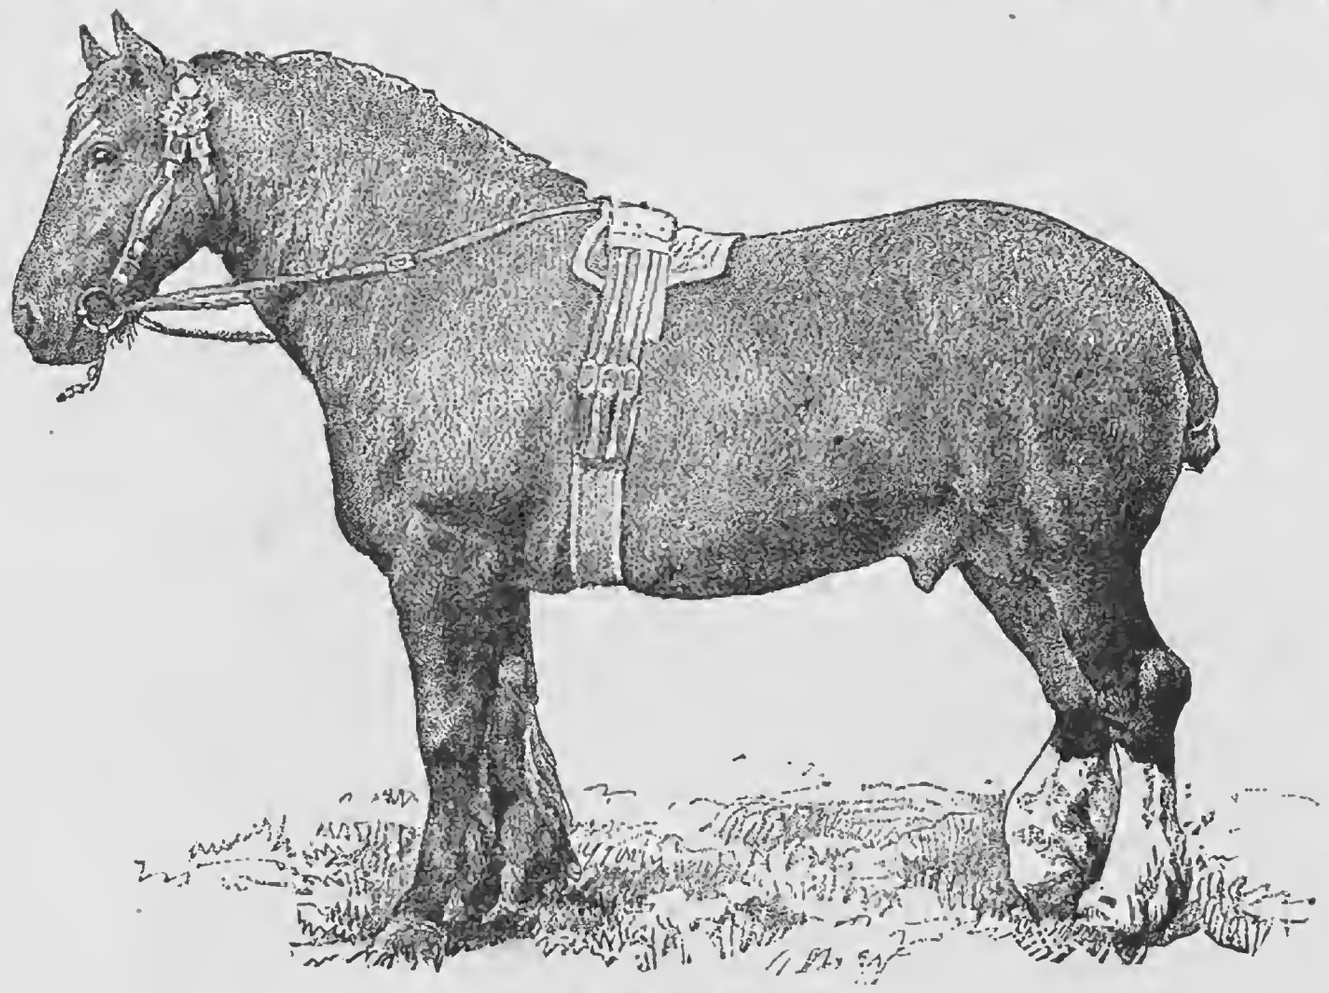
It is upon this basis that many farmers who are scarce of feed are now offering to sell at very low prices young stock pigs, rather than feed them through the Winter at present prices. Very few have corn over and above what will barely feed their stock through the Winter, and the amount of pork or beef fattened for market will be comparatively small; much below the average and will, as a rule, be marketed as early as possible. It should be borne in mind, however, that while the large number of hogs that will be thrown on the market this year on account of scarcity of feed, must lower prices, the very same cause will tend to raise the price of hogs next year by causing a scarcity of them; thus all who can keep their hogs will get good prices next year.

Miller Co., Mo. N. J. SHEPHERD.

The Horseman.

THE CLYDESDALE STALLION POINTSMAN.

FROM our English exchanges we notice that the Clydesdale horses are being largely introduced into England where their rivals in this country, the Percherons or Percheron-Normans, strange to say, have never gained a foot-hold. In the accompanying engraving we present to our readers a likeness of the Clydesdale stallion, Pointsman, winner of the second prize at the late Royal show at Derby, and bred and owned by Mr. James Whyte, of Aldborough Hall, Darlington, Durham. Of the portrait the London Agricultural Gazette, from which we have re-engraved it, says: "Barring possibly a slight disproportionate dwindling of the hind-quarter—the slighest relative diminution of dimension there—owing to the position of the animal before the lense of the photographer, this appears to us a very excellent and life-like reproduction of the animal." Either English horsemen do not bestow so much care as Americans on producing a sleek, well-curry-combed and plump appearance in their horses before posing them before the photographer's lense, or else the American artists are more inclined than their English brethren to prefer a handsome appearance to a truthful representation.



CLYDESDALE STALLION, POINTSMAN.—FIG. 494.

Implements, &c.

THE PERFECT HATCHER.

(For Illustration, see page 717.)

WE give herewith an illustration of the Perfect Hatcher, which is one of the latest improved machines for artificially hatching chickens. As old as this art is, it has never been attempted to be perfected until within the last score of years. Within that time the nature of the process of egg hatching has been very closely studied by intelligent experimenters until the art of artificially producing the chick from the egg may be said to be practically mastered; that is, machines have been so perfected and adapted to the business that with very little care, intelligent management, and a reasonable amount of watchfulness, a larger percentage of eggs can be hatched than with hens in the usual way.

In handling this machine—and still more in handling others—the beginner must bring to his work a certain amount of mechanical "gumption" and patience. To make a complete success of it he should also know a considerable about hens and their ways. In the first place, the eggs should be fresh beyond a doubt. They should go into the machine as soon as received. The machine itself should be in perfect order and kept in that condition. Constant vigilance is necessary to see that no spoilt eggs are left in the machine to destroy the purity of the air over the healthy eggs. In fact, all the instructions that arrive with the machine should be carefully and intelligently followed, and then a satisfactory issue to the undertaking may be confidently looked for.

We have seen the Perfect Hatcher in full running order, turning out the chicks by the hundred daily. We have also taken some of the chicks home and raised them to fine, healthy fowls. From what we have seen of the operation of a hatching machine, there need be no fear of a want of success in getting the chicks in fine, healthy condition from a fair proportion of the eggs put in the machine. It is our belief that, with the proper appliances, at least a third more chicks can be raised by hand than with the best method of hen service. This will, however, require the most constant and unremitting care and attention, and in order to have the great essential among the proper appliances spoken of, the temperature of the air where the chicks are kept should never fall below 75 degrees or go above 100 degrees. If these conditions can be faithfully kept there need be no fear of raising chicks in Winter as well as in Summer and in any numbers desired. The Perfect Hatcher is as nearly automatic as any machine yet invented, and we believe that in hatching it is not excelled by any machine in the market, and that in the hands of a reasonably careful person, who can command an equitable temperature to work in, it will prove a profitable success.

THE GIANT ENSILAGE CUTTER,

THIS machine is made by E. W. Ross & Co., Fulton, N. Y., who have had 25 years' ex-

perience in building cutters. Like all the work turned out by the firm, this cutter is made of the best material and in a thoroughly workman-like manner. It is of extraordinary strength, weight and capacity, and admirably adapted to fulfill the requirements of evenness of cut, great durability, enormous capacity, and ease of feeding essential in a good ensilage cutter. Apart from these advantages, the special claim is put in for it, that, while the knives of downward-cutting machines are always rapidly "dulled" and often broken by cutting down upon the gravel, stones and other grit, which are always to be found, more or less, in hay, straw, stalks and other fodder, the four spiral knives of this machine, cutting upward, escape this injury, as there is a space in front and rear of the rollers through which objectionable matter drops, being loosened by the rollers, so that fodder goes to the knives free of all grit, etc. Our agent has often seen these machines in use and assures us that in every case they were proving highly satisfactory. While the Giant Cutters Nos. 18 and 26, run by sweep power or a small agricultural engine, are designed especially for cutting ensilage, seven smaller sizes of cutters are made by the same firm for cutting other sorts of fodder. Indestructible chain carriers as well as extension tables are also furnished to order. Full descriptive circulars and price lists will be supplied on application.

Miscellaneous.

RURAL BRIEFLETS.

We have received several samples of wheat from Mr. R. Parkhurst, of Missoula Co., Montana. Of one variety he says:

"It is a wheat known here as White Aouse or Aowse which is now generally raised by our farmers. When fully developed the kernels are much larger than those of Oregon Club, specimens of which I also forward, and it yields more than any other variety we have ever tried. I have found here a head of the Club Wheat containing 120 kernels and a single stool containing 190 stalks, all from a single kernel. I also send some specimens of the Washington Oats raised here from the RURAL seed."

We do not know of any wheat by that name; but it closely resembles the "White Fountain" which we have been raising at the Rural Farm for two years, originally from Spring seed. We take it that Mr. P.'s samples are from a Spring-sown crop. These heads average nearly six inches and about 10 breasts to a side. The remarkable part of them is that each breast contains from *five* to *seven* kernels of large size. We would feel much obliged to Mr. Parkhurst if he would send us (at our expense, of course), a quart of this seed in time to sow next Fall. An illustration of White Fountain will appear in the RURAL in due time, so that our friend will have the opportunity of comparing his White Aouse with it. One panicle of his Washington Oats measures one foot and 10 inches and bears 329 spikelets; the other measures 18 inches and bears 293 spikelets. These remarkable panicles may be seen at the RURAL office.....

Our friend-indeed and quondam neighbor, the A. A., has been turning itself inside out, and making a commendable endeavor to change its thrice-told-tale aspect. Now let it affect—if it can not feel at heart—a liberal-minded course and we should hope for it a more prosperous and influential career. As an evidence of this let it first of all give credit to the RURAL NEW-YORKER for the changes which have so much improved its appearance and reading matter. Copying, you know, good A. A., is the sincerest evidence of admiration. Now, be frank—just once to see how it seems, and speak out—like a little man—your admiration.....

"OUR attention was called to the remarks on Wheats in the RURAL of a late date by a friend. And we see you are still of the opinion that "Black-bearded Centennial" and "Golden Grains" is the same wheat. We send you by to-day's express a package containing heads of "Golden Grains," new crop; please to examine the same and oblige yours truly. You will not find any Blackbeard about them. Because there is "a similarity" between the two wheats is no reason why you should jump at conclusions. One is black and the other is white, and "Golden Grains" is a *larger grain* and a different-shaped berry from the "Centennial Wheat." We trust you will do us the justice to notice the difference in the next issue of the RURAL. Respectfully, S. Y. HAINES & CO.....

In a previous communication, in reply to our letter of inquiry, Mr. Haines refused to give us any light as to the origin of "Golden Grains," but he stated that the Black-bearded Centennial and "Golden Grains" were "as different as day and night." Now he admits they are similar. The two heads sent to us by Mr. Haines bore white beards. That is no proof that the variety is not Black-bearded Centennial. At least one-quarter of the heads of our plot of the latter bore white beards. The grains of Mr. Haines's samples were compared with Black-bearded Centennial grains sent to us by Professor Blount. The shape was not precisely the same, though the difference was less than that we have observed in others of the same variety grown in widely-separated regions. Other samples of the kernels of Golden Grains could not be distinguished from those of the Black-bearded Centennial. Mr. Haines is mistaken also in saying that they are larger.....

We observed another difference, viz., that the breasts of the "Golden Grains" were closer together on Mr. Haines's samples than upon those either of our own or Prof. Blount's Centennial. But this variation often occurs even in the same field of wheat. In the "wholesale price list" sent out by Messrs. S. Y. Haines & Co. to seedsmen and dealers some remarkable statements are made. It says: "The size of the grain is ENORMOUS, fully three times as large as our best common wheat!" Inasmuch as the grain is no larger than that of Black-bearded Centennial—supposing them to be different kinds—this statement is erroneous. It also states that it is "the heaviest grain" to the bushel. This is also erroneous, since it weighs but 62 pounds. It also states that "Golden Grains makes the finest flour in the world!" This is absurd. It is a *soft* wheat and deficient in gluten. How have S. Y. Haines & Co. ascertained that "it makes the best flour in the world?".....

Messrs. Haines & Co. sell this "Wonderful Golden Grains" or "Palestine Mammoth Wheat" the present season to *seedsmen* at "40 cents per pound, net." If it is *not* Black-bearded Centennial and is all that the firm claim for it, they have a right to fix their own price and give it the name of "Golden Grains," provided it had no name. But in so far as we are enabled to judge from careful observation and inquiry, this Golden Grains is Black-bearded Centennial; for which reason we have endeavored to guard our readers against imposition. Should it appear that the RURAL is mistaken in these views, we shall hasten to make it known. That, however, the similarity between the two grains is *very* close there can be no doubt whatever.....

A FEW days after writing the above, we selected from our own crop of Black-bearded Centennsal two heads bearing white beards. The beards of one head were pulled off and the two heads forwarded to Messrs. S. Y Haines & Co. with the following note of inquiry:

"We send you two heads. Which is Black-bearded Centennial—which Golden Grains, if either?"

The following, received the 12th inst., is the reply:

"We are somewhat puzzled over the heads of wheat sent us to examine. The shape of the grain is like Golden Grains, but if you will compare the heads with what we sent you, you will find a difference between them. The mesh is not the same, neither is the grain as good; probably this is a poor sample head you sent. We would like to know about the two wheats, or if they are one and the same thing—because we introduced our wheat three years ago. This makes the fourth season. We procured seed from the Willimette Valley, Oregon, and from a reliable party. The first we have heard about Centennial or Black-bearded Wheat has been the past two seasons. Please to give us what data, etc. you have, and let's trace up the history of each. The heads you sent are the first thing we have seen approaching ours; but we would like a little more information on the subject.

S. Y. HAINES & Co."

We have only to add that we have not succeeded in our endeavors to trace the history of Black-bearded Centennial and would be glad to receive any information in the matter. Messrs. Haines & Co. seem no longer to press their statement that the two kinds are as different "as day is from night" and we are glad they are now willing that we should know as much about it as they.....

GIANT ENSILAGE CUTTER.—FIG. 496.

What Others Say.

INDIAN CORN.—Prof. Beal begins a lecture on Indian Corn by stating that he knows very little about it. Then he goes on to prove to the audience that he knows a good deal about it—from which we have a right to conclude that Prof. Beal knows very little about what he does know. We make a few brief extracts:

Indian corn is the most beautiful crop raised on the farm, whether we consider the grain as shelled and ready to feed or to market, the white or golden ears as they fill the farmer's crib, or the majestic sub-tropical stalks as they grow in their leafy luxuriance during the heat of Summer. From the blade to the full corn in the ear it is full of mystery, beauty, and promise. In the words of C. A. Green, "The corn-field is grand to look upon in its glory in August. It resembles an army of tasseled knights, decorated gracefully with ribbons, each member of which sports a silk pocket handkerchief." * * * * The plants of the grass family are of more value to man and his domestic animals than all other plants combined. Of all the cereals, wheat is the most valuable for food, rice feeds the most people, while on account of the ease with which it can be raised Indian corn supplies the greatest number of wants. Our kinds of corn are very numerous and variable, but they are, most likely, all derived from one species.

* * * * The tallest full-grown stalk of corn which I have seen grown in Michigan was fourteen-and-a-half feet high. The seed came from Missouri and was planted in 1880 by William Gladden, of Lansing. Mr. C. L. Flint, Secretary of the Board of Agriculture in Massachusetts, says that a stalk in Eastern Tennessee measured twenty-two feet and three inches in length. One at the Centennial Exposition, from Kansas, was said to be seventeen feet high. * * * * The largest ear in the museum of the Agricultural College has eleven-and-a-half inches of corn, is three inches in diameter at the base, two-and-a-half inches near the middle, two-and-one-fourth inches near the top. There are twenty rows of corn, with about sixty kernels in each row The ear was raised on Long Island on the Experimental Farm of the RURAL NEW-YORKER, and is a yellow dent, known as the Chester County, Pa., Mammoth. * * * * From the point of view of chemical composition there are, broadly speaking, two kinds of Indian corn, the common and the sweet. The greater richness of sweet corn in albumenoids and fat is very decided, and indicates a higher nutritive value than that of common corn. Sweet corn in all the analyses contains more ash, more fat, and less carbo-hydrates than common corn. Flint and dent corns have, in the gross average, practically the same composition, as will be seen from the comparison of 31 flints and 19 dents. Western corn has also, in the gross average, about the same nutritive value as Eastern corn. The ripe grain as a crop contains absolutely more of every ingredient than the unripe. * * * * The extremes of time required for growing corn to maturity, so far as I know, are 70 and 200 days. The small yellow pop corn, which grows from two to two-and-a-half feet high, often ripens in 20 days, and perhaps less, while in the Southern States corn often requires 200 days for growth and maturing. Climate has a wonderful effect on corn. Prof. Shelton, of Kansas Agricultural College, sends corn to the Michigan Agricultural College which has been raised there for three years. It went to Kansas as King Phillip, it comes back well marked with dent. He says it is the effect of the climate and is not due to crossing with dent corn. * * * * * Every one undertaking to improve corn should study the best that has been written on the subject, have his ideal of perfection, and then strive to reach it. In some one or more departments of agriculture every farmer should strive to excel. The improvement of some variety of corn has scarcely begun to attract the attention which its importance demands. Some results are quickly reached and the subject grows in interest with study. * * * The construction of silos in which to keep ensilage till needed for Winter use is receiving much attention, and we shall very likely soon know whether or not it is a profitable way to keep fodder. If we only wait a little, the book farmers or fancy farmers too often sneered at will soon solve this important question without any expense to the practical farmer who does not believe in wasting time and labor on experiments.

FIGS IN MAINE.—Our bright young contemporary, The Home Farm, of Augusta, Maine, says that figs grown in Maine were among the curiosities shown at the recent exhibition of the State Pomological Society. They were grown by Mr. F. O. Frost of Monmouth, who called them Brown Turkey Figs. They were grown on trees set in the garden, the trees being given the same care that one would give apple or pear trees. They yield two crops a year; and Mr. Frost showed specimens of both crops—one fully ripe and one about a quarter grown. The trees are taken up in the Fall and the dirt shaken off, when they are placed in the cellar and receive no care till again set in the ground in Spring.

MR. C. M. Hovey, writing of the maples in the Mass. Ploughman, cannot omit the mention of one called Wier's Cut-leaved, an accidental variety of the White Maple, found by Mr. Weir of Illinois, among his seedlings. It has a slender, drooping habit, and the leaves

are most delicately and finely cut or divided. It is a very ornamental tree for lawns or flower grounds.

ALL ye who are thinking of seeking a new home, listen to this good piece of advice from Henry Stewart. We fully indorse what he says:—No person who intends to change his locality and mode of life should fix himself at the start in any strange locality. He should accept no statements of strangers or persons interested in inducing him to purchase property. He should, on the other hand, act with deliberation and common sense, and be in no hurry. There is a satisfactory place for every man somewhere; but it is hardly possible that he can strike it at the first effort, and it is best to spend a month or two in traveling and exploring, and then to settle down temporarily in the place chosen until the first impression is either justified or corrected.

THE editor of the American Rural Home says that the man who through indolence or inefficiency fails to properly till and fertilize his soil has no right to ask God's blessing on his labors, for he has neglected to co-operate with Him in the appointed way through which such blessings come . . . . . To judge of the condition of an apple tree is like judging of the condition of sheep in a pasture, says Prof. Beal. Look at the sheep and not at the pasture, and if they are plump and fat they are all right . . . . . From the versatile pen of the late Mrs. Mary Locke—a regular contributor to the Pacific Rural Press—we take the following paragraphs: "If you have a grand, noble farm, try to feel like a king and treat your wife like a queen. . . . . To plant homes worthily woman's toil and care were also needed, and hallowed be their memory. * * When we have found our leisure, we must do something with it or it will "sour" on our hands. . . . . Yes, hard knocks pay if they give us self-reliance and fortitude; if they broaden instead of hardening our sympathies; if they knock out of us arrogance and self-conceit, instead of putting more in." . . . . . I want to see farmers look better than they do—dress better, carry themselves with as much easy grace and confidence as though they felt in every muscle that handling the plow, the shovel and the hoe is just as dignified and gentlemanly as measuring dry goods, dealing physic, reading law or managing "rings.'" . . . . . There is some reason for thinking that after all has been "said and done" no crop pays the British farmer better than wheat, says the London Agricultural Gazette.

Everywhere.

RURAL SPECIAL REPORTS.

Dakota.

BATTLE RIVER, Custer Co., Oct. 3.—The original White Elephant weighed four ounces; its youngsters weighed 44 pounds—a light yield for this region. W. N. W.

Illinois.

CHAMPAIGN, Champaign Co., Oct. 1.—It has been raining moderately in this county and neighborhood for the past 24 hours, and nearly two inches of rain have fallen. Presumably the same is true for the greater part of the State, since the storm which moved east out of the valley of the Missouri, Thursday, had two or three hundred miles of north and south diameter. This breaks partially, if not wholly, the drought of 1881, so far as Illinois is concerned, and in that light may be regarded as a special providence, for the water famine will be put an end to, grass will come to something before cold weather, in pasture and in meadows, the earth will be so softened that the hardest and most refractory soils can be broken up and sown to wheat, and, last of all and most important of all, the wheat land plowed and sown in the dry weather will be in a measure compacted so as to stand a hard Winter should it come. Besides the stock men and farmers, the railroads have been put to great cost and inconvenience to obtain water, in some cases on north and south lines engines having to make sixty and seventy miles between water stations. The water is running in the sloughs for the first time in three months, and there are surface accumulations of it on hard-pan soils, which will last for some time. Prices are still on the rise, the two leading cereals having reached the highest figures for the year yesterday. Winter wheat, $1.45@1.50; Spring, $1.35@1.40; cash corn 73 cents, and May corn 78 cents, with almost every leading agricultural product in sympathy. And these prices are regarded as legitimate and not speculative by those who have the best means for information. But the pinch on the corn and hog crop will not be felt for at least eight months, and then what the markets will be nobody pretends to know. One of the surprises of the times and season is the display of the magnitude of the power which keeps the price of cotton down, in the face and eyes of the fact that the crop has been reduced at least 30 per cent. Pork is now $20.00 a barrel, corn meal two cents a pound, and corn $1.25 a bushel in the South, with the almost sure prospect of an advance of 25@50 per cent. before the next crop is made. It is easy to see the cotton growers will be in a bad way, indeed, if there is not to be from 33 to 50 per cent. advance in the crop they produce. Contrary to general expectation there will be considerably more acreage sown to wheat and rye this year than last, and I suppose the acreage would be nearly doubled if seed could be had on credit by those who, though responsible, cannot pay money down for seed. B. F. J.

DE PUE, Bureau Co., Oct. 5.—Corn is about two-thirds of a crop. It has been selling at 70c. per bushel, but dropped yesterday to 65c. The White Elephant was planted May 10, cut into 10 pieces, one in a hill; eight grew, and yielded 105 tubers weighing 18 pounds when dug, Oct. 1. The R. B. Sorghum was planted in May; the last of July I cut it one foot from the ground when about four feet high. Now it is three feet high. I left some for seed, and on Oct. 1, I noticed it had tasseled out, but I am afraid it won't mature. The W. Oats are pretty nearly all smut; but I've got two quarts of seed. The asparagus didn't do well, but the pinks are beauties. F. P. R.

STILLMAN VALLEY, Ogle Co., Oct. 4.—The small White Elephant Potato was cut into 13 pieces with an eye in each, and each eye had a hill of its own three feet apart. They were hoed three times and 12 grew. They were dug Sept. 15 and yielded 56½ pounds of fine tubers. One of them weighed a pound and 14 ounces—the finest lot of potatoes ever raised in this county, and I can prove it. The oats, flower seeds and sorghum all did well, but the asparagus never grew. I. A.

Indiana.

PITTSBURG, Carroll Co., Oct. 3.—I cut my Rural Branching Sorghum on Sept. 20. It averaged seven feet in hight. Only 42 grains grew. It was transplanted into rows 3½ feet each way, one plant in each hill. I cut 399 stalks with leaves from the bottom to the top; would have cut sooner but for the extreme drought. No signs of seeding; left two of the longest stalks to see what they will do. Think we will have to plant a little from hot-beds in the Spring to get seed. I am convinced that it is the best fodder plant in America. The White Elephant comes to the front with 141 pounds of small potatoes. Potatoes in this part of the country are a complete failure. We had one-third of a crop of wheat; corn is three-fourths of a crop. I tried the RURAL'S method of cultivation with one 12-acre lot of corn, harrowed it just as it showed above ground; afterwards plowed with a common walking cultivator four times. At no time did I plow over three inches deep, and to-day it is the best field of corn in my neighborhood. N. B. B.

LA GRANGE, La Grange Co., Oct. 3.—From two ounces of W. E. Potato seed I dug 59 pounds of splendid tubers. We cooked some and pronounce them good. R. B. Sorghum made a wonderful growth, but I think it cannot compete with corn here. Asparagus doing splendidly. Oats blasted badly. We had good success with all the other seeds and plants. Farmers have had rather indifferent success this season. Our corn will average a fair crop; potatoes one-fourth of a crop. All vegetables scarce. The outlook for the young wheat is good—fine growing weather. Prices of produce are: Wheat, $1.25; corn, 70c.; oats, 30c.; potatoes, $1; pork, on foot, 5@6c. per pound; butter 20c.; eggs, 16c. N. S.

Iowa.

DAKOTA, Humboldt Co., Oct. 3.—I have 48 asparagus plants. The W. Elephant I planted in 17 hills—an eye in each. Twelve of'em yielded 16 pounds. Those from the four other hills I didn't weigh. The W. Oats and R. B. Sorghum were failures, except two hills of the latter one of which had 13 stalks, the other three. The flower seeds came up well but a heavy rain washed them all out, so that we did not have any left. Crops are poor, with the exception of corn which is above the average of other years. We had a snow storm on September 16, but no frost till September 29, and that was light and did not injure anything. G. L. H.

WELLMAN, Washington Co., Oct. 5.—The White Elephant Potato we received had 10 eyes, of which nine grew, producing 101 tubers, 35 large and 66 medium to small. The Branching Sorghum and Washington Oats did not do well on account of wet weather in June. Of the asparagus every seed seemed to grow. The plants stand from eight to 10 inches high. We have five carnations. The picotees are just splendid—26 different kinds. Mother takes all our visitors to see them, and they are praised by all. We have 26 Cuthbert Raspberries from the one you sent out a year ago. E. B. S.

Kansas.

DOWNS, Osborne Co., Oct. 6.—The RURAL seeds were almost a failures owing to the drought. The White Elephants were very well at first, but the bugs and drought injured them severely. I have a couple of quarts of seed for next Spring. From the Washington Oats I only got the seed back. The asparagus grew well for a time, but the dry weather "was too much" for it. The R. B. Sorghum grew five feet high but did not seed. The pinks turned out poorly. Dry weather began the last of June and has lasted ever since, with the exception of one rainfall early in September. Wheat, however, is about 15 bushels per acre; but corn was burnt up by the hot winds, so that there is hardly any. Potatoes scarce and rotting. The young wheat is being eaten up by chinch bugs. No fruit. The look-out for the coming Winter is dark enough here. Wheat sells for $1.10; corn, 55c.; potatoes, $1.25 and hard to get. We like the RURAL so very much that we don't know how we lived so long without it. J. B.

PARSONS, Labette Co., Oct., 4.—The dry spell is broken. Virtually it has lasted three years. On the 24th of September it rained half an inch; on the 28th, one inch; 29th, two inches; and on the 30th there was more rain rushing down the runs than I had ever seen. No such serious drought as we have seen the past eight weeks, had ever occurred here. Nearly all the work on many farms was in hauling water and digging wells. About half the usual area of Winter wheat is in and up, and farmers have been busy plowing up to this time. Grass and wheat and turnips are growing finely. We see now very plainly the results of a *season's* toil on the farm. Vegetables (except early Spring) are entire failures. Fruit was almost a complete failure. Oats a fair crop. Wheat on acreage planted, three to five bushels. Corn—our chief crop—is pitiful, and may be put thus: Out of 10 parts of its acreage, two were no bushels to the acre; three, four; two, ten; two, twelve; one, twenty; giving an average for the crop of this county of seven-and-six-tenths bushels to the acre. This will be very nearly the average corn product of the State, except on about an area equal to 20 square miles in Central Southern Kansas, which will average 40 bushels to the acre. The consequences will be quite hard on small farmers. Had there been one-third or one-half a crop the present prices would have made the crop as profitable as a full crop of former seasons. But seven-tenths will have none to sell. Grass was (and is) a good crop. Prices are: wheat, 95c. to $1.35 per bushel; corn, 40 to 65c; oats, 45c; potatoes, $1.50 per bushel; castor beans $1.75 per bushel; flax seed $1 per pound: flour, $4.50 per 100 pounds; coal, 13c. per bushel; lumber, $22.50 per 1000; brick, $7.50 per 1000. Castor beans and cotton are but one-third to one-half of an average crop. J. B.

Kentucky.

GARRETTSBURG, Christian Co., Oct. 4.—This it the largest tobacco-growing county in the State, and also among the first in wheat production and corn raising. Tobacco will make three-fifths of a crop if frost does not come before October 15. German Amber, Fultz, Golden Chaff and Georgia Rust-proof wheats are the favorites hereabouts. W.E.M.

Maine.

NORTH PARIS, Oxford Co., Oct. 4.—I planted the small Beauty of Hebron and raised a quarter of a bushel of tubers. The next year I raised nine bushels, and after selling enough, at 50 cents a peck, to pay the subscription price of the RURAL for two years, I planted the remainder, and have harvested this Fall 275 bushels of very nice potatoes. I carried some to the Oxford County Agricultural Fair last week and took the first premium for the best specimens of potatoes on exhibition. I have engaged quite a number of bushels for planting at one dollar a bushel, and think I can dispose of nearly all I have to spare at that price. I think it pays to take the RURAL NEW-YORKER, and you can reckon me among your life subscribers. W. W. D.

Massachusetts.

SPRINGFIELD, Hampden Co., Oct. 3.—The White Elephant Potato weighed four ounces: it was cut to eight eyes and planted one piece in a hill—soil a sandy loam. One shovelful of manure was used in each hill. Product, 27 pounds of fine-looking tubers. Corn has been a fair crop, although it was backward during the first half of the Summer owing to cool weather. Potatoes are a light crop in most cases, the bugs having done considerable injury in some fields and dry weather injuring those planted late. O. L. H.

Michigan.

CORUNNA, Shiawassee Co., Oct. 5.—My R. B. Sorghum is doing well; most of the seed came up, and it is coming to seed now. I cut several hills and they are growing fast. My W. E. Potatoes did not do very well owing to the drought. They were dug about the 1st of September and yielded about five pounds of nice white tubers. The Washington Oats did very well. The asparagus seed came up finely; I think I have about 125 plants of both kinds. Of the carnations and picotees about five plants came up and some of them have blossomed. H. W.

DETROIT, Wayne Co., Oct. 4.—The W. E. Potato was cut into 13 pieces; 12 of them grew and produced about six pounds of tubers, a very small yield, but I shall save all for another year's trial. The W. Oats did well. I harvested eight pounds of clean seed from the sample received. The stalks stood about four feet high and the grain was very smutty. The R. B. Sorghum I planted on June 11 on a piece of land which was cultivated three times before planting, leaving but very little weeding to be done afterwards. At the same time I planted near-by some Pearl Millet seed which I had left over. Both of the seeds came up well, but the Pearl Millet out-grew the R. B. S. On August 13 I selected some average hills of both and cut the plants about six inches above ground—they were all four feet high; six hills of R. B. S., in which there were 40 stalks, weighed six pounds, while two hills of Pearl Millet, 48 stalks, weighed four pounds. This shows a better yield for the millet in the first growth; but the second growth is in favor of the Sorghum; for on Oct. 4, the same hills were cut again; the stalks were three feet high and weighed 6½ pounds for the sorghum, and four for the millet. F. P

Minnesota.

ANOKA, Anoka Co., Oct. 5.—From my very small White Elephant I made eight hills with one eye in a hill, and got half a bushel of nice tubers. The R. B. Sorghum I planted on May 18 in a row four rods long. It grew to a hight of eight feet, and the heads were from six to eight inches long and the seeds got pretty ripe, though the stalks are green yet clear down to the ground. The land had some barnyard dressing and nothing else. I think I have seed enough for from 10 to 15 acres. B. H. C.

CAROLINE, Le Sueur Co., Sept. 30.—The W. E. Potato was cut in single eyes, planted in drills, three feet apart, eighteen inches in a drill and yielded 74 pounds. Several weighed 1½ pound apiece. How is that for Minnesota "big woods?" Mold's Ennobled Oats yielded heavily but lodged badly. The W. Oats stood well but were damaged somewhat by smut. The asparagus is doing finely. The carnations and dianthus are beauties. G. V. MCG.

LAKE CRYSTAL, Blue Earth Co., Oct. 6.—The White Elephant weighed two ounces and had 10 eyes. I planted it about May 15th, one eye in the hill, in common garden soil; no manure for two years; no more care than my other potatoes. The bugs did not hurt them any. I dug them Sept. 5; one hill weighed 8½ pounds; the ten hills weighed 56½ pounds. There were 200 tubers, nine-tenths of which were good eatable potatoes. We have had a poor season for potatoes—too much rain. It has rained here as often as every three days (except for about three weeks in harvest) for the past six months. There is no thrashing and not much plowing is done. The water was never known to be so high. The oldest inhabitants are drowned out, so we have lost past records; but what are alive never saw it so high. The R. B. Sorghum is about 10 feet high, and is not topped out. It would not ripen here, so it would not pay to plant it. The pinks were nothing but common single pinks, with the exceptions of two, and they were small. M. M.

Missouri.

CALDWELL, Oct. 3.—Of several kinds of grass and clover I sowed last Spring the only kind that lived through the drought was an experimental patch of Alfalfa. It came out as sound as a dollar. Red Clover, common and mammoth, Timothy, Orchard Grass and Red-top all perished. Much of the old pastures and meadows perished, Red-top being about the only grass that remained unhurt. The White Elephant made 17 pieces, which were drilled in a row about 18 inches apart as early in April as the ground would permit. At the same time I planted Early Rose in rows on either side. The Elephant made a beautiful growth, much like the Early Rose, except that the leaf was a little larger. It ripened about a peck of very fair tubers about the same time as the Early Rose—the first week in September. A few tubers have rotted since digging, and so have some of the Early Rose. The Washington Oats promised well, but were destroyed by a horse getting loose and eating them. The Branching Sorghum was planted about May 20, came up quickly and well, but, I suppose owing to drought, never headed. So far as my taste goes, I can find no more sweet about it than in a stalk of broom-corn. I turned the cattle on it on the 1st of September, and for several days they did not touch it, and when they did, they ate it to within three feet of the ground and then left it; while last year I turned them on a piece of Amber-cane sown broadcast and they ate it to the ground. The cow-peas were greatly mixed as to color, but came up well and yielded finely. Both varieties of asparagus came up sparingly, but

started off well until they were checked by drought. J. L. E.

Nebraska.

PLUM VALLEY, Knox Co., Oct. 4.—The R. B. Sorghum was planted on the last day of May on ground never plowed before; no manure. It came up well and stands to-day green with 12 to 20 stalks in a hill and 10 feet high. I have gathered some heads the seed of which I think will grow. The W. Oats the grasshoppers harvested. The asparagus seeds came up fairly; the plants stand 12 inches. The flower seeds were planted on new ground and they have done poorly. J. P.

New Jersey.

SCHRAALENBURGH, Bergon Co., Oct., 3.—There has been no rain to wet the ground half an inch from July 30, to September 28. The Washington Oats were sown in my garden in early Spring. They made a good stand; none of them lodged; but they grew a large quantity of smut. The asparagus seeds were also planted in the garden. They look exceedingly well, considering the great drought during the Summer. The small White Elephant Potato, having 11 eyes, was cut into as many pieces and planted in sandy loam. All sprouted; the grub cut one plant twice, when it died. A mole burrowed under another and eat off the stem, leaving nine. On Sept. 29, I dug 64 tubers, mostly of a good size, weighing 16 pounds, which I consider good, taking into account the great drought. The flower seeds have all died for want of rain. Sorghum not planted. C. A. C.

[The above report comes from near the Rural Grounds. Eds.]

New York.

FORT ANN, Washington Co., Oct. 1.—From the two small White Elephants I made 13 hills. Upon digging them I found the grubs had made bad work with them; but I secured 36¾ pounds. One weighed 1¾ pounds, another 1½ pound. The season has been very dry and the potato crop is very light. F. A. B.

GALWAY, Saratoga Co., Oct. 7.—The White Elephant weighed three ounces, and was planted in three hills, from which I harvested 38 large, full-grown Elephants. The R. B. Sorghum is now 6¼ feet high and the seeds will mature soon. The W. Oats I sowed on a light loamy soil without any fertilizer. They turned out well; from one kernel alone there were 22 stalks measuring 5¼ feet, with heads 17½ inches long. J. K. M.

GOOD GROUND, Suffolk Co., Oct. 8.—My White Elephant Potato weighed four ounces. I planted it 15th of April in eight hills and dug, on Sept. 15, 32 pounds of fine Elephants besides a few baby Elephants. Shall cook a few and if they are as good as they look I shall keep the rest for seed. The Washington Oats did well. I planted the sorghum in three drills or rows, and about the middle of August I cut one row, but it kept right on growing, and is now up about five feet high. The other two rows are full of seed heads about nine feet high, but a few nights ago the frost killed the leaves. Some of the heads are out of blossom and some are not. Do you think I shall loose the seed? I should be sorry to loso it, for it is just what I want. [We have several times expressed our belief that the seeds will seldom, if ever, mature so far North unless the plants intended to mature them are raised in cold-frames or pots so as to have an earlier start than the ordinary field crop.—EDS.] The asparagus did not come up very well; but the pinks are splendid. It is so dry here that late cabbages and turnips are a total failure. J. E. R.

North Carolina.

ASHEVILLE, Buncombe Co., Oct. 5.—The crops of Western North Carolina are very unsatisfactory. Tobacco can't be more than two-thirds of a crop. Corn is lighter than it has been for several years. Wheat is almost a failure, and oats but little better. Vegetables of all kinds are short and inferior. Peaches were plentiful, but of poor quality, and apples about the same. Yet I think with even this poor outlook that most persons will have ample sustenance. In fact, this has been a coun- of such plenty that with a little economy we will steer through all right. S. C. S.

Ohio.

DAMASCOVILLE, Columbiana Co., Oct. 3.—The Cuthbert Raspberries proved perfectly hardy here. Quality of fruit very good. The Beauty of Hebron potatoes, notwithstanding severe drought, averaged large and smooth—much more prolific, and I think better in quality, than the Early Rose. The White Elephant weighed two ounces. It was cut into as many pieces as eyes (18 or 20), and planted one in a hill, 16 to 18 inches apart. It yielded 34 pounds. The largest weighed 1¼ pound; the six largest, six pounds. Very few small ones. The asparagus seed came up well; grew slowly in consequence of drought, yet will make good roots. The R. B. Sorghum came up finely. One seed made 15 stalks; many others from five to ten. Till within a few weeks it made so little growth, that I did not cut it off. Since rain it is growing very fast, and I hope a few seed will ripen. The Southern cow peas I think will prove valuable, especially to enrich poor land. None of the above were grown on extra rich soil, or had any other fertilizer than stable manure. My daughter has grown from the RURAL seeds some flowers which we prize very highly. I have named only a part of the kinds that I consider valuable. The seeds I regard as of more value than many times the subscription to the RURAL. E. W.

LUCAS, Richland Co., Oct. 2.—I planted the White Elephant, cut to single eyes, on May 12, and dug 53 large tubers on August 6. Potatoes in this county are scarce. Farmers are mostly through seeding. Wheat is worth $1.40; corn, 70c.; oats, 40c. W. D.

RAVENNA, Portage Co., Oct. 6.—Have dug White Elephant Potatoes to-day. One medium-sized potato was cut into 15 pieces, with a single eye in each, planted in 15 hills, and all grew and yielded 19 pounds of good-sized, fine-looking tubers. With Beauty of Hebron for an early variety, Snowflake for a medium one, and the White Elephant as a late variety I am satisfied. I do not regard the Washington Oats as a success. Have a bed of asparagus started from seed of Giant Dutch and Argenteuil. R. E.

Pennsylvania.

MEADVILLE, Crawford Co., Oct. 2.—To-day we have had the first good rain we have had since Spring. From the White Elephant Potato I got 11 pounds of nice tubers. My Washington Oats I sowed on rather wet ground; the berry was good, but th Rural Branching Sorghum did not do well. The asparagus, celery and carnation are very nice. The Judas Tree is six inches high. W. S. S.

Vermont.

TROY, Orleans Co., Oct. 5.—September was our warmest month this year. Yesterday about noon it began to grow cold, and now we have a regular Texas norther in Vermont. Apples are all frozen on the trees. Potatoes are not half dug, and will not be half a crop. They are worth 60 cents per bushel to ship. I hear complaints of their rotting badly. Other crops are fair. September made a good corn crop in this part of the State. I hear it is selling for $1 per bushel, while Western corn brings 85 cents and oats 40 cents. The hay crop was heavy except in a few places where Spring frosts killed the grass. We have had what one might call a wet-dry Summer—it has rained a great deal of the time, but there have been no heavy rainfalls, so that the streams have been very low and mill-men are complaining of a scarcity of water. The cloudy weather has probably injured the potatoes, but fruit trees have grown splendidly. A. C. D.

Wisconsin.

ELROY, Juneau Co., Oct. 2.—The RURAL seeds sent to me have given great satisfaction and no little pleasure. The R. B. Sorghum I drilled through my fingers in three rows about 60 feet long; then raked it in with a hand hay rake. I have a very good stand. When about five feet high I began to cut it, leaving an occasional stalk for seed. The second growth is now over four feet high. I have cut some of it, and the third crop has started to grow. Stock, horses and colts eat it with evident relish. I consider it a good fodder plant. The Washington Oats I sowed broadcast and from the few received I have got 6¼ pounds of grain, and 9¼ pounds of straw. From the small W. E. Potato I have dug 60 pounds; the largest is ten inches long and weighs two pounds one ounce; the others go from about half a pound to 1½ pound. The asparagus and flower seeds have done equally well. My wife has plenty of flowers, and some fine ones, but none of the kinds that come from those seeds. It has been quite a pleasure to show them to friends and neighbors who call occasionally and also to speak a few words for the RURAL. None of the seeds received any special care and no extra work. They grow on land that has been under cultivation for over 20 years. Considering the late Spring we had here, I think the RURAL seeds have done remarkably well. E. R.

NEW CASSEL, Fond du Lac Co., Oct. 3.—From the White Elephant I had 12 hills planted about May 1, and these yielded 34 pounds of good-sized tubers. The R. B. Sorghum didn't do well owing to a cold, backward Spring. From the Washington Oats I got 11 pounds. Wheat is about half a crop. Oats and barley good crops. Corn about half an average yield. Wheat sells for $1.34; barley, 90c.; oats, 30c.; corn, 50c.; potatoes, 90c. Winter wheat is looking well. J. O. N.

REEDSBURG, Sauk Co., Oct. 4.—I cut the White Elephant into 11 pieces and planted one piece in a hill, and from the 11 hills I had 62 pounds of nice tubers, some of them very large. The Rural Branching Sorghum did very well; some of it was over nine feet high; but it was too late to ripen seed. The pinks were beautiful. E. H.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

SAWDUST AS MANURE, ETC.

W. L. S., Namozine, Va., says:—"I have 300 or 400 loads of sawdust where there was an old mill seat, can I make it available as manure by composting it? 2, What is the best work on artificial manures or on composting? or, where can I get a circular treating on these subjects?"

ANS.—1. If Mr. S. had mentioned the kind of wood out of which the sawdust was made, and the kind of land he proposes to use it upon, we could then give a more definite reply. Old sawdust from such woods as oak, hickory, maple, beech, birch, basswood, white wood, elm and many other kinds of wood, contains so much potash and lime besides a little phosphoric acid, that it has some value as manure: but pine, hemlock, poplar, spruce and other soft wood sawdust has very little manurial value. Yet the latter has an excellent mechanical effect mixed with a stiff clay soil, rendering it more porous, and thus admitting a freer circulation of air and deeper penetration of rootlets, and thus resulting in larger crops. A little coating or mulch of this poor sawdust will also protect Winter wheat or other Winter grain from heaving out with frost. It is also an excellent absorbent, and thus valuable for bedding stock and absorbing the liquids, and therefore it may profitably be composted with stable manure. It will assist in preserving the valuable constituents of the manure, but has very little manurial value of itself. This is the best general use that can be made of sawdust. 2. Dana's Muck Manual, $1.25, though inaccurate in many respects, Bonner's Method of Making Manures, 25c., and Bruckner's American Manures, $1.50, will give information on composting; and Ville's School of Manures, $1.25, will give a good idea of chemical fertilizers. Any one of them can be got through the American News Co., New York.

WINTERING ROSES OUT-OF-DOORS.

M. W.-F., Bryn Mawr, Pa., says:—"Will certain roses—Safrano, Isabella Sprunt, Enfant de Lyon, M'd'lle Austine, Bon Silene, and Laurette—live out-of-doors, with moderate protection, in this climate (Philadelphia)? I have very nice and thrifty rose plants of these varieties, that are still blooming. If I lift them and take them in the house for wintering, they will *surely* die; so what had I better do in order to save their precious lives?"

ANS.—All the roses you name will live out-of-doors with slight protection in your locality. We have so grown them for many years. The best covering consists of leaves. If these are not at hand, long litter from the stable will answer the purpose. If the shoots, or a part of them, can be pegged down, it is better to do so, as the parts exposed (especially the late, unripe growth) are likely to be killed if the Winter should prove to be severe. If the shoots are not pegged down, the leaves or litter should be heaped up about the plants in a conical form, and some brush or sticks placed on them to keep them from blowing away. Do not cover the plants too thick, especially with manure litter, but give enough for protection; and it is important that the covering be not applied till the ground has become slightly frozen. Uncover early in the Spring. If the tops of some should be killed, the crowns will send out vigorous shoots. A very successful rose amateur near New York wraps his Tea Roses in hardware paper, with a little litter at the base, and seldom loses a plant.

PLANTING GLADIOLI.

E. B. S., Wellman, Iowa, asks how to plant gladioli bulbs; he has failed in three attempts.

ANS.—Select good, rich soil, or make it so by manuring. Dig trenches 18 inches deep and, any time in May, plant the bulbs about a foot apart and cover with two-and-a-half inches of soil. When the plant is growing do not trim it unless the leaves have turned brown. Any injury to the leaves is an injury to the bulb, though cutting the flowers will add to the nourishment of the bulb. Take up the bulbs for the Winter about November 1st, and after they are dry place them in paper bags. If the gladiolus is to be propagated from seed, it should be sown in pots or boxes as soon as it is mature and put in a greenhouse, or it may be sown in March or April in a hot-bed with moderate heat. Cover the seeds lightly. Shade the young plants from the sun. Re-pot and put in the ground in June. In the Fall take up the pots and put them in a warm, dry place, leaving earth upon the roots. Plant out in May. They should flower the third year.

Miscellaneous.

J. A. R., Wadena, Ia., sends specimens of two varieties of apples. Of one he says it is a seedling of a tree bought of a Rochester, N. Y., nursery some 20 years ago; that last year it yielded three barrels of fruit which kept until April in prime condition as there were not a dozen speckled apples among them all, and he inquires whether it is a seedling. Of the other specimen he says it is from a sprout of the Tetofsky and closely resembles the Russian apples. The tree grows tall and straight with very few branches. The specimen sent is one of 23 that grew on less than two feet of a branch, making a solid mass, and our inquirer asks whether it is possible that it should be a hybrid, as the tree closely resembles the Tetofsky in shape and color while the fruit is entirely different.

ANS.—We sent the specimens to our friend, Mr Charles Downing, for his opinion, and he writes: "The apples were received in good condition. J. A. R. first says the green apple is a seedling; then afterward he says: 'I send it to you to ascertain if it is a seedling, etc.' From his own account it is very uncertain whether it is a seedling or not, and until that point is settled it is hardly worth while to introduce it. The other apple which he also says is a seedling and which is now ripe, is a pleasant apple but not equal in quality to many of our best apples of its season, and it is not good policy to introduce any that is not equal to those we now have. Of course, this is only a single specimen and imperfect, and may not be characteristic of the variety; there may also be something as to the tree's growth, bearing, etc., which may make it valuable for that locality." With regard to the likelihood of the second apple being a hybrid, all we can say, with our present scanty knowledge of the conditions of its growth, etc., is that the blossoms of apples may cross through the agency of wind or insects. Plants raised from seeds of such crosses would in most cases show the cross.

H. K., Copper Hill, N. J., asks whether it would be advisable to sow wheat in this dry weather with 400 pounds of superphosphate to the acre.

ANS.—The wheat should be sown now, if at all this Fall. With regard to the use of superphosphate in dry weather, it must be remembered that no sort of manure can be of much use as plant food unless there is sufficient moisture to dissolve it, as plants can only absorb food in solution. If we are to have any rain in this section this Fall, we must have it in time to render the superphosphate available as plant food, and the fact that the seed is sown late increases the necessity for some fertilizer that will stimulate the young growth at the earliest moment, so as to strengthen it against the Winter.

M. A. A., Peru, N. Y., asks, 1, how to protect his asparagus this Winter; 2, the best early potato for sandy soil—is the St. Patrick good; 3, where can seed potatoes be obtained.

ANS.—1. Cover with a mulch of leaves or straw after cutting off near the ground. It requires but little protection. 2. The Beauty of Hebron and Early Ohio are both good varieties. We know but little of the St. Patrick. 3. At any prominent seed store.

E. W. K., Glens Falls, N. Y., asks when should Sweet Vernal Grass be sown.

ANS.—We should now prefer early Spring for the latitude of Glens Falls.

K. Mc C., Winchester, Va., sends leaf and flower for name.

ANS.—It is a double flower, and we cannot decide what it is without a plant.

THE
RURAL NEW-YORKER,
A National Journal for Country and Suburban Homes,
PUBLISHED EVERY SATURDAY.
Conducted by
ELBERT S. CARMAN.
Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.
SATURDAY, OCT. 22, 1881.

If the Rural New-Yorker is not received promptly when it is due, subscribers will confer a favor by notifying us at once.

We find it takes about twice as long to cut corn planted a foot or so apart in drills as it does when in hills. A farm hand should cut an acre per day of medium-sized stalks in hills. A single stroke of the corn-cutter usually cuts every stalk. But in drills every stalk has to be cut separately. We find that our men have averaged not over half an acre per day.

We regard Dr. Hexamer as one of our best judges of small fruits. In conversation with him the other day, speaking of the Souhegan, or Skowhegan, he says that he thinks it will take the place of Davidson's Thornless, with which it ripens. But, being larger and more prolific, it will go between late strawberries and the main crop of Black-caps. He pronounces it an early Doolittle, upon which it is a decided improvement.

Whenever the Rural says anything strongly in favor of a new strawberry, raspberry or grape, it is generally freely quoted in nurserymen's catalogues. But we have never yet seen an unfavorable comment quoted from the many unfavorable reports we have published. If we were to print only the favorable reports received respecting the seeds and plants which have been distributed by this journal, we should feel that we were if not misleading our readers, withholding at least, "the whole truth."

NEW LAWS FOR NEW YORK.

The laws passed by the New York Legislature at its last session have just been published, and among them a few are of special interest to dwellers in the country.

One of these is a law authorizing the incorporation of voluntary associations for the purpose of developing suburban homesteads or villa parks. Each association may buy lands, lay them out on the principle of landscape gardening, sell off lots and maintain such regulations for roads, walks and other embellishments, that each family may enjoy the drives, walks, shade trees and ornamental plants of the whole park. Such ornamental villa parks are frequent in the neighborhood of large cities in the Old Country, and are not unknown in the United States—witness Lewellwyn Park, N. J.—but heretofore such properties could not be easily managed in this State in the absence of suitable legislation.

There are two new laws for the encouragement of planting shade trees along the public roads and to punish any mutilation or willful injury to trees growing along roads or side-walks. Even hitching horses to these trees or leaving horses standing close enough to them to be able to injure them, is forbidden under a penalty not exceeding $10 for each offence.

Another law authorizes farmers to form associations anywhere in the State for the maintenance of agricultural fairs and exhibitions, and it is to be hoped that farmers themselves will in future take a more prominent part in the formation and management of such associations than they have hitherto done in most places.

THE VALUE OF MUCK.

The Rural has been criticized because in a late issue it copied, under "What Others Say," the article on the value of muck from the Journal of Chemistry. But the article in question was copied, not because it agreed with our views, but because it was quite opposed to them. And we supposed—so often have our views been expressed—that every attentive reader would know this without making comment necessary. When we planted the Rural Grounds (Bergen County, New Jersey), eight years ago, the "soil" with which the holes for the trees and shrubs were filled in was muck, dug out of a springy little valley running through the premises—the accumulation of many years of leaves and vegetable matter which had there collected and decayed. It was also liberally spread upon the land for small fruits, grapes and flowers, as well as upon most parts reserved for grass. All alike have grown luxuriantly. Rarely have we seen healthier specimens of trees or shrubs or those which make a greater annual growth. During the entire growing season we are obliged to cut the grass twice a week, unless the weather is exceptionally dry, and the grass still grows with undiminished vigor, though it has never received a dressing of manure or fertilizer of any kind. When so-called science and results disagree, we cling to results, and are prone to believe that so-called science has made a mistake, for true science never makes mistakes. It would be difficult, in the face of such experience, to make us believe that good muck is valueless as plant food. But there is just as much difference in so-called muck as there is in different soils. When we speak of the value of muck we refer to that sort of soil which results from decaying vegetation in moist or wet places. For the rest, we refer our readers to the article under "The Truth About It."

FOREST TREE SEEDS.

Now is the time for gathering seeds preparatory to raising forest tree seedlings next year. As the cost of gathering and sowing the seeds and cultivating the plants is but a trifle as compared with the prices demanded for the young trees by the nurserymen, and as there is the possible delay in delivery, heavy freight charges, and the risk of injury by the transfer, it is to the farmer's interest to raise his own seedlings. With proper care and attention there is but little reason why the novice in tree-raising should be obliged to record any more failures than the professional, the first and most important step being to procure the seeds at the proper time and to preserve them carefully until the season for sowing them arrives.

Some of our forest-tree seeds will retain their vitality but a short time after maturing, and, of necessity, such should be sown very soon after they reach maturity. In this class come the elms and red and silver maples, which ripen their seeds in Summer; but the seeds of various other kinds, as those of the nut-bearing trees, need not be planted until Spring. In fact, it is better to preserve such over Winter on account of the numerous insects, vermin and small animals which prey upon the seeds or nuts, and in the Spring they may be sown like vegetable seeds, the depth of covering to depend on the size of the seed planted.

For preservation through the Winter hard-shelled nuts, such as the hickory and butternut, may be mixed with a little ordinary soil and left in heaps out-of-doors; but chestnuts, beechnuts, acorns, etc., after the outer shell is removed, should be spread out in the shade until they feel dry; then place them in shallow boxes with alternate layers of clean sand, and when cold weather comes bury them in a dry place about six inches deep. This is done to keep the contents moist and at an even temperature. The more delicate seeds of the magnolia, basswood, etc., may be preserved in the same manner. We close as we began, by saying that now is the time to begin the work.

SULPHIDE OF CARBON AND THE PHYLLOXERA.

Sulphide of carbon has been extensively employed as one of the most effective remedies against the phylloxera, in France, Italy, Spain, California, and, indeed, wherever the pest has extended its ravages. The phylloxera, as is well known, kills the vine by preying upon its roots, and the usual mode of applying the sulphide is to place it in holes close to these. Here it soon evaporates and spreads about in the soil in the form of vapor, and it is this that kills the insect. At a late meeting of the Academy of Sciences at San Francisco, however, Dr. Behr, who has been extensively experimenting with the sulphide, said that as an insecticide he considered it "worse than worthless," inasmuch as it destroys the vine whether it kills the insect or not. In his experiments he has found not only that it always killed the roots with which it came in contact, but that in some cases it killed the phylloxera only after long exposure, the pest often surviving the roots to which it was attached. When sunk deeper than the roots he found it did not evaporate and it was at the same time useless and harmless. Professor Max Cornu, a well-known member of the Viticultural Commission of France, also writes that during a recent visit to the vineyards of Aude, Herault and Eastern Pyrences, he discovered that considerable injury had been done by the application of sulphide of carbon. The roots of vines too close to the holes in which the stuff had been deposited he found partially or completely dead. Moreover, as water dissolves one one-hundredth of the sulphide, this dissolved part, coming in contact with the roots after heavy rains, causes severe disaster, for he, too, found that "where this agent touches the bark of the roots it strikes them dead." Vines, whether affected by the phylloxera or not, that had been treated with sulphide, he found presenting very often a yellowish appearance of the leaves, while the vegetation was tardy, irregular and interrupted, so that an untrained eye would mistake the effect of the sulphide for that of a severe invasion of the phylloxera. The sickly appearance ceased where the application of the sulphide ended. Is this another case where the treatment is as dangerous to the life of the patient as the injury?

PROTECTION FOR WESTERN HERDS.

In an article under the caption of "A Proposed Western Embargo on Eastern Cattle," in the Rural of Sept. 24, we said that while our record showed that we had always urged the necessity for the adoption of some effective means to protect the vast herds of the West from the contagious pleuro-pneumonia which for the last few years has existed here and there among the cattle of some of the Atlantic States, still we thought that this object could be accomplished by some measure less sweeping than that pressed upon Gov. Cullum, of Illinois, by the Treasury Cattle Commission—a nearly absolute embargo on the westward transportation of all cattle from New York, New Jersey, Pennsylvania, Maryland, the District of Columbia, and Virginia. At the same time we stated—what experience has amply demonstrated in numerous cases—that the great risk to the public interests from a special commission lies in the fact that it feels bound to justify its existence by exaggerating the danger it was created to investigate. Quoting this sentence, apart from the context, a late issue of the Chicago Tribune sees in it an intimation of personal feeling which shows that the first move of the Commission is looked upon with unjust suspicion. We have absolutely no personal feeling in the matter. Our only desire is to guard and promote the best interests of farmers and stock-owners in all parts of the country. While anxious that those of the West should be protected from loss by contagious diseases, we are also anxious that this should be done with a minimum of hardship to those of the East.

As we stated in the above article, contagious pleuro-pneumonia when most prevalent in the States named above, was confined to a few cases here and there, according to the testimony of the veterinarians appointed to investigate the matter, of whom Dr. Laws, a member of the Cattle Commission, was one. In New York, New Jersey and Pennsylvania vigorous measures have been taken for the eradication of the disease, and it was officially announced some months ago that it had been extirpated from Pennsylvania, while in all the other States its ravages have been greatly circumscribed. Indeed so few are the cases now existing in the region it is sought to schedule, that it is by no means easy to find one. In our large correspondence with residents in all parts of that country the disease is scarcely ever mentioned. In the local papers, too, it is seldom or never referred to. One may travel for days through the farming districts without ever coming across a case or even hearing of one. In a late issue of the Iowa Homestead, Dr. Knapp, of the State Agricultural College, an excellent authority, after quoting our article above referred to, says it is worthy of grave consideration. He had lately been traveling extensively among farmers in this section, and had heard of only a few isolated cases. Mr. Howard, an acquaintance of his, had the same experience. Within the last fortnight we have questioned several gentlemen who travel a great deal among farmers in the Atlantic States, and the cases any one of them has seen or heard of have been very few and mild. If the disease is so prevalent in the Atlantic States as to justify such a sweeping measure as that recommended by the Commissioners, in justice to the farmers of the country these gentlemen should specify the places in which it prevails. Isolate affected herds or even sections rigorously; but for the sake of a sick cow or two at long intervals is it necessary or just to quarantine all the herds of so vast a territory? The Western herds must be protected at any cost, but justice and expediency demand that the cost should be made as light as possible to the stock-owners of the East who wish to sell their cattle, and to those of the West who wish to buy them.

BREVITIES.

On the night of Oct. 5, at the Rural Grounds, there was the severest frost ever known in that neighborhood for the season. Turnip tops were frozen and even celery harmed.

The Pocklington Grape is certainly showy. It seems to us that in quality it is decidedly sweeter than the Concord, while, except in color and size, very much like it in all other respects.

Take dry sand 20 parts, wood ashes, five parts; sulphur, one part, and mix together for dust baths for poultry during the Winter months. Place this in large boxes and keep them sheltered from rain. Whitewash the houses now and later, kerosene the perches, and your poultry will not be troubled with insects.

In Great Britain after 1883 the farrier and the cattle doctor will be superseded by men who must pass a strict examination with regard to the diseases of horses, cattle, sheep, swine and dogs. Doctors of stock will have to pass through a regular course of study just like doctors of men. The sooner the same rule is enforced in this country the better for our stock and our men—at any rate for those of the latter that own the former or are interested in them alive or dead; and who isn't?

The question of a right of way was decided on August 23 by the Supreme Court of California in the case of Carey vs. Rae. Such a right does not originate in mere convenience; it must spring from an express grant, or from an implied reservation, or from a usage for a length of time sufficient to create a prescriptive right, or a bar under a statute of limitations, either of which is presumptive evidence of a grant. The right to pass over the land of another as a necessity, because the regular road is impassable, ceases with the immediate necessity.

According to telegrams from Atlanta, Ga., the managers of the great Cotton Exhibition have not yet completed their arrangements and the exposition will not be fairly under way until November 1. How is it that although the best men are always presumably selected to manage such shows, they are never, yes *never*, ready by the appointed day, however long the time for preparation, however assured the promises of promptitude and however be praised the executive abilities of the managers.

In the case of Echenrode vs. the Chemical Company of Canton, Md., a contract had been entered into to make and deliver a certain amount of phosphates at a specified price; the manufacturer had given notice that he was ready to make and deliver them, but the other party to the contract refused to receive any, whereupon an action was brought for damages. The Maryland Court of Appeals lately decided, through Judge Miller, that the plaintiff could recover, as damages for the breach of contract, the difference between the cost of manufacture and the prices agreed upon.

The persecutions to which the Jews are being subjected in Russia are forcing great numbers of them to seek homes in less bigoted countries, and many of them have already arrived here and still more are expected. A committee of prominent Hebrews has been formed in this city to provide for the immediate wants of their immigrant bretheren, and to seek places of settlement for them in different parts of the country. Already 160 families have gone to Texas, most of them to engage in agriculture—at any rate until they realize that more money can be made by their race in trade than in the vocation for which their ancestors were renowned in the days of Jewish independence. Last week the State of Louisiana offered to the committee 160 acres of its most fertile land for each and every family of these Jewish immigrants willing to settle there—we wonder whether a like offer is open to Christian immigrants, or even to Christian natives.

The Michigan Relief Fund has already received $104,387 from this city and over $53,000 from Boston which contains about one-fourth of the population of New York; but while the latter contributed upwards of $250,000 to the Garfield Fund the former's contribution was under $20,000. In supplying the wants of the suffering community the South has vied with the North, the West with the East, the more distant places donating money; the nearer, clothing, lumber, provisions, grains for seed, and utensils of all kinds. Energetic distributing committees have placed the vast supplies where they have done the most good. The immediate wants of all have been relieved, a good area of wheat has been sown, temporary buildings erected, and cattle supplied with fodder—but while harvest is far off, Winter is close at hand, and the generosity of the country must still supply large sums to prevent absolute starvation. Governor Jerome has appointed a commission of prominent men which will hereafter have sole charge of everything pertaining to the relief of sufferers in the burnt district. All future contributions should therefore be sent to Ex-Gov. H. P. Baldwin, Chairman, Fire Relief Commission of Michigan, Detroit, Michigan. All who have not sent in the price of that "Michigan Bushel" of wheat should forward it promptly to this address.

Societies, &c.

THE GREAT ST. LOUIS FAIR.

[RURAL Special Report.]

THE 21st annual fair of the St. Louis Fair Association opened at St. Louis, Oct. 3, and closed Oct. 8. The rain which commenced on the 1st inst., continued right along up to Tuesday and put the grounds in a fearful condition; mud was so deep that up to Thursday it was almost impossible to get around the grounds. If the Society had shown a little more enterprise and laid boards at the crossings it would have been a great accommodation to visitors. Wednesday the weather cleared up and by Thursday the grounds were sufficiently dry to render them passible. The attendance was nearly as great as last year, and if it had not been for the rain this would have been the most successful fair ever held by the Association. As it was, the receipts ran over $75,000 and after all expenses are paid there will be a handsome balance in the hands of the Treasurer. The show in all departments was very good, but the exhibits were not as numerous as last year. The grounds are so large that it takes a long time to get a correct idea of the great amount of stock and machinery on exhibition. Probably to avoid rivalry or contrast with the grand display at Atlanta, there was no exhibition of cotton this year. The ampitheatre has probably the finest ring in this country for showing cattle and horses. Sup't. Filley's rules were carried out to the letter, and no owner of an animal was allowed in the ring while his cattle were being judged. This with the good selection of judges makes the awards at this fair worth something more than the mere amount of the premiums. Judges here are not paid, but Mr. Filley admits that eventually it will be necessary to pay expert judges for each class.

The cattle shown in the area included 44 Devons, 38 Herefords, 36 Short-horns, 42 Polled Angus, 37 Ayrshires, 21 Holsteins and 38 Jerseys. There were about 100 more on exhibition or that arrived too late to compete for premiums. The low water in the river and the difficulty of getting cars prevented a number of Missouri and Kentucky breeders from exhibiting. Nearly all the premium herds from Peoria and Chicago were present, and most of those from the former place were equally fortunate here. Messrs Hoover & Co., of Columbus, Ohio, carried off all the herd and sweepstakes prizes in the Jersey class with their fine Eastwood herd, although among their competitors here were the same animals that defeated them at Peoria; but, then, all acknowledge that the judges here were much more capable than those at the Illinois State Fair. The Unadilla Valley Dutch-Friesian herd carried off all the premiums in the Holstein class, for at these fairs all the cattle from the Netherlands are grouped together in the Holstein class. Messrs Potts and Palmer divided the Short-horn honors, while C. M. Culbertson carried off the principal prizes in the Hereford class. The show of Polled Angus was very fine. Frank Redfield of N. Y. with his young herd won the young-herd prize and two sweepstakes.

The sheep show was large and excellent. Mr. Cooper's fine flock of Oxford Downs attracted a great deal of attention. Long and middle wools are the sheep for this section, and they filled the greater part of the exhibit.

The swine show was good, but not up to that of last year.

In the agricultural and machinery departments the display was even larger than last year, but there was not as much variety. The show would have been still larger had it not been for the blockade on the railroads. Some exhibits shipped 30 days before the fair have not yet arrived. Fairs pay the railroads well—especially out here in the West—and the railroads ought to interest themselves more and see to it that goods intended for exhibition get through in time, and shippers should patronize the roads that accommodate them in this way. The larger class of machinery such as thrashers, engines, saw-mills, hay and cotton presses were here in strong force.

Many new buildings and additions had been made during the year, and these were well filled with all the new and improved agricultural implements made for this section of the country. Houses like John Deere, Deere, Mansur & Co., the Moline Plow Co., the Oliver Plow Co,, the Whitman Agricultural Co., J. A. Field & Co., etc., had fine buildings of their own for the display of their goods. Messrs. Deere & Co.; showed a new power lift on their Gilpin sulky, for throwing the plow out of the ground. It is a very simple application and takes well. Walter A. Wood's new automatic binder also attracted a crowd of interested inspectors. The Plow display was large. One of the interesting features of fair was a test of traction engines on the grounds. The "Vibrator," "Case," "Canton Monitor," Hooven, Owens & Co., "Belleville," "Gaar, Scott & Co.," and "Ritchie," were all tested for the purpose of ascertaining the amount of the direct draft of each on a level.

The J. I. Case engine attracted more than ordinary attention on account of the large amount of power developed. Its large area of fire surface gives it steaming advantages that place it in this respect far ahead in this line of engines. It is simple and easy to manage; every lever, wheel and valve is under the control of one operator. A few hours' practice will enable the average farmer or thrasherman to fully understand and run it. This is something that farmers are looking for, and Messrs. Case & Co. have taken the greatest pains to make this engine as simple as possible. Mr. Steven Bull, the Vice-President of the company, and Walter Dutton, General Agent, had Mr. Walrath, the superintendent of the works, on the ground, to thoroughly explain and show up its great traction powers. The engine was attached to another traction engine in full gear, and drew, on a dead level, equal to over nine tons, and this on the soft, clay ground and with only 85 pounds of steam, at the same time running the air pressure up to 65 pounds with apparent ease. The wheels are a great improvement, as they are made extra-large and are entirely of wrought-iron, with broad tires, giving greater direct draft than can possibly be obtained from smaller wheels. Another great improvement is the square-bottom boiler, the ash-pan of which can be readily detached, giving the operator easy access to the interior of the fire-box for examination and repairs if necessary. The crown sheet is strengthened with heavy wrought bars firmly riveted in the strongest manner, and it is also provided with a well-arranged safety plug as a precaution against explosion in case of carelessness—a great advantage. Another is the peculiar arrangement of the traction gear: it is constructed in such a manner that when all of the gears are thrown out, the engine can be drawn from place to place as an ordinary portable engine, without the friction and wear of the gears common in other engines. It is geared to run seven miles an hour on a good road, and it can easily do it. Messrs. J. I. Case & Co., Racine, Wis., its builders, also exhibited their new "Agitator" thrasher. They run the largest works of this kind in the world.

The Deering New Automatic Twine Binder, shown in operation by W. F. Olin, general agent for Wm. Deering, Chicago, Ill., was among the most interesting of exhibits. The remarkable success that this binder has met with—over 8,000 of them having been sold and put into active service during the past year—is evidence enough to show how well it takes with farmers. The enterprise of the manufacturers is shown in the improvements constantly being made, they having added this year an iron cutter-bar, a new device for raising and lowering the platform and a perfectly adjustable reel, with two motions by a single lever at all times under the control of the operator. This is an automatic binder and has a canvass grain adjuster that evens up the butts, a very valuable improvement, as it allows the farmer to take up tangled-down and short grain in the best possible manner. This binder, like all of Mr. Deering's goods, was very handsomely finished. Mr. Olin also showed Deering's new iron mower. This is an entirely new machine which has just completed its first season, and has met with a success second only to that of the binder. It is a model of compactness and simplicity. Mr. Deering also makes the Leader Reaper and Warrior Mower. These machines are well known all over the world. One of the largest factories in this country is being run to its fullest capacity and 1,300 men are given employment in turning out the Deering machines.

One of the largest and handsomest displays of carriages ever made upon a fair ground was that made by Deere, Mansur & Co., the Southwestern branch house of the Cortland Wagon Co., Cortland, N. Y. They were awarded the first premium for this display, and well they deserved it. They showed 50 jobs and 42 varieties of platform and three-spring wagons, buggies and phaetons of all descriptions and surrays. The Cortland Company by turning out none but the best goods in the market and paying especial attention to style and finish, have worked up an immense trade in this great Southwestern market. This branch alone has sold over 4,000 buggies and wagons the present year. It speaks well for one of our New York institutions when they come way out here and control a trade like this right under the noses of our large Western manufacturers; but Mr. Fitzgerald, the president of the company, had the pluck to work up the trade before the others got in, and now by putting out a superior line of finished goods he proposes to hold it.

The first premium for largest and best display of Missouri machines was awarded to the Whitman Agricultural Co., St. Louis, Mo., on their fine exhibit of corn shellers of all sizes and description, feed cutters, Young America and Monarch corn-and-cob mills, cider mills, etc. This company made a very handsome exhibit, which they will probably exceed another year, as their new factory at Clark and Eighth Streets, is now in full blast and their increased facilities for manufacturing will give them a chance to enlarge their line. They have improved their celebrated Young America and Monarch corn-and-cob mill this season by adding *cast-cast* steel grinders; all the bearings, too, are now chilled and they have increased the thickness of the cone and strengthened the breakers. These popular mills are so well known that a detailed description would be superfluous.

THE St. Louis Branch of the Gibbs & Sterritt Manufacturing Co., Corry, Pa., made a large and handsome exhibit of Climax mowers and reapers and self-binders. To meet the demand of the times this enterprising firm have added to their list, this year, the new Climax automatic self-binder. This is a twine-binder on the packer principle and has stood the past season very sucessfully. It has been thoroughly tested in the field, and the company propose to put it in the market next season on its recognized merits. The new front-cut Climax light mower attracted a great deal of attention. It is a light, compact and simple machine. Its gearing is inclosed in a neat, iron case. The crank shaft has bearings in front and behind the pitman head, obviating the motion produced when the crank shaft is overhung, and giving a strong and even motion to the knife. This is an important improvement. The Climax machines are constantly gaining in favor, and both the Chicago and St. Louis houses report an excellent year's business.

A great portion of the main building was occupied by the large and varied display of drills made by the St. Louis branch of P. P. Mast & Co., Springfield, Ohio. They showed the Buckeye spring-hoe drill, the Buckeye spring-pressure shoe drill, the old reliable Buckeye hoe drill, the Buckeye combined fertilizer and force-feed grain drill, and also a full line of Buckeye three and five-hoed drills, cultivators, sulky plows, cider mills, Buckeye spring-tooth sulky harrows, broadcast seeders, etc. This firm makes drills to suit any and every section of the world where grain is raised, and their reputation is so fully established that sales are made on the name alone. The St. Louis branch has doubled its business within the year. The main factory at Springfield, Ohio, is the largest in this line in the country, and it is run to its fullest capacity to meet the demand for the Buckeye goods.

An exhibit that attracted a great deal of attention was that made by the Vandevere Corn Planter Co., Quincy, Ill. They had the larges and finest show of planters on the grounds, including the Barlow Rotary, Vandevere and Quincy planters. A distinctive feature in the Barlow planter is the rotary or revolving seed cup, by the use of which the corn is sown five hills in advance. This planter is also noted for its regularity of drop. I have seen it set to drop a single kernel and it did not miss once in 1,700 times. This makes it very effective in drilling corn, as its drilling attachment can be set to drop from 12, 15 and 18 inches, and its regular work should always insure a good stand. Thousands of these planters are now in use, and the demand the past season far exceeded the supply.

The MOLINE WAGON Co., Moline, Ill, showed one of the handsomest farm wagons ever put out upon a fair ground. This wagon was fixed up differently from the ordinary run of fair exhibit goods in that it fully represented a fair sample of their regular wagons, and the work was all in the finish. The Moline Company have doubled their manufacturing capacity within the past year, and are now putting out 60 finished wagons a day. Their goods have attained a high reputatio for superior quality, finish and lightness of draft, and meet with full approval wherever introduced. They make a full and complete line of spring, half-platform, three-spring and farm wagons of all kinds to meet the demands of all sections of the country.

A full line of haying implements was exhibited by J. E. Porter, of Ottawa, Ill., including the well-known Porter wood-track hay carrier, hay derricks, etc. As usual, Mr. Porter carried off the first premium at this fair.

Miscellaneous.

SAUK CENTRE, MINN.

A Hasty Glance at This Busy City.

MESSRS. HOLMES AND SWEETLAND.

[Special Correspondents of the RURAL NEW-YORKER.]

PROMINENT by virtue of its location and excellent surrounding country; progressive from the activity and energy of its business men; proud of the advantages and inducements which it is able to offer to capital and labor to locate here—thus we found this thriving little city. It is incorporated, and by last census numbered 1,211 souls, now estimated at 1,500 to 1,600. It has an admirable location in the midst of "The Park Region," 117 miles from St. Paul, on the "Short Line" of the St. Paul, Minneapolis and Manitoba Railway. Near it, and within easy access, are Big Sauk (upon which it borders) Birch Bark, Cedar, Fairy (2¼ miles north) Whipple, Villard and Osakis Lakes: all beautiful bodies of water, abounding in fish. Several of them are becoming popular resorts. Around them may be found quantities of game—wild geese, ducks, prairie chickens and partridges, with deer and bear for those seeking larger spoils.

Land about Sauk Centre can yet be purchased (wild) at from $4 to $10 per acre. It is a good stock country with timber lands to the north and east and prairie to the south and west, upon which are large yield of cereals and root crops. Michigan Winter apples are obtainable at from $2,50 to $3,00 per barrel.

Besides the railroad mentioned, this city will have the Little Falls and Dakota, now being constructed to connect with the Northern Pacific and with Duluth's projected lines—operated by the N. P. The Sauk Centre and Northern is now being surveyed from here to the magnificent hard-wood timber region of the North, and one or two other lines are projected. Thus it is rapidly assuming the position of a railroad center.

The town itself is well laid out, with wide, clean streets, substantial business houses and neat residences. There are five churches—Episcopal, Congregational, Baptist, Methodist and Catholic. There is also a good brick school building, value $13,000, well ventilated, with seven departments and as many teachers. Various orders are represented by flourishing lodges; A F and A M; I. O. O. F.; I. O. G. T; T of H; and K of H. There is an efficient volunteer fire department. Two excellent newspapers, the "Tribune" and "Herald," contribute largely to the advancement of intellectuality and social union. A Board of Trade has been recently organized, the object being to concentrate the energy of many into one body for the protection and advancement mutual interests, and surely the importance of these demands it. The secretary will give attention to letters of inquiry. The commercial business of the past year was $1,371,950; bank capital $100,000, with an aggregate business of fully $4,000,000. The wheat marketed here was over 500,000 bushels, thus showing it a centre of trade. The county has no indebtedness and that of the city is light. It is mostly peopled by Americans, with a small foreign element. In manufacturing we found two flouring mills—one water and one steam, the latter having received the State premiums for its flour. There is, too, a manufactury of fanning mills of world-wide reputation, and a foundry. There is a good water power only partially utilized. As an aid to the labors of our enterprising citizens, to become a large and thriving city Sauk Centre only needs agricultural implement and wagon factories (to use the abundant hard wood) a canning establishment, a creamery and cheese factory, a custom flouring mill and the attention of the better class of immigrants.

CATALOGUES, ETC.

THE JOURNAL OF THE AMERICAN AGRICULTURAL ASSOCIATION for 1881 will contain, among other articles, "A Description of a Model Dairy and Stock Farm," by Francis D. Moulton, with fifteen pages of illustrations, and articles on "Sheep Husbandry in the South," by Colonel J. H. Moore, of Kansas; on "Farmers and the Tariff," by Prof. Arthur L. Perry, of Williams College; on "Co-operative Experiments with Fertilizers," by Prof. W. O. Atwater, of Wesleyan University; on the "Relation between Seeding and Quality in Fruits and Vegetables," by Dr. E. Lewis Sturtevant; on "Agricultural Education for the Young," by Dr. Byron D. Halsted, and on "The Railroad and the Farmer," by Hon. Edward Atkinson, with a reply thereto by Hon. L. E. Chittenden, President of the Anti-Monopoly League. There will also be an article fully describing the RURAL NEW-YORKER'S, Experiment Farm. Beginning with this number the Journal is to be published quarterly, the next number appearing in January next.

THE WILD GARDEN, by W. Robinson, F. L S. Published at 37 Southampton Street, Covent Garden, London, England, and by Scribner & Welford, New York. Illustrated. The author is the originator of what has become known as the "Wild Garden" system, which consists essentially in placing "perfectly hardy exotic plants in places and under conditions where they will become established and take care of themselves." The work before us consists of 179 pages, is substantially bound, nicely printed in clear, bold type, and illustrated with numerous engravings by Alfred Parsons. In it the author sets forth his idea of what a "wild garden" should be, and tells what different orders of plants may be utilized in producing the best results, and how. Some years since Mr. Robinson contributed several articles to the RURAL NEW-YORKER on the "Wild Garden," and the idea was rapidly taken up in America, England and France. We commend the book to all, and especially to those who delight in transforming "unseemly" places into gardens of beauty. It is our desire and intention to refer to this valuable work again.

Literary.

THE STRANGER ON THE SILL.

BETWEEN broad fields of wheat and corn,
In the lowly home where I was born;
The peach tree leans against the wall,
And the woodbine wanders over all;
There is a shadowed doorway still,
But a stranger's foot has crossed the sill.

There is the barn—and as of yore,
I can smell the hay from the open door,
And see the busy swallows throng,
And hear the pewee's mournful song;
Out the stranger comes—oh, painful proof,
His sheaves are piled to the heated roof.

There is the orchard—the very trees
Where my childhood knew long hours of ease,
And watched the shadowy moments run,
Till my life has imbibed more shade than sun;
The swing from the bow still sweeps the air,
But the stranger's children are swinging there.

There bubbles the shady spring below,
With its bulrush brook where the hazels grow,
'Twas there I found the calamus root,
And watched the minnows poise the shoot,
And heard the robin lave his wing—
But a stranger's bucket is at the spring.

Oh, ye who daily cross the sill,
Step lightly, for I love it still;
And when you crowd the old barn eaves,
Then think what countless harvest sheaves
Have passed within that scented door
To gladden eyes that are no more.

Deal kindly with these orchard trees;
And when your children crowd your knees,
Their sweetest fruit they shall impart,
As if old memories stirred their heart;
To youthful sport still leave the swing,
And in sweet reverence hold the spring.

The barn, the trees, the brook, the birds,
The meadows with their lowing herds,
The woodbine on the cottage wall—
My heart still lingers with them all,
Ye strangers on my native sill,
Step lightly, for I love it still.

THORNS AND ROSES.

(Continued from page 690.)

Lost to outward things, he read on, comparing the text with manuscripts before him, until something in one of the papers puzzled him; he bent over it closely, then turned to the accumulation on the table in search of a missing link. His hand touched something, neither book nor paper, but a little knot of rose-colored ribbon, and his pale face flushed, as, rising, he pressed it to his lips.

"My books," he sighed, "you are dear to me, and I have made you my companions; but you cannot, you cannot give me human love! She was right," he said, pausing by the old escritoire, "one Lovel must remain alone. But I dare not let this mood grow on me!"

With an effort he resumed his search for the paper in the escritoire, and touching something cold under the dusty heap, he brought it out, then dropped it suddenly.

It was a dagger with a carved handle—a blade marked, it seemed, with rust.

Brandon's face, if pale before, was livid now, and filled with a dread and horror impossible to describe; great drops started on his forehead; he looked at his hands as though he expected to see stains on them, and shuddered.

"Why this night of all others?" he groaned, "can nothing blot out the past and efface that red stain from my memory at least? Will it come—shall I be found? Oh! Heaven, do Thou have mercy on me!"

The face bent on the trembling hands was convulsed with agony; the strong frame quivered from head to foot; and even the entrance of the old housekeeper did not rouse him.

"Brandon—Mr. Brandon! What is it?"

"Look," he said, shrinking from her touch, "I came on this to-night! To-night, of all others!"

"Oh! Mr. Brandon, why have you kept it?"

"To-night," he repeated, "this ghastly anniversary!"

"Dear master, for the love of heaven, forget it!"

Ah! Anna, the past is eternal, and my struggles are vain. But this, at least, shall go."

And as he spoke he plunged the dagger into the burning embers, then sank into his seat, laying his arms on the table, and there resting his head, whilst the old woman stood with wet eyes, whispering words of comfort. But at length he looked up with his old melancholy smile.

"You needn't fear, Anna. I could not help—just then. Leave me now."

He watched her as she walked away, meeting her backward glance with the same forced smile.

But when alone, he walked to the window, and stood gazing out, with dark, weary eyes, and quivering lips, at the quiet glory of the Autumn night, as though he sought for peace!

CHAPTER VI.

WHEN Winter had come, with "his frosty, merry train," we were necessarily much confined to the house, and therefore the days were more monotonous than had been those of Summer and Autumn; but in spite of this, Edith declared her intention of remaining at Lovel House, and had written home to that effect. She lamented to me that no rich suitor had appeared, though, she argued, it proved the world's bad taste in thus neglecting her. I was rather surprised that she stayed here.

"Why, my dear cousin," she said, when I one day expressed this surprise to her, there's only home for me to go to, because papa likes us all to be together at Christmas: and its either home or Lovel House. I can't stand Mrs. Hawdon's charity dinners and blanket-distributings. They are perfect nuisances, not to speak of the prosy people she gathers round her for so-called festivities; and I choose to stay here. Shall we go out? I'm sick of the house!"

I agreed, and we presently left the house together, walking through the village, with its cottages roofed in snow and the bright flame of cosy fires shining through the windows. There was an old woman whom I specially wished to see, and when we reached the crooked, one-eyed building that was her home, I proposed to Edith that we should both go in.

"Not I, Kate! I have no fancy for these stuffy little rooms and 'poverty's counsel.' You go as you like it, and I will wait outside;"

I went in alone and found the old lady very ill and equally cross. A little cluster of winter blossoms brightening the dingy room had, she informed me, been brought by Mr. Brandon himself, who had also written a letter for her to her married son. Musing on the peculiarly delicate kindness with which my kinsman was endowed, I bade farewell, and went out to the street, looking for Edith.

At no great distance I perceived her talking eagerly to a gentleman who leaned on the gate of a cottage garden—"that stranger" who had taken to haunting our daily walks. An unusual feeling of annoyance stirred within me. I went on, looking anything but amiable.

Edith was not in the least embarrassed or confused. She looked at me with her own cool self-possession, her expression unchanged.

"I hope you found the love-lorn one better? Allow me to introduce you to a very old friend of mine, Mr. Edgar Dana."

Mr. Edgar Dana bowed, coloring slightly, and glancing half-deprecatingly at me; but I returned his salute coldly, and looked at Edith with, I hope, some of the contempt I felt. Glances, contemptuous or otherwise, were thrown away on that young lady, for in return she gave me her sweetest smile, and extended her hand gracefully to the stranger, saying:

"Good-by for the present, Edgar. We shall be very glad to see you at Lorel House. Come, Kate."

She turned away, and I followed, so utterly bewildered that speech for some moments was impossible; and then, when I recovered, it was prevented by the appearance of Nevil Verner, who had been riding behind us, and now pulled up to address us, inquiring, after the usual greetings, if that were Brandon from whom he had just parted. Edith gave a side-long smile," not wholly dissimilar to that with which Lara favored his foe—if contempt, mischief, and disdain had any share in it.

"Don't you know Brandon when you see him? That is a new admirer of Kate's, who wants to carry her away. Aunt is broken-hearted."

"Edith!" I exclaimed, coloring indignantly, and angry with myself for doing so; but she laughed, and Nevil abruptly bowed farewell, riding away.

Edith set off at a rapid pace: but not being particularly anxious to overtake her, I did not hurry myself. She waited just inside the gates of Lovel House, and as I advanced, leaned against a tree, with a peel of merry laughter that made the garden ring; then cried, breathlessly:

"My dearest coz, you look just like an icicle. I think I have done you a great service to-day, so don't be angry."

"If you think I am angry because of your silly statement to Mr. Verner, you are much mistaken; but I think you have been guilty of great deception."

"If you are going to preach I am going in." And away she went along the avenue, I after her quietly, and entering the house, followed her upstairs, after announcing our arrival to aunt.

Edith was waiting in the dressing-room, and studying her face in the mirror.

"Now for the sermon, Kitty. How have I been guilty of deception, joy of my heart?"

"Who is the gentleman you introduced?"

"Your education has been strangely neglected if you never heard of the Dana's."

"Of course I have heard of them." I replied.

"Good angel of my life! Edgar is a relative."

"He traveled with you; he has been here ever since; and you pretended that he was a stranger. That is deception pure and simple, Edith; but I will not be a party to any further deception, whatever it may be."

And prepared for a battle, I sat down beside the fire, whilst Edith looked fixedly at me.

"Madam Gravity," she said, letting the shining coils of her hair fall down, "I said he was a stranger that day, because, ages ago, we had agreed to be strangers; we are so now, in a certain sense, so it is not deception."

"Ask yourself if you have been straightforward. You made me believe you had never met this Mr. Dana before, Edith, and you know it."

"Listen then, Kate, and I will tell you:

Edgar was once on very friendly terms with my people, of course in the days when he—did not go gipsying, but had expectations. He was an orphan-ward of an old doctor in this county, but lived near us, society receiving him favorably, as it was popularly supposed he would inherit his guardian's savings. I was a school-girl, he a 'collegian,' and during holiday-time we were a great deal together, and as was inevitable, we fell in love. It was considered a good match, but we were absurdly young, and marriage then was out of the question. But there was an engagement, tacitly acknowledged, until the doctor died intestate, his property was claimed by the next of kin, and Edgar's fortune "scattered was to wintry winds." As soon as this was known there was a call to arms, a gathering of the clans, and a general uproar. Edgar was cut by his great relatives, and banished with the information that he was a clever young man, and the world was a wide field of labor for clever young men, especially if they were penniless. Then he was summoned to my home, but we had no "Lucy and Master of Ravensword" performances. Papa was very kind, very polite, and of course Mr Dana knew as well as he did that Edith could not be expected to regard a childish promise as serious; and it might be better if he ceased his visits just at present. I had no wish to marry poverty, so I said 'Good-bye' and we agreed to be strangers. There was a farewell to the long letters, the homeward drives from dances, the walks, the foolish words, the stolen meetings——Oh! cousin, for nearly a month I cried my eyes out! I never saw anything of Edgar until last year, when we met at the opera. Papa was very gracious to him, because I was then half engaged to that rich old Mortimer, who died after of apoplexy. You can imagine my amazement last Summer when Edgar got into the compartment; there was a tragic start on his side. We met almost as strangers, and I gave him Lovel legends to prevent him speaking of old times. That is all, and now am I so wicked?"

"What is Mr. Dana doing here?"

"He is secretary to General Polwyn."

General Polwyn was a retired Indian officer who was writing a history of the war.

"Does your father know?"

"Never thought it worth my while to tell him."

"Then you are acting wrongly, and I can't allow Mr. Dana to come here, after what you have told me."

"Do you think I am mad, Kate? On my word, if I were dying of love for Edgar, I wouldn't take him unless he were rich. Papa once said, "Don't marry a poor man, Edith, for you would make yourself and him miserable;" and it is true. Edgar's poverty is an eternal bar!"

"Then why have anything to do with him?"

"Are you one of those stiff old things who call flirtation a crime? I can't cut Edgar—I won't! I shall tell papa, Kate; he knows me better than you do. He knows, and Edgar knows, that I shall go to the highest bidder, like a picture!"

"There is a wise proverb about playing with edged tools, Edith."

"Do you suppose I could forget our positions, or the difference between Miss Lovel and General Polwyn's secretary? Thanks for the compliment you pay my common sense!"

She was angry with me, I thought, and we dressed in silence; but ere we left the room she laid her head on my shoulder, saying:

"I wish, Kate, I were like you, and not selfish—not sordidly ambitious!"

The unusual gravity left her. She pointed at her reflection in the mirror, laughing:

"With that face I ought to win more than love in a cottage, even though I am only

"'A penniless lass wi' a lang pedigree!'"

I stayed behind a few moments; and when I returned to the parlor, I found aunt Dorothy looking slightly bewildered as Edith sang the praises of her newly-found friend. Later on she dropped me an airy curtsey, exhibiting a letter in her own dashing caligraphy.

"I have confessed all to papa, and have told him that you are afraid he will object to Mr. Dana's visits."

"Very well," I said. "If your father approves, I have no more to say.

For some days after our encounter with Mr. Dana, neither Edith nor myself had been out, as the weather was cold and stormy. Nevil had not called lately, and I was wondering if he were ill, when Brandon came, and he believed that all at Nevil Towers were well.

(To be continued.)

For Women.

CONDUCTED BY MISS RAY CLARK.

OLD-FASHIONED ROSES.

THEY ain't no style about 'em—
And they're sort o' pale and faded
Yit the doorway here, without 'em
Would be lonesomer and shaded
With a good 'eal blacker shadder
Than the morning' glories makes.
And the sunshine would look sadder
For their good old-fashion' sakes.

I like 'em cause they kind o'
Sort o' make a feller like 'em;
And I'll tell you, when I find a
Bunch out whur the sun kin strike 'em
It allus sets me thinkin'
O' the ones that used to grow
And peek in through the chinkin'
O' the cabin, don't you know?

And then I think o'mother,
And how she used to love 'em,
When they wuzn't any other,
'Less she found 'em up above 'em!
And her eyes, afore she shut 'em
Whispered with a smile, and said
We must pick a bunch and put 'em
In her hands when she was dead.

But, as I wuz a sayin',
They ain't no style about 'em,
Very gaudy er displayin',
But I wouldn't be without 'em.
'Cause I'm happier in these posies
And the hollyhawks and sich
Than the hummin' 'at noses
In the roses of the rich.

SUMMERING.

(Continued from page 689.)

IN the hotel dining room were gathered the usual variety of the human species. At the table next us was a group of three, whose manners, jewels and generally over-fed condition proclaimed them unfortunates with more cash than brains. The two ladies were especially below par. Such bangs! Only nabobs could have afforded bandoline sufficient to keep them in position, and alas! they trifled sadly with some of the proprieties.

After dinner we visited the new Mountain House, which stands farther south overlooking the same view as the old Mountain House. From there we went on to Sunset Rock, Haines Falls, and other points of interest. As we neared the town which was the limit of the day's travel, something was said about temperance, and Miranda remarked that she was quite ready to lecture that evening if we would procure a place for her. We proposed she should rehearse to us, and she immediately began.

"I conduct my lectures after the Socratic method," she said, whereupon she directed her questions to our driver, and as they were quite out of his line, his answers were preposterously wrong. She proceeded with scientific explanations and elaborate arguments, discovering to Mr. Q. such a knowledge of his internal structure and of chemical combinations and effects that the whole situation was infinitely funny to the occupants of the back seat. "Sugar is composed of carbon, oxygen and hydrogen," said she. "Oh, you can't come that on me!" interrupted her incredulous hearer, "I've seen 'em make sugar lots of times, and they never put any such stuff as that in it!" Miranda had been teaching chemistry and physiology and was President of the Juvenile Temperance Union, so she was "up" on her subject, and with merry peals of laughter she went on through the physical and moral phases of the theme much to Mr. Q.'s amazement and our amusement.

She emphasized her elucidations with many earnest gestures, the effect of which was hightened by the very demoralized condition of her gloves, which, though in a normal state when we started, had suffered untold things from their wearer's clambering up rocks, picking new botanical specimens, and from the stage, which had been newly varnished for the occasion.

At the conclusion of the lecture we found ourselves near our journey's end, and once more in the pleasant little town lying surrounded by mountains, we dismissed Mr. Q., who proved himself the model driver to the last, for he possessed the proverbially extortionate spirit which characterizes the class the world over, and though an agreement had been made for the distance, he assured us there was a misunderstanding. The guileless Miranda had not detected the far-off odor of that common species of vermin whose proclivity in such cases is distinguishable only to those who, to speak elegantly, have cut their eye-teeth, but Abigal and I had begun to reason within ourselves and were not surprised nor so ready to be persuaded. On principle I declared for the

stipulated sum, but decided that he had undercharged on the start to secure the trip, trusting to the weakness of "gullable" women for getting the rest at the journey's end. So we compromised and said farewell.

The next morning we took the stage at an early hour, and rode through Stony Clove—well named, for it was the roughest of roads. Through the Clove it was quite chilly, and ice lay in the crevices of the rocks. I braced myself at first, trying to keep somewhere, but finally let go, and went through a series of gymnastics that exercised every muscle in my body. We arrived in Phœnecia just in time for the train to Rondout, where our ways separated.

It was our first Sunday in the Catskills that we heard of the assassination of the President. The news did not reach us out there on the farm till the Sunday morning, and then we heard that he was dead. We went to church in the little school-house in the afternoon, and the itinerant preacher spoke of the terrible event, giving us our first reliable news.

I have looked in on several friends on my roundabout way back, have enjoyed the renewal of former acquaintances, and met many new friends that I shall not soon forget. Everywhere, too, I have found the national sorrow, and heard the new burden of prayer from the family altar. And to-day, as I write, there is still only a hope left.

The Summer is ended, and beautiful September is here. When we went away, the fields were white with daisies, and the mountain sides were flushed with the delicate waxy flowers of the laurel, and sweet wild roses blossomed everywhere. Fresh for the year's work, with a grateful remembrance of a lovely Summer, I came back last week through wildernesses of golden rod, purple asters, and the dark, rich, crimson sumach.

Sept. 19, 1881.

SPLENDID GIRLS.

If young ladies who indulge in handkerchief flirtation, or any other flirtations, could know how lightly their names are bandied about among the very young men who laugh and flirt with them, their cheeks would be dyed with crimson.

I have yet to see an older brother, who was not serene in his reproval of such deportment in the sister he loved, and whose fair name he wished to have held in high esteem. Modesty is the only current coin of our sex. No matter how much the customs of the age may seem to condone the opposite style.

In averting one extreme it is not necessary to be dull and stupid and prudent, and generally uninteresting. I know girls who are very queens in society, standing as high in the esteem of the young men, above the flirtation girls, as Mont Blanc is above the vale of Chamonni. "Splendid girls" is the universal verdict, but they would as soon think of flirting with a star. It is a grand thing to stand star-high in the estimation of society, and not be counted as a marsh will-o-the-wisp

These fine girls are generally well dressed even to daintiness, though their dresses may not be costly. Their gloves are as fresh as new laid eggs if only four buttoned thread ones, and their shoes always *look* new, although they may have been a year in service.

They have the little tricks of elegance which so enhance any toilet; the sprig of geranium leaves and blossoms nestling in the lace at throat, the dash of crimson ribbon on the quiet colored dress, the pretty wave or curl or friz in the hair, all giving a "light of hand" look to the appearance.

But the "splendid girl" knows something. She can talk sense with the boys, and give them confidentially, good advice on topics about which they consult her. She can take up the conversation when it turns on politics even, and is thoroughly posted on the events of the day. She is likely to have her prejudices and preferences in opinion, but she is a lady, and never brings them forward offensively. The flirtation girl looks on with sheer envy, and some bitterness, when she sees how she is sought after by the finest men in the room and how easy it is for her to carry on a spirited conversation.

But after all it is the thorough goodness of her heart that is the chief charm of the girl. She is ever ready to do a kind act to any one, and she has calls enough on her time and talent, and she likes it, and never complains. It is worth some effort to attain to such a standing in any community.

J. E. McC.

FASHIONS.

It will certainly be hailed with satisfaction by ladies who have been bewailing the extravagance of fashion, that dresses appear likely to be made up a great deal more plainly than they have been for many seasons past during the coming Autumn and Winter.

The reason of this is, obviously, the return to handsome fabrics, such as brocades, satins, and more especially the particular kind of watered silk known as French moiré. This last has been given up so long that it is almost unknown by the present generation of young ladies, and now comes to them quite fresh and new. It is the same with all materials, and in general with all things appertaining to fashion. But it is seldom things thus taken up again appear or are used in exactly the same way as before; thus, moiré is employed this Autumn chiefly in combination with other fabrics, such as cashmere veiling, and other fancy woolen materials. It forms the flounces, revers, plastrons, scarfs, and such like accessories of these fancy woolen dresses.

Young ladies who are debarred from wearing complete dresses of French moiré are allowed the use of this handsome material in the way of trimmings and accessories of the toilet. Skirts are less scant and clinging than heretofore, and trimmings are beginning to be put on plain rather than gathered or fluted. Lace is still a great favorite in the way of trimmings, but the choice just now is for embroidery.

The embroidery patterns are worked in silk or fine wool, instead of cotton, for the Autumn and Winter. Flounces, put on almost plain, plastrons, revers, facings, cuffs, collars, and plain panels are embroidered in this way with silk or wool, either of another shade or of a contrasting color.

Ladies possessing dresses of French moiré, long put away on account of the inconstancy of fashion, will do well to cut them up and use them in combination with cashmere, making up a pretty and fashionable toilet. They need not grieve at the cutting-up business, for, as before said, though fashion takes up things that have long been laid aside, it is never quite in the same way; and it would be an error to suppose the moiré dress of twenty years ago would ever be fashionable again exactly as it is.

Checked and striped woolen fabrics, checked serges—notably with striped borders for trimmings—light flannels, French and American bunting, cheviot cloth, and limousine are favorite materials for Autumn costumes, which are invariably made with the short round skirt. The skirt is either pleated all the way up to the waist, or trimmed with flounces put on in wide flat pleats or hollow pleats divided by plain spaces. In the latter case, some semblance of a scarf-drapery is generally arranged over the upper part of the skirt and loosely tied behind.

Bodices are made up in a variety of ways. There is the basque-bodice, with rounded basque in front, and either a plain or plaited postilion behind; and there is also the peaked bodice, with flat paniers at the sides, and the round waist bodice, worn with a belt and shirred at the shoulders and at the waist.

Most sleeves are now made with small revers at the top matching the rest of the trimming. Sometimes the cuff is omitted, and the sleeve is made semi-short, and so tight that the long glove can be slipped over it.

Elegant cloth jackets for the Autumn are made tight-fitting and double-breasted. Dark green is the favorite color, and bids fair to supersede the long popular seal-brown, for the Autumn and Winter.

A mantle of mixed style, very convenient for traveling, is a sort of semi-fitting palctot, fastened all the way down with buttons, finished with a long pointed hood, edged with silk cord, and falling down over the puff at the edge of the back. This serves as a mantle, and if worn over a short plain skirt with a fluting round the bottom, it forms a very useful costume for the morning, for excursions, or simply for home.

Mantles of a dressy style are made either in the sacque shape or in the Mother Hubbard fashion, shirred across the shoulders and in the back. These shapes seem likely to prevail through the Autumn for mantles of heavy silk and satin, while the redingote shape is preferred for cloth garments. The black satin pelisse, lined with bright-colored satin and trimmed with black Spanish lace, forms a nice transition between the light Summer mantle and the heavy fur cloak of the winter.

TABLE MATS.

Mrs. Sweet's reference to table-mats, reminds me of a cheap, serviceable set I once saw.

A lady who was living far from the city, wanted a new mat or stand for her coffee-pot and being unable to procure one, she took a straw-bonnet (stone color) and ripping the braids apart, sewed them together again, in a flat, round shape, lining it with a piece of thick cloth, and a piece of stiff wigging.

This was so neat and serviceable that she bethought herself of a number of discarded, white, straw hats and bonnets in the attic, which she soon transformed into a nice set of table-mats.

Mrs. W. V. A.

CORRESPONDENTS' CORNER.

A request for a recipe for bleaching ferns received a few weeks ago was delayed for satisfactory information we now publish a reply clipped from the Art Interchange which answers it satisfactorily: "Ferns must not be bleached in the ordinary chloride of lime or soda; it is too powerful. Use Tilton's bleaching fluid. Lift them carefully by hand from the liquid immediately on becoming white and press very carefully between folds of a soft towel; then place between the leaves of a book until ready for mounting."

Domestic Economy

CONDUCTED BY EMILY MAPLE.

HOUSEHOLD NOTES.

MARY WAGER-FISHER.

"Our best quinces come from New York State," said a Philadelphia market-man to me the other day, and they're worth 60 cents the half peck. Most years they're about 40 cents.

"But I want half a bushel."

"'Twill be all the same ma'am, at the rate of 60 cents the half peck," so I paid $2.40 for my half bushel of quinces, thinking that New Yorkers could go into no more profitable business than quince raising. And why are quinces not more generally produced? Does it require more vigilance to keep the borers out of the stock, than to produce potatoes, bugs and all? And it would take nine bushels of potatoes at rather more than 50 cents a bushel to equal the value of one bushel of quinces. My neighbor says that stewed pears flavored with quince are delicious. But I like the flavor of the pear. Here, in the neighborhood of Philadelphia, the quince is so precious that its parings are cooked in order to extract the last drop of flavor, and quince jelly is considered the ne-plus-ultra of jellies.

A calico wrapper large enough in the sleeves to slip on over a dress, is one of the most convenient garments a housekeeper can have. There are many times when one wishes to be "dressed up," and still is obliged to put the finishing touches to a meal, to go into the cellar, to work about the stove, or to wash dishes, in the doing of which a wrapper slipped on over the frock will keep it from all soil.

It is a good time now to buy ready-made Summer garments, as most dealers are willing to sell measureable garments at a low figure.

It is a common belief that the coffee grain improves by age, but unless the coffee is kept in a *dry* place, the berry loses in strength and flavor. This, at least has been my own experience. A quantity of "Old Government Java Coffee" in its green state, became at the end of six or eight months entirely without flavor, although at the outset it was of first quality. It had been kept in a sack in a close closet, into which the sun never shown and which was consequently not fully dry. I mentioned the fact to various dealers as I had opportunity, and their unanimous reply was, "It was the dampness that *produced the mischief.*"

Have not all housekeepers of much experience learned that the *cheapest* sugar for all culinary purposes, is granulated sugar?—the cheapest for the table of the "hired help" as well as for cooking purposes. If not, try equal amounts in weight and observe the result. It will almost invariably be found that the granulated sugar lasts enough longer than the "coffee sugar" to compensate for the difference in price, while the convenience of the one over the other is not to be overlooked.

I now and then hear from house-keepers such pleasant reports of kerosene stoves—their convenience and economy, that it is rather surprising that they do not more generally come into use, especially in localities where the fuel of the farm has to be bought. For small families, or for use in hot weather, they seem to be particularly convenient and economical. It might lead to good results if such readers of the Rural as have them in use, would give their experiences, not omitting the cost of oil per hour.

I am sorry to see girls learning to operate the sewing machine, before having learned to use the needle dexterously. There is no art more necessary for a girl to be conversant with than that of being accomplished in the use of the needle—not only to sew well, but to repair garments neatly, to make a handsome button-hole, to sew on buttons, and to mend gloves. To be able to sew neatly by hand, is almost indispensable, and is an art only acquired by diligent practice, while to operate a machine, fairly, is a mechanical operation instead of an accomplishment. Mothers should see to it, that the fine art of needlework is not sacrificed to the fascination of the sewing machine.

In washing dishes supply yourself immediately after the meal is finished with a pitcher, or large-mouthed mug partly filled with hot water. In this, stand up all the silver spoons, forks and knives. The water should not be deep enough to reach the knife handles. Wipe, with a soft towel, after five or ten minutes. In this way, the silver escapes many a scratch, especially if left for the kitchen-maid to clean. It is a very small task for the mistress of the house to do, and saves her much vexation. A great annoyance in many households is the frequent breaking of the handles of coffee and teacups. Indeed the breakage became so alarming in my own, that I no longer allow those pieces to be passed to the kitchen, ordinarily, but have them wiped in the dining-room, and there is no more breakage. Half the breakage in dish-washing and in handling dishes, comes from the slovenly way in which they are gathered up. Everything is to be gained by placing the pieces that are alike together, and when this is done, and the silver, or steel-ware is disposed of as above suggested, half the work of putting the table service in order, is over. Wiping towels for glass-ware, is a specialty—a soft linen usually woven with cross-bars of color, and costing 12½ cents a yard. The soft Russia crash at the same price, is nice for dishes. Some housekeepers prefer wiping towels partly cotton. Worn-out bed-spreads, from their soft, close texture, make excellent dish towels. If you are so situated that the care of your dishes devolves upon hired help—not over-tidy are they sometimes—you can command a tolerable degree of cleanliness in dish cloths and towels, by having a full supply, so that the soiled may be taken daily from the kitchen and fresh ones put in their place. Such a method increases the size of the weekly wash, but I know of no better method by which to compass the slovenliness of the "hired girl" in regard to dish towels. Both cloths and towels should be well dried after use, as they rapidly rot from being continually wet or damp.

The Other Side.

Apropos of another side to the thrice-told story of A. E. S., p. 675, I will tell you of one reason why young men hesitate to wed. Mrs. A. was an old maid of 47; then she married A., 63, and a thrice-told widower. He was a hard-working plasterer, and adored his wife. I boarded with them. One night something was said about the kitchen floor. Mrs. A. remarked that she would get Mr. A. to scrub it when he should come home. And so she did; poor old man! Much other work his wife might do he also did at her command. We boarders thanked our stars that we were bachelors.

Jack.

Eating Radishes.

To those who are deprived of the satisfaction of eating radishes on account of poor teeth, I would say, grate them. If you have no grater you can easily make one out of any old piece of tin. Lay it on a soft board, punch holes in it with a sharp nail, and tack it, rough side up, on a shingle or small board.

Maggie Woolman Thomas.

DOMESTIC RECIPES.

Frothed Chocolate.

Put on to boil three pints of new milk. Wet three large tablepoonfuls of Baker's chocolate in a cup of hot water and pour into the boiling milk. Simmer 10 minutes stirring frequently. Then take from the fire sweeten and stir in the whites of two eggs beaten to a stiff froth. Put into a pitcher two or three whites of eggs beaten stiff and sweetened and pour over the top of each cup of chocolate before serving.

Excellent Rusk.

Make a thick batter of a quart of new milk, a half cup of good yeast and flour to thicken. When very light add a cup of butter rubbed to a cream, two cups of white sugar and three eggs well beaten, add flour to make a soft dough. Knead and set to rise for three or four hours, then make into biscuit and let stand until light and puffy. You may glaze just before you take from the oven with a little cream and sugar or the white of an egg, or make thin icing; flavor with lemon and brush over the rusk when cool.

Long Island.

Stewed Kidneys.

Three kidneys cut lengthwise each into three pieces, wash and wipe dry. Put into a frying-pan three tablespoonfuls of butter, a teaspoonful of minced onion, pepper and salt and a cup of good gravy. When this is hot put in the kidneys and cook slowly 20 minutes. Add the juice of a small lemon and a pinch of the grated rind. Take up the kidneys and lay upon a hot dish with toast underneath, thicken the gravy with browned flour, boil up and pour over all.

Mary B.

News of the Week.

HOME NEWS.

MONDAY, Oct. 17, 1881.

BAD MANAGEMENT AT YORKTOWN.—The authorities having the Yorktown celebration in hand have made a grievous blunder in not providing proper, or in fact sufficient, places for the entertainment of the guests on the great occasion. Their most eminent success, according to reliable information, has been attained in leaving undone things which might have been done in good season, and there is a probability that many will return to their homes at an early date with their patriotic ardor somewhat cooled. There is little excuse for any neglect in these preparations, as an immense crowd was expected, and the blunder about quarters for our French guests is without sufficient reason. The old Moore house, where the articles of capitulation were signed, has been renovated and partially rebuilt, but it will not accommodate one-half the visiting Frenchmen, who did not come here to be packed away nights, like herrings in a box. Unless private enterprise comes to the rescue there is a likelihood that the French officials and others from "over the sea," will go home again with no exalted views of American hospitality. Barns, sheds and houses on land, and barges, old vessels, etc., on water, are being fixed up with bunks and their floors covered with mattrasses for sleeping accommodations, and as for eating, people must catch a bite where they can, or do as they would at a pic-nic—take a lunch with them. But then, we suppose they wish the recollections of the Peninsular campaign to be as vivid as possible!

THE PROPOSED WORLD'S FAIR AT BOSTON.—Several months ago a committee of 28 was appointed to consider the feasibility of holding a world's fair at Boston. On the 13th inst. that committee met and rendered its report. While the general opinion seems to be favorable to such a project, there is some doubt as to how far this sentiment may be relied on for substantial aid until the project has assumed some definite form as to capital, time and location. Beacon Park has been offered for the purpose free of rental, and this has encouraged the committee somewhat in their efforts; but the main thing is to secure a guaranteed capital of not less than $5,000,000, and if this can be done the committee recommend the holding of the fair. Besides the general public interest, several prominent citizens must devote a large share of their time to the work and a simple business organization must be formed under a special charter of the State, to be "broadened in its scope and materialized by concurrent resolution of Congress." While all this is possible, we do not now look upon it as probable.

SPECIAL SESSION.—On the 10th inst. the Senate met in special session. Senator Bayard (dem.) of Delaware was elected President of the Senate *pro tem*, which constituted him Vice-President of the United States. On the 11th, Miller and Lapham of New York, who succeeded Conkling and Platt, and Aldrich of Rhode Island who succeeds the late Senator Burnside, were duly sworn into office and took their seats. On the 12th the Republican Senators met in caucus and decided to present the name of Senator David Davis, of Illinois, for President *pro tem*. On the 13th, Senator Logan, of Illinois, offered a resolution to elect his colleague, Davis, President *pro tem.*, and on being put to vote the resolution was carried 36 to 34, Messrs. Bayard and Davis not voting. Senator Anthony, a previous candidate for the position, and Senator Bayard, the deposed President, were appointed by Senator Harris, temporary chairman, to escort Mr. Davis to the chair.

Guiteau, the assassin, was brought into court on the 14th inst. and indicted. His plea is "not guilty." His lawyer, Mr. Scoville, said the defence would mainly consist of two points—first, insanity; second, the wound was not necessarily mortal. The trial is put down for November 7 next.

Wyatt Henry Cardwell, a grandson of the Revolutionary orator, Patrick Henry, turned up as a vagrant at the Memphis police headquarters a few days ago. He possesses a fine education, but is unable to stand against rum.

The election in Ohio, held on the 11th inst., resulted in favor of the Republicans, by a plurality of 25,000 for Foster, their candidate for Governor. In Iowa the Republican majority is estimated at 48,000.

The Democratic Convention at Albany last week made the following nominations:—For Judge of the Court of Appeals, A. Schoonmaker, Jr., of Ulster; for Attorney General, Roswell A. Parmenter, of Rensselaer; for Secretary of State, Henry Purcell, of Monroe; for Comptroller, George N. Lapham, of Yates; for State Treasurer, Robert A. Maxwell, of Genesee; for State Engineer, Thomas Evershed, of Orleans. A new State Committee was appointed, of which Daniel Manning was elected chairman. The Tammany men, before leaving Albany, drew up an address protesting against their exclusion from the State Democratic organization.

Hannibal Hamlin, of Maine, has been appointed Minister to Spain; Walker Blaine, the Secretary's son, has been appointed Third Assistant Secretary of State, and Mark S. Brewer, of Michigan, Consul-General to Berlin.

Dr. J. G. Holland, editor, poet and novelist, died in this city on the 12th inst. of heart disease. He was born at Belchertown, Mass., July 24, 1819. Since 1870 he has been editor of Scribner's Monthly, now the Century Magazine.

The descendants of Baron Steuben who were invited to attend the Yorktown celebration arrived in this city on the 13th inst. There are seven in the party. They were received with honors by Government representatives and others.

A fire in the Fourth Avenue Horse-car stables and vicinity destroyed about $1,500,000 worth of property on Monday night. Over 300 horses are now reported killed. Morrell's store-house was consumed, in which much valuable property was stored, such as paintings, books, furniture, etc. Humphrey Moore loses an oil painting valued at $20,000, and some 500 other paintings, sketches, etc. Cornelius Vanderbilt lost a library of choice books worth $15,000, one volume—a copy of Audubon's Ornithology—costing $12,000. His son lost a rare painting valued at $55,000. Mme. Pauline Fischers, the well-known prima donna, lost a valuable library of 800 volumes and 65 opera scores. The exact amount of losses and insurance cannot yet be ascertained.

The Cincinnati Industrial Exposition, after having been open to the public for 31 days, is closed. The treasurer's books show that the expenditures have exceeded the receipts by about $15,000.

The United States Trust Company, of New York, has had registered at the Treasury Department $275,000 in 4 per cent. bonds in the name of the company as "Trustees of Mrs. Lucretia R. Garfield and the surviving children of James A. Garfield, deceased," being the amount purchased with the proceeds of subscriptions to the Garfield fund. These bonds will yield an annual income of $11,000, and cannot be paid off by the Government until the year 1907.

The case of the men who robbed the passenger train on the Iron Mountain Railroad on the night of September 2, and who were pursued and finally captured on September 28—one in Texas and two in the Indian Nation—and brought to Washington, assumed a new and sensational phase in the Special Term Court, when each of the robbers pleaded guilty to 14 indictments, making the term of punishment 70 years for each man.

Charles P. Thompson, of Gloucester, has been nominated for Governor of Massachusetts by the Democrats of that State.

Theodore Stock, a miser, who lived in Toledo, Ohio, died in a fit in his cabin. He left a quarter of a million to one of two children. He subsisted on the refuse of hotels, and made a portion of his fortune by burying the victims of cholera.

The total earnings at Sing Sing prison for fiscal year ending September 30, 1881, are $228,254.14; total expenditures, $187,127.20, leaving a net profit for the year of $42,126.94.

The army retired list is limited to 400. There are at present only seven vacancies, while fifty officers are eligible to retirement.

The commissioner of patents reports 13,000 original patents issued the first nine months of the present year, an increase of 2,300 over last year. The receipts were $65,000 in excess of those for the corresponding period last year. The report recommends a considerable increase in the crop examining and clerical force, and calls for an appropriation of $94,000.

Guiteau in his autobiography traces all his misfortunes and failures in life to his early training, and is especially severe on his father, to whom he attributes most of his calamities and ill success. He shows how he persistently followed the late President with the intent to assassinate him, and re-affirms that he believed he was acting under special Divine authority. He denies any legal liability, and says that for twenty years he has had an idea that he would President.

After several months inquiry the Committee of Twenty-eight appointed to consider the feasibility of holding a world's fair in Boston met on the 13th. They reported that to successfully inaugurate and forward the project it would be necessary to secure a guaranteed capital of $5,000,000, and that it was doubtful if that sum could be raised, unless private subscriptions were supplemented by State and city aid, which could not properly be expected.

The Albany new City Hall corner-stone was laid on Thursday with Masonic ceremonies, which were witnessed by a large concourse of citizens. The box which was deposited at the laying of the corner-stone of the old City Hall in 1823 was opened and the contents noted. It was then, together with a new box and new contents, deposited with the new corner-stone.

Garfield's picture will be placed upon the five cent international postal letter stamps.

The Rev. John A. Lansing of Brookline, Mass., who was jointly indicted here with Miss M. Ward, of Waverly, N. J., for obtaining $14,000 worth of bank shares from Mrs. P. C. Upham, widow of the late Professor Upham, of Bowdoin College, by false pretenses, has been released from prison, Mr. A. V. Stout, of the Shoe and Leather Bank, becoming his bondsman in the sum of $3,500.

The Detroit Post and Tribune furnishes a careful approximation of the losses by the recent farm and forest fires in Ottawa, Allegan, Manistee, Huron and Sanilac counties, Michigan. The total is $2,346,413. There were 1,147 dwellings burned, 28 school houses, 8 churches, 12 hotels, 130 stores, 34 mills and 20 docks. The insurance on all this was only $628,632—so that an absolute deficiency of $1,722,781 remains to be met. What should be done is to see that their immediate and most pressing wants are provided for. To do this, even on the most limited scale, will require at least $600,000 and probably $1,000,000. But the total of the contributions from all sources is now about $300,000.

"Simply Wonderful."

The following is an extract from a letter received July 6th, 1880, from which it will be seen that Compound Oxygen did a work which, to use the author's own language, is "simply wonderful!" He says: "Since I wrote you last (about five weeks ago) I have gained fourteen pounds in weight, and my general health has improved accordingly. I have just finished the Treatment which you sent April 12th, and the work which it has done is simply wonderful. I did not tell you before that my physician had just given me up. Such was the case. Six weeks ago I was so weak that I could barely walk across the floor. The other day I walked three miles." Our Treatise on Compound Oxygen containing large reports of cases, and full information, *sent free*. Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.—*Adv.*

AGRICULTURAL NEWS.

MONDAY, Oct. 17, 1881.

THE following items of agricult ral news have been condensed from telegrams received here from Friday noon to date: Portland, Me.—Produce market firm and very active at higher prices. Farmers paying their debts well.....

Philadelphia, Pa.—Wool firm; but trade only moderate. Western consignors holding off for better prices. Goat-skins scarce and prices slightly advanced. Leaf and plug tobacco within the past 60 days, has advanced 15 per cent., while in smoking tobacco there has been no appreciable change. Wheat lower and unsettled.....

Detroit, Mich.—Grain trade restricted by lack of storing capacity. Holders threatened with extra storage charges unless the elevators are promptly relieved. Corn, oats and clover seed, dull and lower. Provisions comparatively scarce and low. Potatoes and butter are abundant and prices a trifle lower. Wheat firm. No. 1 white $1.36⅞ cast. No. 2 red, $1.40½.....Chicago, Ill.—Grain and provisions weak and unsettled for a week. October corn sold on Friday as low as 59⅝c, and November 60c—a decline of 16c in 10 days. Wheat sold at $1.30—a decline of 15c in the same time, and in the same interval pork has dropped $2.50 per barrel. Prices, however, have probably touched bottom. There are now ten million bushels of corn in the elevators and still receipts are heavier than shipments.....Peoria, Ill.: It has rained steadily during the week. Laborers are demanding higher wages and usually get them. .....Cleveland, Ohio: Grain market weak and unsteady: No. 2 red Winter wheat, $1.41; shelled corn, 60@71c.; new in cars, 65c.; oats firm at 40c. for No. 1. Weather rainy and unfavorable to dairy interests.....Columbus, Ohio: Crops excellent hereabouts..... Evansville, Ind.: The tobacco crop hereabouts is not damaged so much as was reported. Much of it is still in the fields and looks fine; but, owing to swift growth after the rain, it is thought it will cure dark.....Milwaukee, Wis.: Rain falling nearly every day has delayed delivery of grain and other produce from interior points. An enormous amount of business in grain has been done from day to day, however, with violent fluctuations in prices. The general feeling is bearish, heavy sales resulting in a decline of nearly 10c. a bushel in wheat. Mills generally well up with their contracts, and if they continue running, flour will be lower.....

Minneapolis, Minn.—Another week of rain Fall plowing behind. A good deal of wheat thrashed this week in all the Northwest. Millers buying 100,000 bushels daily. Market closed weak at $1.33. Of flour 85,000 bushels shipped during the week. Some discouragement among small farmers owing to poor crops.....Louisville, Ky.—Grain markets all lower; distillers buying corn therefore liberally. Leaf tobacco unimproved; burley only in good demand.....St. Louis, Mo.—Cotton steady with some improvements in futures; receipts since Aug. 31, 50,086 bales—50 per cent. more than at the same time last year. Wheat on the down grade; market demoralized and unsettled. Corn, ditto. Provisions declining. Live stock average receipts; good steers at firm figures; thin, in liberal supply and low. Freight blockade at East St. Louis owing to unusually large shipments and "pinkeye" disabling transfer horses. River Convention now assembling—an important gathering. Kansas City, Mo.—Cattle market firm and active. Hogs weak, and prices 10c@15c lower; best grades now selling for $6@$6.25.....Omaha, Neb.—Weather for the week rainy and gloomy. Orders for goods pouring in from the country, however. Produce scarce and dealers are buying heavily through the country, paying high prices. Large shipments of cattle are being received, and grain receipts are increasing. Porkers are bringing $6.50.....Denver, Col.—Hog market quiet, receipts small, but supply ample. Fruit very active, a brisk demand for apples. Colorado ranch produce is crowding the market. Hides dull. Deer and antelope skins abundant; prices fair..... Baltimore, Md.—A slight advance in the cattle market and prime heavy are in demand. A heavy falling in the breadstuff market owing to moderate purchases. Market for Western wheat was excited, and one day's sales amounted to 714,000 bushels. Southern wheat dull and weak; Fultz, $1.35@$1.40, and Longberry, $1.45@$1.53. Corn easier and prices for Southern and Western lower. Better grades of butter in demand and firm. Oleomargarine finds ready sale at 20c@22c, solid packed, 21c@23c rolls, and 23c@25c prints. Cheese market active, commanding strongest prices.....Richmond, Va.—Tobacco market firm owing to dry weather; "brights" higher, and it is thought they will continue to advance.....Wilmington, N. C.—Provision trade brisk. Cotton receipts increasing. The rice crop falls short..... Charleston, S. C.—Rice crop estimated fully 24 per cent short of last year's crop, prime selling at 8c.....Savannah, Ga.—Long, dry spell. No frost yet. Cotton quiet but firm.....Atlanta, Ga.—Cotton coming in freely, though farmers are holding for higher prices. Crop will soon be gathered. Weather still favorable for picking.....Augusta, Ga.—Grain and provisions lower; supply light. Cotton coming in rapidly. In some localities the plant is still growing and fruiting. Unless the Fall is unusually late, but little of the new crop will mature.....

In many parts of the West and especially in Illinois there are grievous complaints of injury of a very unusual nature to the corn crop. It seems that owing to the unprecedented drought during the past Summer and the late heavy warm rains the corn on the cob has in many cases sprouted, as if it were in the ground, while in other cases the butts of the ears have rotted. Fields of corn which to the eye appear capable of yielding from 35 to 45 bushels of merchantable corn per acre, will, it is said, owing to this cause give a much smaller yield. The damage is variously estimated at a loss of from 10 to 30 per cent. of the crop in different places. It appears to make little difference whether the stalks are standing upright or whether they have been bent over until the tips of the ears touch the ground.....

New Orleans, La., Weather still warm with occasional showers favorable for cane and cotton. Cotton market firm with an upward tendency. Rice steady and in active demand .....Nashville, Tenn.: Wheat and flour firm and in good demand. Milling wheat worth $1.55@1.59. Fine Fall weather after the severe drought has given us a splendid growth of grass. Cotton receipts good; sales slow. Montreal, Canada: Wool firmer and in active inquiry from manufacturers. Cattle trade dull; grain trade heavy.....J. H. Sanders, editor-in-chief of the Chicago National Live Stock Journal, Chicago, has retired from that paper and will begin the publication of a weekly to be called the Breeder's Journal.

From the reports made at the Annual Convention of the National Farmers' Alliance held the other day at Chicago, it appears that already 1,000 Alliances have been organized with a membership of 24,500. These Alliances are distributed as follows:—Nebraska, 291; Kansas, 245; Iowa, 150; New York, 60; Wisconsin; 51; Minnesota, 50; Illinois, 45; Michigan, 19; Missouri, 19; Indiana, 10. Each member is to pay 10c. towards the support of the alli-

ence. The officers elected for the following year are: John D. James of Kansas, President; Hon. Matt. Anderson, of Wisconsin, Vice-President; D. W. Wood, of Illinois, Secretary; Allen Root, of Nebraska, Treasurer. Resolutions were adopted in favor of equal taxation; a just income tax; moderate salaries for government officers, and civil service reform; the abolition of free railroad passes to legislators and other public officials; Congressional legislation on interstate traffic; public agitation against railroad monopolies and exactions; a change in the patent laws exempting users of patented articles from liability for royalty; the establishment of a uniform royalty on all pateuts on payment of which any one can make the goods; penal legislation against food adulteration; the nomination of all elective officers by the direct vote of members of the organization instead of by conveutions.

COMMISSIONER Loring is arranging for an eight days' conference of the leading agriculturists of the country to be held in Washington at the rooms of the Department of Agriculture, opening on January 10, 1882. It is proposed to secure the presence of representatives of State Boards of Agriculture, agricultural journals and agricultural colleges as well as leading farmers and stock breeders and all others especially interested in agricultural affairs. The first two days will be devoted to agricultural colleges and societies and the discussion of the general principles of farming, and of questions relating to agricultural education. The next two days will be occupied by the consideration of the various modes of breeding, feeding and handling cattle, horses, sheep and swine, their sanitary condition, and the questions of transportation, exportation, etc. January 14 and 15 will be devoted to discussion of all matters relating to cereal crops, and during the two following days the management of vineyards and the manufacture of wine will receive full consideration.....

THE annual convention of Short-horn breeders is to meet at Jacksonville, Illinois, on October 26 and 27. It is believed that a change in the organization will be effected in the way of rendering it more aggressive, and with this object in view an effort will be made to elect young and enterprising men as officers. From all accounts, there seems to have been a great lack of enterprise and push among Short-horn men of late, all the more noticeable in face of the energy with which rival breeds of cattle are being brought to the favorable notice of the public.....

It would be supposed from its popularity that only one substance is now known to the world for the relief of rheumatism, and that is St. Jacobs Oil.—St. Louis (Mo.) Dispatch.

Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., is rapidly acquiring an enviable reputation for the surprising cures which daily result from the use of her Vegetable Compound in all female diseases. Send to her for pamphlets.

What ails you.

Is it a disordered liver giving you a yellow skin or costive bowels; or do your kidneys refuse to perform their functions? If so take a few doses of Kidney-Wort and nature will restore each organ ready for duty.—Star.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is enough. Price 25 and 60 cents per box.

Garfield and Family—elegant engraving 19 by 24—sent for 24c. (stamps). Sheehy & Co., 33 Barclay St., N. Y.

Premature Loss of the Hair.

May be entirely prevented by the use of BURNETT'S COCOAINE.

THE superiority of BURNETT'S FLAVORING EXTRACTS consists in their perfect purity and strength.

The Markets.

SPECIALS FROM THE CHIEF CENTERS

Until Saturday, October 15.

CHICAGO.—WHEAT active, firm and higher; No. 2 red Winter at $1.34@1 35; No. 2 Chicago Spring, $1.34¼@1.34½ cash; $1.34½ October; $1.35⅝@1.34¾ November; $1.37¼ December; $1.34@1.34¼ all the year. CORN active, firm and higher at 60¾c., cash and October; 61¾@61½c., November: 63¼@63⅜c. December; 69c. May. OATS moderately active and higher at 43¾c., cash; 43½@43¾c. October; 43¾c. November; 44½@44⅝c, December; 47⅝c. May. BARLEY stronger at $1.04½. FLAXSEED stronger and higher at $1.44@1.48. PORK strong and higher at $17.50 cash; $17.25@17.30 October and November; $17.45@17.50 December; $18.57½@18.60, January. Lard active, firm and higher at $11.77½@11.80 cash, October and November; $11.95@12 December; $12.15@12.17½ May. HOGS—market active and stronger, with a good demand; mixed packing, $5.75@6.50; choice heavy, $6.60@7.30; grassers and rough, $4.70@5.50; light $6@6.45; culls, $3@5.50. CATTLE—receipts for the week 43,000 head—the largest on record; market weak and lower on poor stock; choice fat; $6.40@6.60; fair to good, $5.25@6; common to medium, $4@5; butchers', $2.30@4; stockers and feeders, $2.90@4.20; range cattle, 10@15c. lower; through grass Texans, $2.95@3.65; half breeds and natives, $3.90@4.65. SHEEP—fair to choice, $4.40.@5; common to medium weak and dull at $3@4.

ST. LOUIS.—WHEAT—No. 2 red Fall, $1.45 cash; $1.48⅝ November; $1.51⅛ December; $1.54⅛ January; No. 3 do. $1.36; No. 4 do. $1.27. CORN, higher but unsettled at 62½c. cash; 64⅝c. November; 67¾c. December; 69⅛c. January; 73½c. May. OATS higher at 44@45⅜c. November; 47¼c. December; 49c. January. RYE better, $1.06½. CATTLE—Supply wholly of grass Texans, which are strong; good to choice, $3.25@4; common to fair, $2.50@3; good to choice native shippers' steers, $5.75@6.40; exporters, $6.50@7. SHEEP—demand good for all grades above common; fair to good, $3.50@4.25; choice to fancy, $4.50@5. HOGS firmer on light receipts; Yorkers, $6.20@6.25; packing, $6@6.50; butchers' to fancy, $6.60@7; pigs, $5.50@5.60.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Oct. 15, 1881.

BEANS AND PEAS.—Export and other large buyers begin to meet the strong figures that prevail for beans and the market closes better than at our last for all new grades. Old reds, $2.60@3. Southern B. E. peas are in stock and down to $3 ₱ 2-bush. bag.

Marrow beans, new, $3.60; mediums, $3.55; pea, $3.55; white kidney, $3.60; black or turtle soup, $2; red kidney, new, $3.15@3.25.

Receipts of beans for the week, 20,600 bush.

Exports do. 613 bush.

BUTTER.—There is a weakish tone to the market for all but fine grades, and these are showing forced rates in consequence of the scarcity of fancy. The fact is, butter seems to have lost its boom along with several other items of produce, and prices are up to a point that keeps the general stock large. In the opinion of the trade the next turn in prices will be in buyers' favor. Exporters seem to have deserted the market, and reports from abroad do not show a want of anything that can be sent out profitably. We repeat quotations:—

Creamery, finest tubs, 36@37c.; good to prime, 32@34c.; other quality, 24@26c.; sweet cream, 29@31c.; State dairies do. 23@28c.; do. half tubs, choice, 30@31c.; do. fair to prime, 25@29c.; Welsh tubs, 25@30c.; poor State, 20@25c.; Western imitation creamery, 20@30c.; do. dairy, choice, 26@27c.; other, 17@23c.; factory or ladle-packed June and Iowa, 18@19c.; other, 15@17½c.; common Western, 15c.

Receipts for the week, 34,155 pkgs.

Exports do. 2,962 do.

Cold storage to G. B., 908.

CHEESE.—The lull of the past few weeks has had no important variation. Prices for fine factory hold nominally as before. Exporters act as though they are in want of fine goods but not at current figures. The cable is too low for their safety and the quality of the bulk of the supply is not as attractive as it should be at this advanced part of the season. Sellers, however, maintain a still tone for any parcels of fine rating stock, but are anxious to move the sharp Julys and Augusts. Western cheese are running poor.

State factory, fine, 12¾@13c.; good to prime, 11¾@12c.; fair to good, 10¾@11¾c.; poor to fair, 9¾@10¾c.; Ohio factory, flat, fine mild, 12¾@12¾c.; good to prime, 11@11¾c.; fair to good, 10@11c.; creamery, partly skimmed, choice, 10@11c.; poor to good, 4@9c.; fully skimmed, 2@3c.; full skimmed factory, 1@3c.

Receipts for the week, 39,478 pkgs.

Exports do. 13,797 do.

Liverpool cable, 58s.

Steam to Liverpool, 12s. 6d.@17s.

COTTON.—A steadier tone prevails, as crop accounts do not promise to materially cheapen stock. The trade has now a more settled information as to the yield; the accepted estimate is 5,750,000 bales. This is is below last year's growth, but somewhat above early estimates.

CURRENT PRICES.

Quotations based on American standard of classification.

	Uplands.	N. Orleans and Gulf.	Texas.

Receipts for week, 15,312 bales.

Exports do. 21,200 do.

DRIED FRUITS.—There is no important movement but the general tone especially for apples is steady. All holders look confidently to a future support of at least annexed prices.

Apples, evaporated, new, 11@13c.; do. old, rings, choice, 13c.; do. fair to prime, 11@12c.; N. C. new, sliced, extra fancy, 8½@9c.; choice, 7½@8c.; fair to good, 6½@7c.; Southern, new quarters, choice, 6@7c.; fair to prime, 5¾@6c.; inferior, 5@5½c.; State, old, fine-cut, choice, 6½@7c.; quarters, do. 6¾@6¾c.; small lots, 6½c.; Ohio and Mich, choice, 6@6½c.; Western, fair to good, 5¾@6c. Peaches, evaporated, peeled, 1880, 33c.; unpeeled, 26c.; N. C. peeled, new, fancy, 23@24c.; choice, 22@23c.; Ga. peeled, choice, 22@23c.; Southern, peeled, fair to good, 18@20c.; unpeeled halves, N. C. 9c.; halves, Tenn. 8½@8¾c. Plums, State, black, 17c.; Southern Damson, 15@15½c. Blackberries, 13@13½c. Cherries, Southern, dry, 19@20c. Raspberries, 28c. Huckleberries, 15½c.

EGGS.—Receipts for the week, 8,839 bbls.; do. last week 6,769 do. The demand has run steady and the presence of limed has not had a cheapening impression upon fresh. All stock brings prompt prices and general quality favors trade.

Near points, 27@28c.; State and Pa. 25½@26c.; Canadian, 24@24½c.; Western, 24@24½c., under grades 22@23c.; limed State 21@22c.; Western, 20@21c.

FEATHERS.—There only small sales, but holders remain firm at 62@65c. for white live geese and 25@40c. for mixed.

FLOUR.—With the decline in wheat flour has had a lower tendency daily showing in a decline of 5@10c. ₱ bbl. per day in standard grades.

No. 2, $4.00@4.00; State and Western, superfine, $5.35@5.85; city mills, extra, $7.25@7.50; Spring wheat, extra, $6.30@6.65; Spring XX and XXX, $6.75@7.75; patents, $8@9.50; Ohio round hoop shipping, $6.50@6.90; trade brands, $7.00@7.50; St. Louis extra, $6.65@7.00; do. double extra, $7.75@7.75; do. family, $8@8.25; Southern extra shipping, $6.85@7.25; do. XX and family, $7.50@8.25. Rye flour, superfine, $5.70@6.10; buckwheat flour ₱ 100 lbs. $3.80@4.10. Corn-meal, Brandywine, $3.85@3.90; do. Western, $3.40@3.85.

Receipts of flour for the week, 106,480 bbls.; corn-meal 4,790 do.

Exports of flour for the week, 35,893 bbls.; corn-meal 1,948 do.

FRESH FRUITS.—Exports of apples 3,000 bbls. Choice fruits of all kinds doing well.

Apples, Baldwin, State, ₱ bbl. $3@3.25; Jersey, $2.75@3.00; Greening, State, $2.75@3.12; N. Spy, do. $3@3.25; Fall apples, do. red varieties, $3.25@3.50; State, green, $2.75@3.25. Pears, Sheldon, Western N. Y. ₱ bbl. $4.50@6.50; Beurre Bosc, $5.50@7.50; Duchess, $4@5.50; Virgalieu, $5@7; Beurre d'Anjou, $5@7; Seekle, choice, $8@9; fair to good, $6@7; ₱ keg, $3@4.50; Vicar of Wakefield, ₱ bbl. $3.50@4.50; cooking, $2.50@3. Peaches, NewJersey and up-river choice ₱ bskt. $1.75@2.75; prime, $1.25@1.50; fair $1@1.25; culls, 75@80c. Quinces, apple, prime ₱ bbl. $1@6. Grapes, Del., State, case of 18 3-lb bxs, $5@5.50; bskts, choice, ₱ lb, 11@11c.; poor to fair, 8@9c.; Catawba case of 18 3-lb bxs, $3.25@3.50; State, bskts, ₱ lb, 6@7c.; Concord, case 18 3-lb bxs, $2@2.25; do. in bskt, ₱ lb, 3@4c.; up-river, loose, ₱ lb, 2½@3½c.; Isabella, State bskts, 3@3½c. Cranberries, Cape Cod, choice, ₱ bbl. $8.50@9; fair to prime, $7.50@8; do. poor to fair, $5.50@7; ₱ crate, $2.50@3; Jersey, prime, ₱ crate, $2.00@2.25; fair to good, $1.50@1.75; do. poor to fair, $1.25@1.50.

GRAIN.—Confidence does not seem to be in any way restored in wheat. Quotations have not yet reached an exporting point, though supplies at the seaboard have a depressing effect. Corn and oats participate in the tame feeling that predominates at the close.

Wheat, Spring, $1.39@1.42; Spring No. 2, $1.37@1.40; red Winter No. 2, $1.43½@1.47½; red Winter, $1.35@1.51; white Western and State, $1.37@1.50. Rye, $1.03@1.07. Oats, white No. 1, 51@55c.; No. 2, 53@53½c.; No. 3, 51c. mixed, No. 1, 48c.; No. 2, 46½@47½c.; No. 3, 42@44c. Corn, Western mixed, nominal, 70c.; No. 2, 69½@70c.; yellow, 70@73c.; white, 72@76c. Barley, Canada, No. 1, $1.05@1.10; do. bright, $1.10@1.12; State 4-rowed, 95c.@$1.02½. Buckwheat, 90@95c.

Receipts for the week, wheat, 645,015 bush.; corn, 1,007,966 do.; oats, 113,224 do.; rye, 25,386 do.; malt, 6,450 do.; barley, 136,900 do.

Exports for the week, wheat, 430,914 bush.; corn, 614,882 do.; oats, 1,950 do.

The visible supply of grain, comprising the stocks in granary at the principal points of accumulation at lake and Atlantic ports, and on rail, on lakes, on canal and on Mississippi River:

	1881. Oct. 8. bush.	1880. Oct. 9. bush.	1879. Oct. 11. bush.
Wheat	20,109,817	14,494,852	20,787,411
Corn	28,120,876	19,934,221	11,037,559
Oats	5,759,915	3,447,268	2,705,182
Barley	1,922,209	2,177,379	2,063,042
Rye	1,052,599	702,295	764,511
Total	57,025,546	40,743,168	37,356,705

HAY AND STRAW.—Receipts of hay are lighter, but there was quite accumulation in store and former prices are very little varied. Shipping shows the strongest prices. Straw has advanced a trifle; demand good for long rye.

Prime Timothy hay, ₱ 100 lbs., $1.05@1.10; medium Timothy, 80@95c.; shipping grades, 65@70c.; clover mixed, 70@75c.; clover, 60@65 c.; Straw, long rye, 75@80c.; short rye, 50@55c. oat and wheat straw, 40@45c.

Exports of hay for the week, 1,865 bales.

HONEY—Arrivals are large and prices are weakening. Offering at 16@18c. white clover comb choice; 15@16c. fair to good; 12@13c. buckwheat.

HOPS.—The market is firm and higher; brewers have appeared for stock and grumble at the sudden sharp advance. Exporters are not doing much here, but they are sending a good many from the interior and any reduction of visible supply strengthens the feeling.

Crop of 1881, choice, 29@32c.; good to prime, 26@27c.; fair to good 22@24c.; 1880, choice, 20@23c.; fair to prime, 14@18c.; poor to fair, 10@14c.; eastern, new 22@28c.; 1879 fair to prime, 10@15c.

Receipts for week, 7,088 bales.

Exports for the week, 2,098 do.

MILK.—Prices have made a good average for commission milk, $3.30 ₱ can of 40 quarts, but the fluctuation has been wide ranging $1.75@5 per can. The tone of the market is easy as milk arrives in larger sweet supply now that the weather is cool.

POULTRY AND GAME.—There is a fair demand for prime dressed. General quality especially lots from a distance run uneven.

Turkeys, Phila. prime, 15@17c.; State and Western dry-picked, 14@15c.; scalded, 13@15c. Chickens, Phila. spring, 18@20c.; Bucks Co. do. 17@18c.; Jersey, do. 16@17c.; State, do. 14@15c.; Western, do. 13@14c. Fowls, Phila. dry-picked, 16@—c.; Bucks Co. 15@16c.; Jersey, dry-picked, prime, 14@15c.; do. scalded, 14@15c.; State and Western, dry-picked, prime, 13@14c; scalded, prime, 12@13c.; inferior, 10@11c. Ducks, Spring, Phila, ₱ lb, 17@19c.; Jersey and Bucks Co. 15@16c.; State, 13@15c.; old, fair to good, 10@12½c. Geese, Phila. dry picked, young, 14@16c.; do. old, 11@12c.; Western, old 8@10c. Squabs, white, ₱ doz. $2.50; dark, $1.50@1.75.

Liberal supplies of live have kept down prices. At the close the quantity offering is large and the demand from killers slack. A few sales of single coops to the grocery trade are reported a shade above our quotations. Turkeys are not over plenty and good lots are in demand; some lots of poor thin sold at 10@12c. Ducks and geese rule about steady.

Chickens, Jersey, spring ₱ lb. 12@12½c.; State and Penn. 11½@12c.; Western, and Southern, 10@10½c.; Fowls, Jersey, State & Penn. 11½@12c.; Western and South'n, 10@10½c. Roosters, old, 5@6c. Turkeys, Jersey and Penn. 12@14c.; Western, 10@13c.; Ducks, Jersey, extra-large, ₱ pair, $1@1.25; Jersey, New York and Penn. 70@75c.; Western, 50@60c.; Southern, 50@55c. Geese, Jersey, per pair $1.30@1.62; N. Y. and Penn. $1.25@1.50; Western mixed $1@$1.25; Southern, 75c@$1. Pigeons, large, strong birds, 30@35c.; young, 25@30c.

Western game is in large supply and prices are drooping; wild ducks firm at 75c. for redhead and mallard, 50c. for teal and 40c. for common ₱ pair. Reed birds are quoted at $1@1.25 and blackbirds 20@30c.

Grouse, choice, $1.12@1.25; soft, 50@75c.; partridges, prime, $1.25; eastern, $1; soft, 50@75c.; woodcock, choice $1; inferior 50@75c.; English snipe fresh-killed, $1.50@1.75; plover, do. $1.50@1.75; venison, Minn. short saddles, 19@20c.; Western, 17@18c.

Venison scarce and wanted. Shippers should avoid cutting saddles too short. Buyers want the loin, and about three ribs should be left on.

PROVISIONS.—The exports of hog products are light and speculation has lost its animation. At this season of the year there is apt to be some manipulation on the part of packers in effect to secure hogs at the most favorable rates. The undertone of the market, however, indicates an early revival of strong prices. Tierce beef has advanced with stock bought up largely for this and next month, and barreled beef has strong sympathy.

Pork, extra prime, ₱ bbl. $14@14.50; Western mess new, $18.50@19.25. Lard, steam Western, ₱ 100 lbs., $12@12.05; prime city, $11.90@11.95. Hams, smoked city, ₱ lb. 13@14c.; pickled Western and city, 12@12½c.; Shoulders, smoked city, 8¾@9.; pickled, 8@8¼c. Rib bellies, pickled, 10@10½c. Bacon, long clear Western 9½@9¾c. Beef, Western mess, ₱ bbl. $12@13; packet $13@14; India mess, ₱ tce. $22.00@25.00. Beef hams, ₱ bbl., $20@21.

Receipts for the week—Beef, bbls. and tcs. 885, pork, bbls. 2,850; cut-meats, pkgs 22,121; lard, do. 16,895.

Exports for the week—Beef, bbls. and tcs. 2,191; pork bbls. 2,372; cut-meats, lbs. 3,578,628; lard do. 4,449,162.

SEEDS.—Clover has sold in car lots as low as 9c., but holders are a little firmer at the close and have refused that price. Selected seed suitable for export has sold at 9½@9¾c. Shipping inquiry moderate. Timothy quiet.

Clover, Western, 1881, car lots on track, 9c.; Timothy, job lots in store, $2.85@3.25; flax-seed, American rough, ₱ bush. $1.45@1.50

TOBACCO.—Is without quotable change.

VEGETABLES.—Fine lots of potatoes are scarce and prices again favor sellers. The average quality of State is not prime.

Potatoes—Early Rose, Eastern, ₱ bbl., $3.12@3.25; L. I. bulk, $3.25@3.37; State, $2.75@3; Prolific, Eastern, $2.75@3; Snowflake, State, $2.75@3; Burbank, State, $2.75@3; do. L. I. $3.25@3.37; Peerless, State, $2.50@2.75; sweet potatoes, Va. yellow, $1.75@3; Del. River, $2.00@2.50; Jersey, $2@2.25. Bulk potatoes 275 lbs. to bbl.

In garden truck the feeling is generally firm; cool weather directs more trade to the coarser kinds.

Sweet corn, ₱ 100, 75c.@$1.50; egg plant, $5; tomatoes, ₱ bush., 50@75c.; squash, Marrow, ₱ bbl., $1.50@1.75; Hubbard, $1.75@2; cabbage, ₱ 100, $7@9; beets L. I. ₱ bbl. $1.25@1.75; white onions, bulk, $3@3.25; yellow, $2.50@2.75; red, Eastern, $2.25@2.50; red Chester, $2.25@2.50; frosted, $1.75@2; carrots, $1.25@1.75; turnips, Russia, $2.50@3; cauliflower, $1@5; pumpkins, ₱ 100, $1@7.

Exports of potatoes for week, 3,908 bbls.

WOOL.—Quiet and held at unchanged prices. Buyers have filled up quite liberally and the trade is now more of a style to keep up assortments than of a real wholesale character.

LIVE STOCK MARKETS.

NEW YORK, Saturday, Oct. 15, 1881.

BEEVES.—Receipts for the week, 16,145 head; do. last week, 14,829 do. The early part of the week was attended with a large offering and remarkably large sales. Since Wednesday there has been less animation and are down ½c. from Wednesday's rates with a rather oppressive offering. Sales were so limited yesterday that not much of a scale of prices could be established. Several car-loads of Colorados changed hands at 7¾@8c. to dress 55 lbs.; common to good native steers 8c. to dress 55 lbs. to 12c. to dress 57 lbs. No choice quoted.

COWS AND CALVES.—Supplies have run larger and an active demand has used them up. Ordinary to prime milch cows sell at $40@65; extra natives $70@75 in a single way.

VEAL CALVES.—Calves continue in light supply and firm prices rule for all decent stock.

Live calves, prime N. J., 9¼@9½c.; do. State, 9@9¼c.; poor to good, 6@9c.; Mount Hollys, 7@9¼c.; buttermilks, 4½@5½c.; grassers, 3@3½c.; up-river dressed choice, 13@14c.

SHEEP AND LAMBS.—Receipts for the week, 35,962 head; do. last week, 45,473 do. A few prime lambs and some choice wethers were wanted at Jersey City and would have brought good prices, but common stock was dull and heavy. The extreme prices obtained at 6th street yesterday under a pressure could not be maintained to-day, and lower rates were accepted before the close. Poor to fair sheep are quoted at 3½@5¾c.; good to choice do. at 5½@6c; poor to fair lambs at 5¼@6½c; good to prime at 6¾@7¼c; bucks at 3@3½c.

SWINE.—Receipts for the week, 25,621 head; do. last week, 27,471 do. Market for live firm and high. For Ohio a range of $7@7.12½ ₱ 100 is given. New Jersey pork, 9¼@9½c. light; other weights, 8¼@9c.; city dressed, 8¼@9c.

Terms for 1881.

FARMING FOR BOYS AND GIRLS.
No. 37.

HENRY STEWART.

Barley.

ONLY good farmers can grow barley. But this should not prevent farmers from growing it, because every one who has a farm should determine to succeed in everything he undertakes to do, and therefore a difficulty should be met and conquered, rather than let it overcome him. So that because barley is a difficult crop to grow, every one should try to grow it, until he succeeds, and then there is nothing but what he may be able to do in the way of growing good crops? Barley was once the principal bread grain of the world. The ancient Egyptians believed it to have been the first grain used by mankind, and as was their habit in regard to valued things, they believed it to have been brought into the world by a goddess, Isis. This of course is only an imaginary fiction, but it shows how ancient the use of this grain was in the earliest times, and how much it was valued. We remember how Ruth gleaned barley in the field, and how Abraham set barley cakes before the angels who visited him. It is certain that barley was far more commonly used than wheat, and that its origin is so far back that no one knows where it was first grown. It probably originated in Syria which was the earliest inhabited country in the world and where it was used for the bread of mankind and for grain for horses.

There are four species of this plant. Common barley is a Spring grain and is six-rowed; two-rowed barley is also a Spring grain, and is grown more than any other kind because it is preferred by brewers on account of its good quality for making malt. Winter barley is four-rowed or square-headed. There is also a beardless variety which is rarely cultivated. With the exception of the last mentioned variety, barley is bearded; and the beards are much stiffer, stouter and longer than those of wheat and rye. A grain of barley measures about one-third of an inch (.345) in length and a barley-corn has been considered as a measure, for centuries; three barley-corns being equal to one inch.

This grain is more cultivated over the world and supports a larger number of people than any other. It grows with great rapidity and in some countries two crops of it are taken from the ground in one year. In far northern climate, as in Lapland and Siberia, where the Summers are very short and very warm, the barley matures in six weeks from the sowing of the seed. No other grain could be grown in such a short Summer as prevails in that northern latitude. Barley is therefore seen to be more important to the subsistence of mankind than wheat. It will grow upon any kind of soil that is well manured. The best soil is a rich strong loam, but it succeeds very well with good tillage on light sandy soils. It is the most nutritious grain for horses and poultry, but as we can produce corn more cheaply than barley, the latter is rarely grown here for that use. It is grown in America only for the use of the brewer. It is preferred for this use because it contains about six per cent of a sort of sugar which makes it valuable for making malt.

Malt is the grain of barley, steeped in water and put in heaps until the young sprouts and rootlets appear; it is then dried in kilns. This process changes some of the starch of the grain into sugar and the malt is remarkably sweet. It is this sugar which is changed into alcohol by the fermentation of the malt infusion which is thus made into ale and beer. The invention of this popular drink is said to have been made by the ancient monks, who certainly were very good brewers and loved good ale. Some persons think it is wrong to grow barley for this use, as it is very certain that much misery happens to many persons who drink liquors to excess. It is no doubt wrong for any man to do a thing he believes to be wrong; but whether it is wrong or not to grow barley is a question every one must decide for himself. It is a profitable crop as it yields on good soil 40 or 50 bushels to the acre and the straw is valuable for feeding.

DAISY'S YEAR IN SOUTHERN CALIFORNIA.

ALICE P. ADAMS.

Dona Eulalia Perez Guillen.

VIOLET and Daisy were looking over the contents of the card receiver. This was a quaint affair, made of thin sections of cactus from which the succulent tissue had been removed, leaving a framework which, for beauty and delicacy, could not be surpassed by the finest carving. The basket was varnished, the sloping sides were tied by blue satin bows, and the whole formed a dainty ornament for any parlor table.

Under the cards were a number of photographs that Daisy took, hoping to recognize some old acquaintances; but at sight of the first she exclaimed, "Violet Erman, what creature is this?"

"Violet laughed. "Oh, that is the picture I've been intending to show you. I wondered what had become of it. Now can you tell which of our numerous relatives that is? And don't you think I strongly resemble her?

"Stop your nonsense, and tell me who it is," answered Daisy. "If any of your relations are as hideous as this I think they would be justified in committing suicide."

The card she held in her hand represented a blear-eyed, hollow-cheeked old woman in a dark calico dress. There was no trace of comeliness in her face or figure, and Daisy gave utterance to a most natural opinion when she pronounced the picture "hideous."

"Who is it?" she asked again, impatiently. "How mean you are, Violet, not to tell!"

"That, my dear, is, or rather was, the oldest woman in the United States," said Violet with a tragic gesture toward the subject of this discussion. "Shall I give you an historical sketch of the lady I learned from one of the papers some time ago? 'Dona Eulalia Perez Guillen was born in Lower California, and there married; and when San Diego was first settled in 1769, she was the mother of four children, and accompanied her husband, who was a Spanish soldier, to that place. He was transferred to the Mission San Gabriel soon after its founding in 1771."

"Oh! give us a rest! as Bert would say," laughed Daisy. "You know I can't endure history, and you have poured enough into my unwilling ears to last me for the rest of my natural life."

"You wouldn't have stopped me so easily, young lady," responded Violet, "only I forgot what came next."

That was fortunate for me. But now I would really like to know more about this woman. What did you say her name was?"

"Dona Eulalia Perez Guillen," drawled Violet. "But that's too long for every day. The people about here always called her 'the old woman.' Not a very beautiful title, but we all knew who it meant."

"Is she alive?"

"No, she died three years ago in the Summer. I remember asking one of the girls who lived near what was the matter with her, and she said that she died of old age! She was not sick at all, but died while sitting at the table."

"And you say that she was the oldest woman in the United States. I believe San Gabriel has more than its share of objects of interest. How old was she?"

"They could not tell her exact age," said Mrs. Erman, who seated herself in a rocking-chair, sewing in hand, but from different events that she remembered they knew she must be between 140 and 145 years old. She had been married a number of years when our Mission church was built, and that was one hundred and ten years ago."

"Where did she live?"

"In a little *adobe* house about a mile and a half from here. She lived with her youngest daughter, a Mrs. White, who is considerably over eighty."

"There are over one hundred and seventy-five of her descendants now living," continued Mrs. Erman as she turned a hem. "They claim to be the only pure Spanish at the Mission; but I am sure some of them look as if there might be a large proportion of Indian blood in their veins."

"Of course you have seen the lady."

"Yes, we all went to the house once with some friends who were visiting us," said Violet. "She was sitting in one of the doorways as we drove up, but went into the house when she saw us, and we found her ready to receive us in the best room. This was long and narrow, and I remember there were several large pieces of embroidery and queer old pictures there."

"But how did she look? Like this photograph?"

"Yes, only worse, if that is possible. Her skin was dreadfully wrinkled, and looked more like old leather than anything else. She could see without glasses, but her eyes were quite sunken and the lids were very red, the lower ones seemed to be turned almost inside out, so that I could not bear to look at her. Of course she had lost all her teeth years and years before, but they said she fed herself without any help."

"I was surprised at one thing, Daisy," interposed Mrs. Erman, "and that was the appearance of her hands. They were not contracted and drawn out of shape as is frequently the case with very old people, but were still well-proportioned, and her fingers were tipped with finely-shaped nails that many a younger person might have envied. I had abundant opportunity for observation as she made a great many gestures."

"I suppose her hair was white," said Daisy.

"Yes, it was when we saw her, and it was braided in several queer little tails. But it is said that a few months before her death it commenced turning black again."

"What did she wear?" asked Daisy, with pardonable feminine curiosity.

"Oh, she had on an old, brown calico dress, and had two little bags hanging from her neck that mamma thought must contain charms—one in front and one behind; and fastened to her sleeve was a cross and rosary."

"Could she speak English?"

"Not a word," said Mrs. Erman; "but she jabbered incessantly in Spanish, and one of her great-granddaughters—a handsome, dark-eyed *senorita*—acted as interpreter. And we found that the old lady was trying to tell us how much finer the country used to be, and what a great deal of money the people had before so many new settlers came! But I believe that is the general feeling among the old Spaniards. Many of them have lost their immense ranches, flocks and herds through mismanagement, and they throw all the blame on the new-comers."

"Some of her relatives were determined to take her to the Centennial," said Violet, "and the poor old creature was crazy to go, for she thought it would make her rich, and, more than all that, she would learn to speak English!"

"I believe they had quite a law-suit over it," added her mother. "Her mercenary friends were determined to regain a part of their lost wealth. But Mr. White said that she could not have endured the long journey, as she seldom left the house—not to speak of the unaccustomed excitement at the Exposition. It was fortunate that the suit was decided in Mr. White's favor, for the poor creature would otherwise have made the vain attempt to gain wealth and wisdom."

"And the proprietor of Woodward's Gardens at San Francisco offered five thousand dollars for the privilege of exhibiting her a few months, but Mr. White would not consent to let her go."

"When our visit was ended and we rose from our chairs she rose also, and as she stood by Mrs. Brewster, who is very small, you will remember, I noticed that Señora Guillen's head just reached our friend's shoulder. And yet they told us that she was a remarkably tall woman in her prime!"

"She shook hands with us all in a very friendly way, particularly with papa—how she did grin when he left four bits in her hand!" Violet laughed aloud at the recollection. "And as we were getting into the carriage she bade us *Adios!*"

"And what does that mean?" inquired Daisy.

"Well, Daisy, have you been here all these months without hearing *Adios?* It means good-bye. Bert, let us say *Adios* to the old woman for to-day. Come, mamma, put up your sewing and play a game of croquet with us before it is time to go for the mail."

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK.—I will send you a letter written by an Indian boy at the "Arapahoe Mission," Indian Territory. My brother brought it when he returned from there. I think it is very well written—don't you? The Mission has scholars from four years to twenty years of age, the youngest is a wee little tot of four years old, just baptized, and she feels too important to have anything to say to the camp-occupants of her race any more. I wish the writing could be published as it is. The letters are written as school exercises.

Truly yours,
Madison, Wis. FRANKIE BROOKS.

ARAPAHOE MISSION

Miss Lounnond I like to write on paper I think this letter is good dont you think Miss Lounnond? I think very nice I want write on paper I saw white man he can hardly walk. his name is Mr. Seger he is so slow when he walks. just like Corry. Funny man Mr. Seger make laugh, I think that is pretty good, I am write too much this night. I think willie is pretty good boy he wants to make fun every day. I write both sides of my paper that is all

My name is Mr. Paul

UNCLE MARK.—I noticed by the RURAL of Aug. 20th that one could become a member by simply sending their address. My father, through the Chicago Weekly Inter-Ocean, became a subscriber to the RURAL, in which I read many pleasing and instructive things of good to me. During last Winter, when we lived in Montgomery County, Iowa, we lost everything in the house by fire. Some one writing to the RURAL from Northeastern Iowa has induced my father to go up there to buy a house. He is now up there looking up land.

Your would-be niece,
MARY ELIZABETH BOHN.
Dallas Center, Iowa.

Sabbath Reading.

SEEDS.

WE are sowing, daily sowing,
Countless seeds of good and ill;
Scattered on the level lowland,
Cast upon the windy hill;
Seeds that sink in rich brown furrows,
Soft with heaven's gracious rain;
Seeds that rest upon the surface
Of the dry, unyielding plain.

Seeds that fall amid the stillness
Of the lowly mountain glen;
Seeds cast out in crowded places,
Trodden under foot of men;
Seeds by idle hearts forgotten,
Flung at random on the air;
Seeds by faithful souls remembered
Sown in tears, and love, and prayer.

Seeds that lie unchanged, unquickened,
Lifeless on the teeming mold;
Seeds that live and grow and flourish
When the owner's hand is cold.
By a whisper sow we blessings,
By a breath we scatter strife;
In our words and looks and actions
Lie the seeds of death and life.

Thou, who knowest all our weakness,
Leave us not to sow alone!
Bid thine angels guard the furrows
Where the precious grain is sown;
Till the fields are crowned with glory,
Filled with mellow ripened ears—
Filled with fruit of life eternal,
From the seeds we sowed in tears.

AN EXQUISITE FLOWER.

BOTH in shape and hue, the rose of Sharon is an exquisite flower. Its blossoms are bell-shaped, and of many mingled hues and dyes. But its history is legendary and romantic in the highest degree. In the East, throughout Syria, Judea, and Arabia, it is regarded with the profoundest reverence. The leaves that encircle the round blossoms dry and close together when the season of blossoms is over, and the stalk, withering completely away at last from the bush on which it grew, having dried in the shape of a ball, which is carried by the breezes to great distances. In this way it is borne over the wastes and sandy deserts, until at last, touching some moist place, it clings to the soil, where it immediately takes root and springs to life and beauty again. For this reason the Orientals have adopted it as the emblem of resurrection.

THE sun may grow dim in the heavens; the stars may burn out in the distant sky; heaven and earth may pass away; the sea may vanish from our view; men may fall from their steadfastness, and angels may fail to keep their high estate; but the Lord's promise will not fail, and He will fulfill His word. With this assurance we may bid adieu to anxiety and fear, and heed that word which says, "Let your conversation be without covetousness, and be content with such things as ye have, for He hath said, I will never leave you nor forsake you. So that we may boldly say, the Lord is my helper. I will not fear what man shall do unto me."—The Christian.

THE sheep are not always led through green pastures. The path is sometimes bestrewn with craggy rocks; sometimes over precipices. Sometimes the storm hangs dark, the whirlwinds blow, the hail cuts, and the lightnings flash. But keep near to the Shepherd—keep on upward through the darkness. The storm will pass away, the rugged path will end, and the Lord who is our Shepherd will lead us at least into the green pastures and beside the still waters.—E. H. Chapin.

"THE Church of the living God," "the whole family on earth" is not shut up within the narrow limits of any sect, or environed by the creed of any denomination. Be ours to cherish loyally the institutions of our own, but saying, at the same time from our heart, "Unto all that in every place call upon the name of Jesus Christ our Lord, both theirs and ours, grace be unto you and peace from God our Father, and from the Lord Jesus Christ."—Dr. Eddy.

WHERE the mind is left free, religion can never have dangerous enemies, for no class has then a motive to attempt its subversion; while the interests of society demand a foundation for the principles of justice and benevolence. Atheism is a folly of the metaphysician, not the folly of human nature.—George Bancroft.

THERE is only now and then an opportunity for displaying great courage, or even great wisdom; but every hour in the day offers a chance to show our good nature, charity and kindness of heart.

Many mourn for their sins who do not repent of them; they weep for them, but continue in them.

We ought to school ourselves not to add, by word or look, to the unhappiness of those who have already enough to bear.

PERSONALS.

Orson Pratt, one of the Mormon apostles, died at Salt Lake City a few days ago, aged 75 years.

Senator Beck thinks King Kalakaua one of the best-informed and best-educated men he ever met.

The fund for Mrs. Garfield closed on Saturday, Oct. 15, and is known to have then amounted to over $400,000.

Captain Jack's lieutenant in the Modoc war, Scar-faced Charlie, is now a peaceful farmer at Quapau, in the Indian Territory.

George M. Seoville, Guiteau's brother-in-law and counsel, says that the prisoner's only brother, John M. Guiteau, of Boston, refuses to have anything to do with the coming trial.

The total expenses of Pres. Garfield's illness and burial are put at about $335,000, of which Congress will be asked to pay $100,000; the State of Ohio $25,000 and private parties have to pay the remainder.

W. F. Cody, known to fame as "Buffalo Bill," was shot at three times by a crank at Council Bluffs, Iowa, the other evening. One of the bullets "grazed his cheek," and probably got flattened in so doing.

Nelson W. Aldrich, Rhode Island's newly-elected Senator, is said to have entered Providence when a youth in the same modest manner that Whittington entered London—on foot and with his clothes slung over his back. He procured employment in a wholesale grocery store and gradually rose in life till he is now the head of one of the largest firms in the State. He is Grand Commander of the Knights Templar of Massachusetts and Rhode Island.

The trustees of President Garfield's estate will assume that the estate is responsible for the expenses of the president's illness and death, and ask the doctors to present their bills. Whether Congress will take action in the matter remains to be seen. The property left by the late president consists of the Washington home, the Mentor estate, a half interest in some Virginia land worth about $1500, a little Chicago real estate of small value, some mining stocks and the life insurance of $25,000.

DUTCHESS NURSERIES.

W. L. FERRIS, JR., Poughkeepsie, N. Y.

THE MARSHALL PEAR.

A fine, new American variety. It is juicy, buttery, neither sweet nor sour, has a thin skin and white flesh. It ripens ten days later than the Bartlett and possesses superior shipping qualities. The fruit is smooth, does not crack or canker, and is very attractive while growing and when ripe. Thomas Meehan, editor Gardeners' Monthly, says:—"We regard it as a valuable acquisition." For particulars, etc., address

P. H. FOSTER,

Babylon Nursery, BABYLON, L. I.

D. LANGELL'S ASTHMA & CATARRH REMEDY.

Having struggled 20 years between life and death with ASTHMA or PHTHISIC, treated by eminent Physicians and receiving no benefit, I was compelled during the last five years of my illness to sit on my chair day and night gasping for breath; my sufferings were beyond description. In despair I experimented on myself by compounding roots and herbs and inhaling the medicine thus obtained. I fortunately discovered this **WONDERFUL CURE** for **ASTHMA** or **CATARRH,** warranted to relieve the most stubborn case of Asthma in **FIVE MINUTES,** so that patient can lie down and sleep comfortably. Any person not fully satisfied after using one-third of a box can return the remainder to the proprietor and the money will be refunded, or send me your address for a trial package **FREE OF CHARGE.** Should your druggist not keep the remedy, I can send it by mail on receipt of the price **$1.00.** For sale by all Druggists. Address D. LANGELL, Proprietor, Wooster, Ohio, or **ALBERT IMGARD,** Manager, 46 Astor House Offices, New York City.

Humorous.

REV. MR. PIPER was called upon to marry a man to his fourth wife. As he approached the couple, he said: "Please to rise." The man wriggled about in his chair, and finally spoke: "We've usually sot."

A DETROIT young man denounces the poke bonnets, "because they chafe his ears." Here, now, is a question for scientists. Can they explain how it is that a poke bonnet worn by one person can chafe the ears of another person not wearing it?

"My son," said the wise father, deftly laying the skate strap along the shrinking back of his howling son, "I'm doing this for your own good." And as the lad jumped clear over the saw-buck he wailed, "Don't make me too good, dad; 'be not righteous overmuch,' you know."—Burlington Hawkeye.

A LITTLE girl has an uncle who has taught her to open and shut his crush hat. The other evening, however, he appeared with an ordinary silk one. Suddenly he saw the child coming, with his new silk hat wrinkled like an accordeon. "Oh, uncle," she said, "this one is very hard? I've had to sit on it; but I can't get it more than half shut."

THE UNEXPECTED ALWAYS HAPPENS.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME.

VOL. XL. No. 1657.} NEW YORK, OCT. 29, 1881. {PRICE FIVE CENTS $2.00 PER YEAR

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Horticultural.

BAUHINIA CORYMBOSA.

THE Gardeners' Chronicle of England presents an original drawing of Bauhinia corymbosa which we should think would prove a decided acquisition in this country as it would be very likely to prove hardy. Indeed it is surprising, as the Chronicle remarks, that this fine climber should be so little known. Our picture has been reproduced from the above. The leaf consists of two oblique, oblong-obtuse leaflets, covered with reddish down on the under-surface. These twin leaflets suggested to Linnæus the propriety of dedicating the genus to the memory of the two botanist brothers, John and Casper Bauhin. The flowers are in loose racemes, the long flower-tube resembling the spur of a pelargonium, and encircling the long, slender stalk surrounding the ovary. The five petals are regular, pinkish, crenulate at the edge, and only three out of the five stamens are perfectly developed.

RAYS.

A NEIGHBOR came to me the other day for advice regarding "geraniums" to bloom in the Winter. His plants were planted out during the Summer months; they grew rankly and bloomed well, but as it was now October he guessed he should have to lift and pot some of them to blossom in the house during the Winter months, and he hated to, too, as they were so pretty in the garden whose good looks he should mar by their removal, and there were no signs of frost yet. You are too late, my friend. You may lift them now, trim them in a little, pot them in somewhat small-sized pots and get blossoms in early Spring. Geraniums require time to mend their loss of roots and crops, and although they may develop all the flower-buds set on them now, they will not likely form new ones till they recover from the check of shifting. Geraniums for winter-blooming should be set out by themselves, say in a row or bed in the vegetable garden, in an open, sunny place with plenty of room, and their shoots be kept shortened back. About the first of August they should be lifted and potted and the pots plunged in the earth with a piece of slate or wood or a lot of ashes under them to exclude worms. They will soon set to rooting and growing, and you must keep pinching. Those required for very early blooming, say in October or November, should not be shifted again, but, instead, fed with manure water; but those required in December and later may get another shift. Geraniums love full sunshine and a light, airy place, and blossom best when they become pot-bound, that is, when their pots are full of roots.

* *

MANY growers have ceased to plant out their winter-blooming plants, as geraniums, stevias, mahernias and the like, on account of the gross growth they make, no matter how tended. For my own part I prefer planting out, if for no other reason than to get a vigorous start, but at the same time I emphasize early lifting and potting and plunging out-of-doors for the rest of the season. Plants keep clean and stocky and have firmer and better flower-bearing wood in October than if not lifted till the end of September.

* *

WHAT a grand system of parks the Chicago folks can boast of, and what belts of glowing colored plants may be seen there; such profusion and such variety! Still if there are not in the vegetable kingdom plants enough to paint the flower-beds of the Chicago gardens, the gardener has to summon to his aid sea-shells, whole and broken! What a libel on horticulture, what an abortion of that which should be beautiful—a flower-bed. But I have seen worse things where better might be expected, namely, in Massachusetts. A few years ago I visited a pretentious private garden there. There were caged animals in a wood, buffalo in a field, monkeys in a house, ground traps to take folks by surprise, funny things in a museum, and a spacious garden filled with flower-beds. In a series of scroll beds Mexican cotyledons were freely used, and, to add color to the beds, minced glass and earthenware—blue, white and red—were introduced in lines and patches! I surely hope no reader of the RURAL will ever endeavor to imitate such hideous apostasy. In your flower-beds grow what plants you have or can conveniently get—marigolds, asters, dahlias or whatever else you please, but call in no extraneous matter and make what should be beautiful detestable. And in that Eastern garden, too, is a grotto, to enter which each of us paid 10 cents. That, too, is another meaningless, abhorrent feature to be avoided in gardening; a grotto may be novel, is it beautiful? is it useful?

* *

WE are lifting our plants and housing them so that frost may not reach them, and as some of your readers have green-houses, let me say a word to them. In Spring, when plants are growing, they need a rising temperature; in Summer, while they are in vigorous growth, a uniformly high one, and in the Fall, when they have completed their season's growth, a temperature under that of Summer, and gradually and steadily lower until we reach the minimum, say 45 or 55 degrees, more or less as the case may be. Better be very careful in lifting and potting your plants, than lift carelessly and have to place them in close, warm houses to recuperate. * *

I HAVE a fine lot of Chinese Primroses, and I have just been shifting them from five-inch to six-inch pots. Now I don't believe in crocking pots of four inches and under for quick-growing and soft-wooded plants, but for pots over four inches I think a little drainage is a benefit, and my primroses corroborate my opinion. Several of the five-inch pots had no drainage; others had it, and throughout the drained pots showed a decided advantage; they were much better filled with roots than those that were not drained. My primroses are grown in cold-frames wherein the pots are plunged in coal ashes.

* *

IF YOU have not scuffled them out, you will find lots of young seedlings of Sweet Williams, Canterbury Bells, Foxgloves, and Perennial Larkspurs around the parent plants. Now if you prepare a bed of light, mellow soil in some sheltered corner, and plant in it, in rows, these little seedlings, the young plants will grow much better than if left where they germinated, and, all being together, you can conveniently give them a little protection in Winter, say with some tree branches or sedge grass. A cold-frame, if you have it, is a better place. The Larkspurs will bloom next year; some of the Foxgloves ought to; but neither the Sweet Williams nor the Canterbury Bells will blossom till the year after. LEON.

Farm Topics.

EXPERIMENTS ON THE USE OF WILTED POTATOES AS SEED.

PROF. F. H STORER.

IT has repeatedly been alleged by practical men that the yield of potatoes is increased when the tubers used as seed are allowed to wilt before they are planted. The justice of this idea has been verified by a Bavarian experimenter, Dr. Kraus, who has recently tested the matter methodically; once in a dry year, and again in a season favorable for growth. Kraus propounded to himself the following questions: How great a difference is there between the growth of the vines from fresh and from wilted seed? What is the cause of this difference? and what relation does the increased or diminished growth of the tops from wilted seed bear to the yield of tubers? For his experiments, he used whole potatoes, both large and small; some of them he planted when they were fresh, others after they were slightly wilted, and others still after they had been strongly wilted.

When fresh and wilted seeds were planted side by side the shoots of the fresh seed started first above the surface of the ground. The retardation due to wilting was not particularly noticeable in case the season was moist and the seed large, not even when the seed had been strongly wilted, but it was distinctly observable when small seed was used; and, in case the season was dry and the seed was delayed very decidedly, the vines from large seed grew appreciably higher in all cases than those from small seed. But while, on the one hand, these differences tended continually to disappear when fresh seed had been used, they always increased in the case of wilted seed, and to the disadvantage of the vines grown from small seed. When the seed potatoes were large and the season favorable for growth, even strong wilting did not perceptibly diminish the development of the vines. Wilting of the seed potatoes appeared not to have any influence on the time of blossoming. But in a very dry season it happened that the flowers became abundant upon the vines from

wilted seed sooner than they did on the others. It was noticed incidentally that the vines from large seed flowered before those from small seed. When small potatoes were used as seed, a decidedly larger number of stalks grew from those tubers which had been strongly wilted than from those which were planted in the fresh state. At the same time a slightly larger number of prominent stalks were obtained from the wilted seed than from the fresh seed, but the average hight of the vines grown from wilted small potatoes was less than that of the vines grown from fresh seed; whence it appears that the stalks from wilted are really less vigorous than those from fresh seed.

Large seed not only gave a larger number of stalks anyway than small seed, but the number of stalks was still further increased when the large seed was slightly wilted. There was, however, no increase in the number of stalks on wilting the seed more strongly, though the number of strong stalks from a given seed increased. In a moist season, it was judged from the appearance of the vines that the term of growth of the plants from wilted seed had not been perceptibly shortened; but in a dry year it appeared distinctly enough that the plants from wilted seed ripened earlier than the others. At the time of harvest there were obtained both a decidedly larger number and a much larger weight of potatoes from the seed which had been wilted than from that which had been planted fresh. And it appeared that in general the productiveness of each single stem was greater in proportion as the seed from which it grew had been more strongly wilted. Large seed always gave better results than small seed, of similar condition; but there was obtained from small wilted seed almost as large a yield, both in respect to the number and the weight of the tubers, as was got from large fresh seed. It appeared, furthermore, that wilted seed yielded a somewhat larger number of small potatoes than were got from fresh seed, and the difference was specially marked in the case of experiments made in a particularly dry season.

Similar experiments made with Jerusalem Artichokes gave corresponding results. It was specially noticeable that the plants grown from wilted seed were much less vigorous than those from fresh seed. Some of the wilted seed never grew at all, especially in cases where the sets were small; and during the entire period of growth the stalks from wilted seed were always inferior to those from fresh seed, and this in spite of the fact that a larger number of stalks grew from the large wilted seed than from seed of the same size when fresh.

In seeking to explain the cause of these appearances Dr. Kraus argues that, owing to a deficiency of water in the wilted seed, the development of the eyes at the butt or "seed-end" of the tuber is hindered to such an extent that a larger number of the side eyes find opportunity to send forth shoots than would otherwise be the case. If the seed was planted in the fresh condition, the eyes at the seed-end would naturally develop first, and were it not for the lack of water they would start so quickly and grow so rapidly that most of the side eyes would have no chance to grow at all. By hindering, at the start, the natural development of the eyes at the seed-end, a comparatively large number of the side eyes are enabled to develop, even to the stage at which they strike root for themselves and support an independent existence. This view consists perfectly with the observed facts that the sprouts from wilted seed appear above ground at a later period than those from fresh seed; that the wilted seed give a larger number of stalks; and that there are more tall stalks to the hill, and more tubers. Naturally enough, the larger the number of independent stalks there are the more potatoes will they produce. But, from the very nature of the changes brought about by the wilting, it is manifest that little if any advantage can be expected from wilted seed unless the soil is good and the season favorable throughout the term of growth of the crop. In a very dry year, for example, Kraus got no larger weight of potatoes from his wilted seed than from the fresh seed, although the number of tubers to the hill was actually greater. There would be small use in striving for many potatoes to the hill unless the conditions are such that the tubers can grow to a good size.

It is plain that these experiments have an important bearing upon some other points in potato-growing beside those specially studied. They reënforce, for example, the modern view that it is best to put comparatively few eyes in each "hill," in cases where potatoes are grown for table use. It is thought by many farmers now-a-days that our ancestors were decidedly at fault when they took pains to plant a large number of eyes; and the old plan of putting a couple of large potatoes in each hill has in good part given place to a system in accordance with which no more than two eyes are planted in a given place. The motive for this change is the desire to get the largest possible number of merchantable potatoes and few small ones, and it is plain that, as soils and seasons go, the desideratum will be much more likely to be obtained where there are no more than two competing plants at a given spot than where there are a dozen.

It is noticeable that these experiments, made with whole potatoes, do not touch the question of the utility of wilting seed that is to be cut to the small number of eyes customary in modern practice. Even the explanation offered by Kraus fails to meet this consideration. In this respect it is less satisfactory than a suggestion made some years since by Franz, viz., that the process of wilting involves a transfusion of soluble matters from one part of the tuber to another, of such kind and character that the side-eyes have a better opportunity to draw in nutriment than they had before. This suggestion has much to recommend it, for undoubtedly one necessary consequence of the loss of water during the wilting is that the contents of the cells, such as albumen and other matters fit to feed the young shoots, must move about from one cell to another and be readjusted, as it were, but as a result of these movements, there is a certain tendency in the potato to germinate, that is to send forth shoots, or, at all events, to make the eyes begin to start; and it is a fact, thanks apparently to the slow and equable transfusion of nutritive matter, that the side eyes get almost as good a start, or preparation for starting, as those at the seed end. Were it not for the movements induced by the wilting, that is to say if the potatoes were put in the ground in the fresh state, a large proportion of the original soluble food contained in them would go at once to start the seed eyes and the side eyes would have comparatively little chance to prosper.

In reply to the question, how far the process of wilting should be pushed? Franz argues that it should never be allowed to go so far that the potatoes cannot be handled and transported without risk of rubbing off the the sprouts; but that up to this point wilting is advantageous. The wilting needs to be gradual and may be effected in a light, moderately warm place. It appears, however, from the foregoing that there would be no sense in trying to hasten the process by means of artificial heat. It would seem, moreover, that if potatoes are to be wilted, the wilting should occur before they are cut for seed, and not afterwards, and this remark must be specially true in case the eyes at the seed-end are not to be planted. It is a noteworthy fact that some American farmers discard altogether the eyes at the seed-end of the potatoes and throw it aside when preparing the tubers for planting, apparently for the reason that it is not easy to leave attached to these crowded eyes such a supply of the substance of the potato as would serve for the proper nourishment of the young shoots. But it is notorious that the seed-eyes of unwilted potatoes are provided naturally with a somewhat better supply of nourishment than the side-eyes, and if wilting does really serve to transfer some of this superabundant food to other parts of the tuber, it should manifestly be allowed to occur before the time of cutting. Furthermore, there would seem to be no good reason why the eyes at the seed-end should not be planted, in case the potatoes have been wilted. The smallness of the slice attached to these eyes will be no great detriment provided the sprouts are fairly started, for, in that event, enough nourishment will have gone into the sprout to insure its continued growth.

VARIOUS TOPICS.

B. F. JOHNSON.

Ears with the Shucks on.

In writing from any given section of the country it is almost always well to preserve the local color, and therefore in the epigraph above I have chosen the word "shucks" in preference to husks—the one being a common and the other a sectional word. Thus the Illinois farmer "shucks" his corn but does not "husk" it, and he cuts it up and puts it in "shocks," but not in "stooks."

And, by the way, in cutting up corn the green-hand finds it very difficult at first to place the corn so it will stand without further support than the three or four tied or top-fastened stalks he begins with—simply because he has not acquired the knack of setting up each armful perpendicularly. But this is easily corrected if, instead of cutting around one way till the shock is finished, he cuts first from right to left once round, then from left to right the next time, and so on until the job is finished. In this case the inclination to slant one way is corrected by half the armfuls leaning in one and half in the opposite direction. Good corn is commonly cut up from 14 to 16 hills square, and when the work is well done the shocks stand without support and without tying, through the stormiest Winters.

We often meet with striking examples how that which may be true for the East is not true for the West in many matters of agricultural practice. As an example: the agricultural editor of a New York city paper applauds the course of a correspondent who at the South commenced a clearing—deadening the trees in the Spring contrary to the advice of his neighbors and in opposition to the local custom, which is to do all that work in the Autumn. The reason given for this course in the South is that when the wooded surface is exposed suddenly to the heat of the direct rays of the sun in Summer, the soil is impoverished in some way—many say by too great an evaporation of the nitrogen, which does not take place in so great a degree in the North. And one objection which cotton planters make to small grain crops is that baring the surface in May and thereafter leaving it exposed to the sun in the hottest part of the year, deprives the soil of much of its natural fertility, which cannot be recovered for several years.

And this may be the explanation of the advantage which follows summer-fallowing on the strong, black soils of the prairie. If these new soils are not summer-fallowed, the wheat crop is apt to fail in respect to the yield of grain, but not of straw, which is liable to rust and lodge. But as the soil loses a portion of this excess of nitrogen the custom is abandoned and we see the summer-fallow system gradually going out of use—as some time ago in Ohio, and more lately in Indiana, Illinois and farther west, as these lands become worn and partially exhausted of their nitrogen, and their vegetable matter is reduced. These and the above are facts perhaps worth Mr. Lawes's attention in discussing the subject of the relation of nitrogen to crops.

And in this connection let me ask if Mr. Lawes has a correct idea of the greater amount of nitrogen in the atmosphere in the West and South than in the East and North. As a measure of this difference, he is probably not aware that an unpainted tin roof, in the latitude of Toronto or Montreal or Quebec, will remain bright and sound for a quarter of a century; whereas in the latitude of Chicago, St. Louis or Vicksburg it would tarnish in a month, and rust out in a year or two. This is on account of the little nitric acid precipitated from the atmosphere in the North and the much more in the South, so much that bright steel and iron surfaces show red-rust in a few minutes after being exposed to the drops from a passing shower. Until Mr. Lawes sees the corn fields of Illinois, the cotton fields of the Yazoo River country in Mississippi, and the sugar-cane fields of the Teche, in Louisiana, he will have but a feeble conception of the role nitrogen plays in the crops of the West and South in comparison with those of the East and the North.

In reply to an inquiring subscriber another editor of a paper of great political reputation in the same city, says barbs on fence wire are barbarous and unnecessary, adding that a fence of smooth wire answers an equally good purpose. Now the facts are that, some time about 1860, Messrs. Miller & Toll, then broom corn growers on a considerable scale, put up a considerable length of smooth wire fence to protect a young hedge in the first place, and their crops in the second. But their example was not followed, since a smooth wire fence was found unequal to turning swine, and cattle quickly learned to reach through and strain the wires so they were displaced or gave way. But better testimony of the worthlessness of smooth wire is furnished by the experience of the Illinois Central Railroad Co., which has built several hundred miles in Illinois along its line. In the beginning, five wires were used, three barbed and two, the second and the fourth, smooth; but the fence was soon found insufficient and the smooth wires have been taken out and barbed ones substituted.

Barbed wire having come so suddenly into fashion as a part of the material for the best and cheapest fence, the substitution of iron for wooden posts was necessarily not far off. And now a fence consisting wholly of iron is made and sold for 50 cents a rod for short distances and something less for long ones. This fence consists of three doubled and twisted barbed wires and a post of inch iron gas-pipe five-and-a-half feet long, furnished with a flange and that with triangular wings, which, set a rod apart, keep it in place. A mile of three wire fence complete (so the inventors say) weighs less than a ton and may be put into a common wagon and set up by two men and a pair of horses in a comparatively short time. That the objections to barbed wire on the score of barbarity, is one wholly of ignorance and a false sentiment, is proved by the rarity of accidents on the Illinois Central Railroad, which was the first to adopt and introduce it into Southern Illinois, where the contour of the surface and the character of the animals are such as to invite accidents of the kind.

The Apiarian.

WINTERING BEES.

PROFESSOR A. J. COOK.

Surely, after the experience of last Winter, when the loss of bees was so great and widespread, no subject is more worthy of intelligent discussion and more sure to gain an appreciative hearing among bee-keepers than that of wintering. After close observation and varied experiments for a series of years, I believe I may say that certain practical points are well settled, and so most worthy of the attention of bee-keepers.

1st. It is certain that bees should have in the hive at the commencement of Winter at least 30 pounds of good, wholesome food. This does not mean glucose or thin uncapped liquids obtained from cider mills, etc. It means good, capped honey, or else sirup made of coffee "A" sugar, or from granulated sugar, which, if the latter is used, must be fed in time to be all capped over before cold weather comes. It is often suggested that the beautiful white honey of early plants, like linden and white clover, is safer than the later grades which come from buckwheat and the various Fall flowers. I think there is no ground for this opinion. I have tried each kind repeatedly and see no difference. The late honey may be more apt to be mixed with unwholesome liquids and so not so good. This is more likely, as after the Autumn harvest is over the bees are very strong in numbers, and being always eager to store, they make free to collect the oozing juices of wounded fruits and the liquids about sorghum and cider mills. Except from such impurities, I should feel that Autumn honey was equal to any other. I do not know from experience that it is not anyway; but many apiarists think that it is not, and there seems reason for the opinion.

If the 30 pounds of honey are not in the hive, and cannot be supplied, then the bees must be fed either extracted honey or good sirup, as suggested above. From reason and experience alike, I believe that the honey should be concentrated on to a few frames, and the bees by use of the division-board be confined to a small portion of the hive. This conserves the heat, insures better wintering, and is even more necessary to prevent Spring dwindling.

Again, the bees should remain quiet in the confinement of Winter, so that breeding is not desirable. In the absence of pollen or bee-bread they cannot breed. So I would have little or no pollen in the Winter stores. This is not a mere opinion, but a fact wrought out from experience.

2dly. No fact is better sustained than that bees must have a nearly uniform temperature to be able to surely survive in long confinement, with no chance to fly out. This is found to be from 35 to 45 degrees Fahr. about the hive. This temperature keeps the bees quiet. If the temperature rises above or falls below these limits the bees become uneasy, over-eat, become diseased and often die. If the weather permits frequent flights, then extremes of temperature seldom do mischief.

To secure this even temperature four methods are in use: The surest, as I have demonstrated by several years of experience, is a good cellar. This, though not superior for most of our seasons, is most to be recommended, as it is *always* safe. By a good cellar I mean one that preserves the uniform temperature between 35 and 45 degrees Fahr. from December 1st to April 1st; that is well ventilated, so as always to be sweet; one that is dark and quiet, and, perhaps, I should add one that is dry, though this seems not to be necessary. To secure the desirable temperature and good ventilation at the same time, nothing serves so well as sub-earth ventilation. Connect the bottom of the cellar by means of a four-inch iron or tin pipe with the stove pipe in the room above. This room should be one in which there is fire each day. The pipe from the cellar should join the pipe in the room above so high as not to interfere with the draft of the stove. Also from near the bottom of the cellar run an eight-inch tile five or six feet beneath the surface of the ground for a distance of 50 or 60 feet, when it is to rise to the surface. The end should be protected by a screen. This arrangement not only keeps the air sweet, but tempers the current as it comes through the earth, so that it is warm in cold weather and cool in the warm days of Spring. We have tried it in this region with the most gratifying success. An open cistern in the cellar is also excellent to temper the air. This has also proved very successful. A sweet running stream, if it could be secured so as not to expose the cellar, would be admirable.

Another method often adopted to secure uniform temperature is to bury the bees. It is often referred to as putting the bees in a clamp. In principle this is like a cellar, as both make the earth serve as protection. For a series of years I had no loss by this method, but one exceptionally warm Winter nearly half of the buried bees died, while all in the cellar, in fact all others, wintered well. That burying bees might be made a success I believe; but the bees are beyond the reach of examination, so if anything is wrong we do not know it, and so cannot remedy it; hence I hesitate to recommend this method, though with it I have had what would be called excellent success.

Packing under and about the hives with a thick layer of straw, or, better, with chaff, which is held in place by use of a box which surrounds the hive, is a third method which has been used with more or less success. The packing should be at least a foot thick, and a tube is so fixed that the bees can fly out at any time when the weather is warm enough. Thus the bees are left on the Summer stands and need no attention after they are once packed. Last Winter, however, proved that this plan would not answer on very cold Winters.

A fourth method, that of chaff hives, is the same in principle as the above. The hive is double-walled, and the inclosed space is filled in with chaff. In both these last cases a chaff pillow is placed immediately above the bees. I have always objected to these chaff hives as awkward, costly and inconvenient. Last Winter added—and unreliable.

There ought also to be abundance of young bees in the hive in the Fall. I have proved the importance of this by direct experiment. This is not only important in wintering, but it insures against spring-dwindling. To secure young bees in the Fall, the bees must be kept breeding through September. With the Syrian bees—I suppose the same is true of the Cyprian—or with a September honey harvest, this will be secured without extra pains. Otherwise, feeding a little daily throughout this month will continue the breeding.

A hole one-half inch in diameter cut through the middle of the combs to afford a winter passage is also desirable.

A thick layer of chaff held by porous cloth, immediately above the bees, above which there should be small ventilating openings, I think desirable, though not essential to success, even in the cellar. If chaff hives or packing are used the entrance should be nearly closed; in the cellar or clamp it should be left wide open.

Preparing for Winter—that is, seeing that there is abundance of honey, that it is in few frames, that there is little pollen, and that the brood chamber is confined to about one cubic foot of space, by use of the division-board—may well be done as early as the middle of September. Then, if there is a Fall harvest, the bees are still gathering and will be less cross. If there is honey to extract, it is thinner and more readily extracted. If the bees are to be fed, this gives a chance to have all capped up in good time. If storing is still going on, as is true with us this year, a few empty frames may be put next to the division-board, and removed when the harvest ceases.

I believe that the above offers all needed hints to solve the vexed question of wintering.

Ag. College, Michigan.

Field Crops.

QUACK GRASS—TRITICUM REPENS.

PROFESSOR W. J. BEAL.

This grass is also known as "Quick Grass," "Twitch Grass," Quitch Grass," "Couch Grass," and "Dog Grass." It belongs to the same genus as all of our cultivated wheats. It varies greatly. The spikes on thrifty specimens are nearly a foot long; on poor specimens, two inches or less. The leaves are flat, often rough on the upper side and resemble those of timothy—Phleum pratense. The grass varies in hight from six inches to three feet-and-a-half, depending on the soil and situation. It flowers in June to August.

Gould says, "The farmers of the United States unite in one continuous howl of execration against this grass." This is owing to its habit—well-known to most farmers—of sending out long underground stems (not roots) which rapidly extend the grass in every direction, especially in light soil. In good soil it will cut a fine crop of hay of excellent quality. In poor soil, the growth is short and small. It starts very soon after mowing and affords a good pasture where almost any other grass would do the same. It has undoubtedly been introduced at the East, but on the Western plains it is indigenous. Where it vegetates freely it does not seed, but when the stalks grow small and short, seeds are often developed. It is very hardy and adapted to a great variety of climates. When once introduced it comes to stay. Here is the great trouble; the farmer sometimes wishes to raise something else on his fields and Quack Grass stubbornly contests anything like extermination. It has been introduced into some parts of the South for the double purpose of furnishing feed and

SPIKELETS OF QUACK GRASS.—FIG. 498.

forming a turf to prevent banks from washing. It starts very early in Spring. There is no royal way to kill it. Thorough tillage will accomplish the object. I have killed several pieces in different ways without attempting to raise a crop at the same time. I have succeeded best in the following way. Plow late in the Fall, and go on to it as soon as possible after the ground thaws out—not waiting for the soil to settle. Cultivate well every two or three days till no traces are seen, which will usually leave time for a late crop of potatoes or rutabagas in the same season.

TOBACCO-GROWING NOTES.

There are several methods of hanging tobacco in curing barns, practiced by growers of seed-leaf tobacco. In the two more common methods the plants are either hung or strung upon poles with twine, or suspended upon lath by small wire hooks one end being driven into the butts of the plant stalks. In the latter method there are several important advantages gained, resulting in a saving of time and in securing the crop without damage to the leaves from sun-burning or mutilation.

The difference in cost of fitting a curing barn for hanging tobacco by the two methods—using lath and hooks, or twine and poles—is much more rapidly than in wet seasons, but it is a common error to harvest tobacco too green, which results in loss in yield and in a product too thin in texture and too light in color to suit the present fashion.

I cannot better express my views on this subject than to quote the remarks of Mr. W. W. Albro at a late meeting of the Chemung Valley Tobacco Club. He said:—Ten years ago cigar manufacturers could not find tobacco that was too thin and silky in texture. To-day they want a leaf that will stand a natural sweat and two or three artificial sweats, so they can obtain a color of leaf as black as my hat. The important question then is:—How can we obtain such a leaf? I answer, by ripening our tobacco. The longer tobacco stands in the field the more gum the leaf will contain and the heavier will be the yield per acre."

In times of drought tobacco will ripen prematurely. The leaf assumes the leading indications of maturity—a light mottled appearance—and sometimes the plant is attacked by rust, causing damage to the crop. If the needed rain comes in time these indications of ripeness will gradually disappear and the plant will again commence growing. When the rust appears so as to afford signs of serious damage to the crop, it is best to commence the work of harvest immediately, otherwise there will usually be no loss from allowing the plants to stand in the field until three weeks or even longer after the "topping" is done.

Chemung Co., N. Y. G. A. G., JR.

FOR HANGING WITH TWINE UPON POLES.

The following materials are required, costing at present about the amounts affixed.

462 poles 2½x5 in., 16 ft. long—7,700 feet—at $9 per M.	$69 30
Twine required for four acres	4 00
Total	$73 30

FOR HANGING UPON LATH WITH HOOKS.

210 poles 2½x5 in., 16 ft. long—3,500 feet—@$9 per M.	$31 50
4,000 lath, 1½x¾ in., 4 ft. long, @ $3 per M.	12 00
200 lbs. hooks @ $12 per 100 lbs.	24 00
Total	$67 50

Experience and good judgment are necessary to determine when tobacco is ready to harvest. Previously in my articles on this subject, I have stated that tobacco should be cut about two weeks from the time when the plants are topped. The inexorable laws of fashion are constantly changing and tobacco manufacturers demand a different leaf now from what they wished for a few years ago. At present there is a rage for dark cigars, and in order to meet the wants of manufacturers, growers must allow their tobacco to become fully ripe before harvesting it, which gives the product "body" so that it may be made of the desired color by re-sweating. For this reason I would extend the time to three weeks after "topping" when conditions allowed. Of course the length of time required to ripen a crop of tobacco will vary with circumstances. Some varieties will ripen earlier than others and in very dry weather tobacco will ripen

QUACK GRASS.—TRITICUM REPENS.—FIG. 499.

SMUT AND INSECTS IN WHEAT.

Mr. Stewart, in his "Remarks on the Wheat Number," on page 658, says that I made a mistake in my reference to smut, in the Wheat Number. Referring to Johnson's son's Encyclopædia of Agriculture, I find that the only kind of smut mentioned under that head is the Uredo segetum, to which various other scientific names are given. A part of the description of this fungus can apply only to the Uredo fœtida, for it is said that smutted grains of wheat are composed of about one-third their own weight of a green butyraceous, fetid and acid oil, and also of nearly one-fourth of a vegeto-animal substance similar to that which comes from putrid gluten. Besides, all the solutions which are prescribed for destroying the fungus apply exclusively to the stinking smut, for there is no other to destroy after the wheat has been thrashed. Now, the black heads which appear in wheat have no fetid odor, or, indeed, much odor of any sort. They are never seen except for a short time after wheat has been in bloom, for at harvest the black powder has dropped off or been blown away by the wind. In the work referred to above, smut balls are incidentally mentioned under the head of blight, where they are said to be analogous to the Uredo segetum. The term smut, as popularly used among farmers, millers, and dealers in wheat, applies only to fetid smut, for that is the only sort which concerns them, since, if not taken out, it injures the flour. I take this occasion to say that farmers, while they may be ignorant of the scientific names of things which come under their observation, frequently have more distinct ideas of the things than the books which profess to teach them.

Mr. Stewart, in his further remarks, says that Col. Curtis calls the midge the wheat weevil. Now Mr. Stewart has himself confounded this same midge with the Angoumois grain worm (Anacampsis cerealella). The maggots of the midge, or European wheat fly, do not eat out the heart of the kernels of wheat, as he says they do. They either eat the pollen, which prevents the kernel from forming at all, or else, if it has already formed, suck at it from the outside, which causes it to shrivel, or if too fully developed for that, blotches are made in its color. The maggots have generally disappeared at the time of harvest, therefore no midges proper would be found in the screenings from the fan, as Mr. Stewart says they are. Mr. S. has also mistaken a habit of the Angoumois grain worm for one of the Tinea granella. Dr. Harris, in his treatise on insects expressly states that the young moth worms do not burrow into the grain, as has been asserted by some writers, who seem to have confounded them with the Angoumois grain worms; but as soon as they are hatched they begin to gnaw the grain and cover themselves with the fragments which they line with a silken web. This fully accords with my own knowledge of them, for they and I are old acquaintances. I am familiar also with the midge and grain weevil; the Angoumois grain moth I have never seen. "This last," Dr. Harris says, "is somewhat similar in its habits to the Tinea granella, for it, too, spins a silken web, but it differs from that not only in its description, but in the fact that it lays its eggs mostly on the ears of wheat and barley in the field while they are still growing and are soft and tender; sometimes also on stored grain in the Autumn, from which it appears that it breeds twice a year. The little, worm-like caterpillars, after they are hatched, disperse, and every one selects a single grain into which it burrows, and remains concealed therein after the grain is harvested. Having eaten out the heart of the grain, they spin a silken web to divide the hollow lengthwise into two unequal

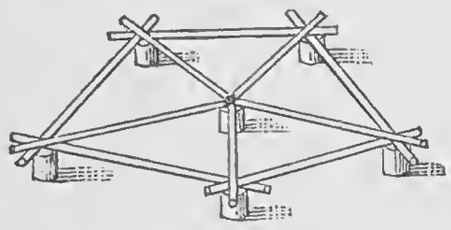
parts, the smaller containing the rejected fragments of the food, the larger cavity serving instead of a cocoon, wherein the insect undergoes its transformations. Before turning to a chrysalis it gnaws a small hole through the hull and sometimes through the chaffy covering of the grain, through which it can easily make its escape." This insect is said to have been very abundant at one time in the western part of New York and in Northern Pennsylvania.

Pulaski Co., Va. H. L. WYSOR.

Farm Economy.

STACKING CORN FODDER.

THE scarcity of fodder and its certain high price with a correspondingly high value of all the products of fodder, make it advisable to use every means for saving every kind of feeding stuff in the best condition. Corn fodder and fodder corn are rarely saved as well as they might be. Considered as coarse feed, "roughness" is the term usually applied to it. It is treated as though it were fit for nothing better than to be cast out and trodden under foot, as it is, for the greater part. But



FOUNDATION.—FIG. 500.

where corn fodder, or stover—as its right name should be—is justly estimated, its value is held to be but little less than that of "meadow hay" which is the mixed grasses usually found growing on old mowing land. Its relative value is taken at eight dollars a ton when meadow hay is $10. Now no farmer at any time can afford to waste feed worth eight dollars a ton, much less now, when meadow hay is worth $15 in many localities. There is waste in feeding corn fodder, no doubt, even when moderately fair economy is practiced in the using of it, but there is little care given to the saving of it and poorly saved fodder is always wasted in using, because it is damaged more or less.

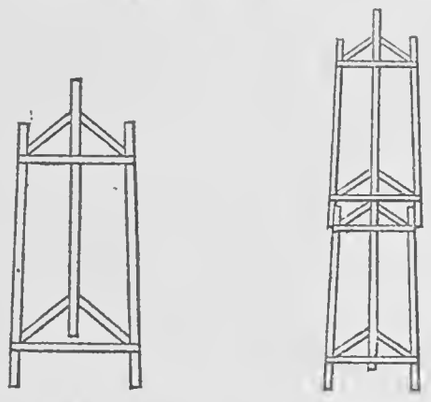


FIG. 501. VENTILATOR. FIG. 502.

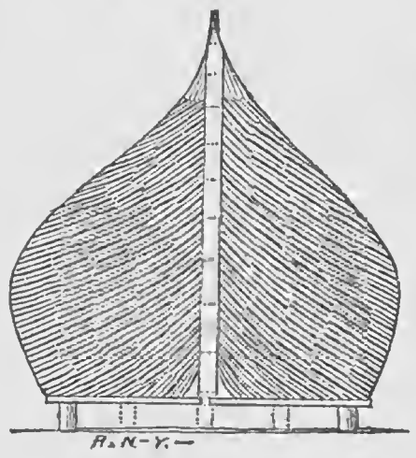
It is supposed to be difficult to save corn stalks in good order; that either they must be moldy from too close stacking or packing away in the mow, or dried and tasteless from too open stacking to let in the air to prevent molding. But they may be saved perfectly well, if but moderate care is taken with them. Stacking is by far the safest method, and good sized stacks the easiest and least troublesome. There are three requisites for keeping the stalks in good order; one, is good bottom ventilation; another is thorough central ventilation; the last is such an arrangement of the bundles in the stack that rain or snow cannot penetrate but must run off as the rain runs off from the roof of a shingled house. The following devices have been found perfectly successful in saving corn fodder and fodder corn in the very best, the driest, greenest, and sweetest condition.

First; a foundation is made for the stack. This consists of six blocks or short posts, or large stones, set in the ground as shown at Fig. 500. Poles or rails are laid from one of these to another, and other rails are laid crosswise to hold the bundles of fodder. This provides the required bottom ventilation. Second, some short pieces of rails, or light poles or stout laths or strips are made into triangular frames about 18 inches wide and four feet long as shown at Fig. 501. These are made sufficiently wider at the bottom than at the top, so that one will fit over the end of the other as shown at Fig. 502.

These being provided, the third and last part of the business is to build the stack as follows. A section of the ventilator is placed in the center of the foundation and a second one is fitted on to it. A lot of bundles of stalks are ranged on end sloping towards the center around the ventilator. Other bundles are laid on these, sloping still more and so on to the outer edge of the stack, the bundles lapping on each other, as shingles do on a roof. The center of the stack is built up by laying some bundles down lengthwise for the others to rest upon so as to get the desired slope. The stack is thus carried up with care to push the butts of the outer rows out, a few inches beyond the ends of the bundles under them, so as to widen the stack for about eight or ten feet up as shown at Fig. 503. This throws the drip from the top of the stack entirely off from the lower part and completely prevents even the ends of the fodder from becoming wet and damaged.



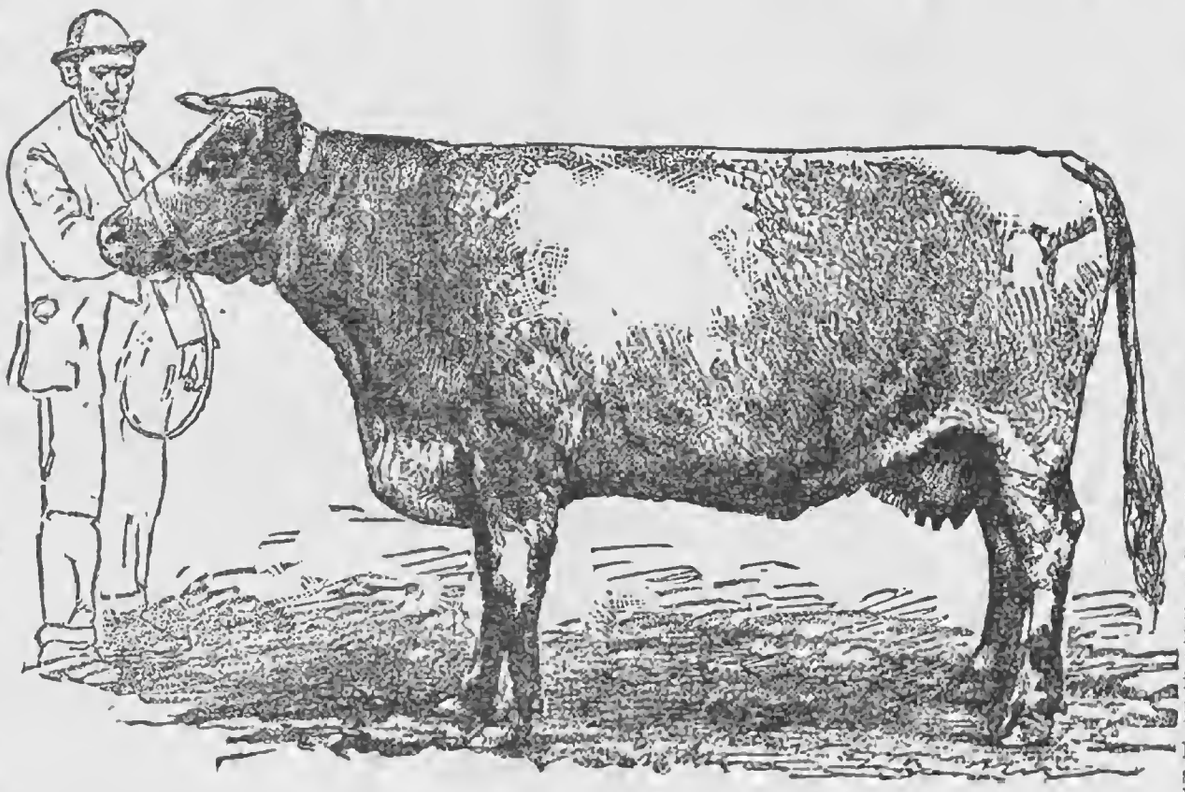
CORN STACK.—FIG. 503.

The stack is then drawn in gradually and the center bundles brought more nearly upright so as to get a good slope to the outer bundles to cause them to shed water. It is a good plan to push a few sharp-pointed, small poles down into the stack when it is two-thirds built, as this binds it and prevents it from lopping over as it settles. When the top is nearly reached the central bundles should be bound with straw bands and at the top this is done very firmly, the butts being spread out so as to cover well the tops of the bundles under them. A few sheaves of long rye straw should be spread and bound at the top to finish it off. This is a very important point, as, if water enters here, it will go through the whole stack, and yet there is no place so easily secured against the entrance of rain. When the stack is built, one should go over it with a long handled shovel or a heavy pole and beat down the outside so as to pack it well that the rain may run off easily. A ladder should be used in building the stack near the end of the work.

Cheap Ensilaging.

In reference to Mr. Bennett's communication under the above caption in our last issue, Dr. W. L. Faxon, Superintendent of the National Sailors' Home, Quincy, Mass., writes us under date of October 13:

"I think the result of my field silos very satisfactory. The one of last year was made in October just after the first frost. The trench was 84 feet long, 10 feet wide and 18 inches deep; posts were placed at intervals of six feet along the sides, and beginning the deposit of corn fodder on the bottom of the trench, the sides and ends were laid up with rough hemlock boards as the deposit increased. No especial care was taken to make good joints. The corn stalks were laid all lengthwise and tramped as hard as was convenient. To keep the sides from sloping outward they were banked with earth as the filling increased in depth. One, and the chief, object of making a trench was to keep the sides plumb as well as to obtain dirt easily to bank with. When the pile inside the posts was five feet deep it was covered with Eel Grass and about 18 inches of dirt were thrown on top.



SHORT-HORN COW, MATCHLESS 5TH.—FIG. 504.

The mass settled about one-third. The pit was opened December 1, and the fodder was found in good order. The last was fed out some time near the 10th of March this year. No rotting or molding was observed.

The 9th of last month (Sept.) I prepared a small trench 6x12 feet in the same manner. It was opened October 3. The fodder is about three feet in thickness and it is as perfectly preserved as any other fodder cut in small pieces. I think there is less heating, and one thing is very certain, namely, that four or five days may be taken to fill the pit with no heating to injure the fodder, as is the case when it is chopped.

Two things are to be observed—to keep the sides of the deposit plumb, and to put weight enough on the top—two feet of dirt are ample."

The Herdsman.

OUR ANIMAL PORTRAITS.

Short-horn Cow Matchless 5th.

IN this country Short-horn cattle are prized almost wholly for the rapidity as well as economy with which they lay on an unusually large quantity of beef, and that of a superior quality, with an unusually small amount of inferior meat as well as of offal either at an unusually early age or whenever in later life it is desired to turn them off. It is not often that they are used here for dairy purposes, although there are some excellent dairy herds of this breed in Vermont, New York, Illinois and Iowa, and grade Short-horns are still commoner in dairy sections; but other breeds, particularly the Jerseys, Ayrshires and Holsteins, are generally preferred for butter, cheese and milk. In England, however, Short-horns, generally pure-breds, but frequently high grades, constitute the majority of the dairy herds and are especial favorites with those who supply towns and cities with cream and milk. The readiness with which they fatten whenever for any cause it is desirable to turn them off for the butcher, is a strong recommendation to this class, in addition to their deep-milking capacity, which has been preserved and developed in England much more carefully and generally than in this country. Accordingly the dairy prizes at all the great English shows are generally won by representatives of this breed, a fine specimen of which we here present to our readers in the cow Matchless 5th, which at the late dairy show in London, England, took the Champion prize as the best dairy cow in the yard. She is the property of Mr. C. E. Tisdall who has long been prominently identified with the English Dairy Association. She was bred by Mr. Hobbs, of Maisey Hampton, Gloucestershire. who writes of her to the English Farmers' Gazette, from which her likeness has been re-engraved, that when newly calved she produced 20 quarts of milk per day, and yields a good supply through the whole season. The judges appear to have looked on her square, well-shaped udder as indicative of a good milk producer, although her last calf was dropped Nov. 1, 1880. She is by a bull of the Gazelle tribe. Of the engraving the Gazette says that though it fairly represents her, yet the lack of deep shadows and surroundings has given less impression of the depth and mass of the body than was produced either by the photograph or by looking at the living animal.

NOTES BY A STOCKMAN.

A TIMELY question for study is, can we prevent contagious diseases of live stock? Every year we lose millions of dollars through these diseases. Some years ago many thousands of human lives were lost by the same class of diseases, and men believed them to be visitations of Providence mysteriously inflicted upon the world for some evil doings. This was partly right in one sense, but wholly mistaken in another, as we have learned since the nature of these diseases has been understood. There was indeed—had it been realized rightly—a willful and wicked neglect of proper sanitary precautions through which these lives were uselessly sacrificed. Now when cholera, diphtheria, typhus, influenza, and other such fatal disorders prevail, we know something is very wrong about the wells, the cellars, the cesspools, the drains, or our personal habits, and we go to work and provide the proper remedies.

There is a close analogy between these human diseases and those of our domestic animals. In fact, they belong to the same class, are produced by the same causes, and are prevented by the same precautions. We have had Congressional Commissions and investigations enough, and to spare, were it not that these draw the public attention to the matter. The truth is, that no Commissions or other cumbrous devices of the Legislatures will reach the root of the matter. The owners of live stock must themselves go to work and use the very same methods to save their stock as those by which they save themselves.

The wonderful and mysterious principle of life is the same in mankind and animals. It is touched and affected and destroyed by the very same influences in each class. But with our stock it is a question of dollars and cents. It ought to be made a question of humanity and morality. "The righteous man regardeth the life of his beast." The converse being true, he who disregards it is unrighteous. Let us seriously think of this obligation which appertains to our higher position as holding "dominion over the beasts of the field" and make our rule humane and kindly. This is our duty and cannot be avoided without criminal responsibility.

Just here, I would ask the hundreds of persons who profess the moral obligation to be kind to the dumb beasts, why they misquote the above line and write "the merciful man is merciful to his beast." There is no such sentence, except as it is misused so frequently. The misquotation appears on the ambulance of the Society for the Prevention of Cruelty to Animals and a cruelty is inflicted upon every person who reads the misquotation and knows how wrong it is, and has his sense of the fitness of things outraged.

Besides, it does not put our duty upon the high plane it ought to rest upon. It is not a question of mercy but one of righteousness and therefore the responsibility is greater.

Now just at this time the frost has touched vegetation which is decaying and filling the air with a sickening odor in all low places and meadows. The nose is an instrument of warning, and scents danger afar. And there is danger in this frosted vegetation and decaying herbage. Myriads of germs of disease are rioting in this decaying substance, filling the air and water with poison. And soon we shall hear of cattle dying; of sheep pining; of hogs sickening; and the disease itself becomes a source of infinitely greater danger by the spread of the contagion.

Water is bad and unwholesome; wells are low and streams are partially stagnant. Dairymen are complaining of bad milk which is to be looked for under these circumstances, and this danger affects persons who use the milk. If we wish to prevent loss and fulfill our moral obligations, we must look to every source of disease and avoid it. Every farmer should make a study of the nature of these diseases, so that he may be prepared to act with understanding and reason.

Doubtless many an honest dairyman (do not smile, gentle reader, for there are as many honest men among dairymen as among other classes) has been brought to grief by that delusive test of milk, the lactometer. I would guarantee to show any reasonable jury by a few tests in their presence, how skimmed milk may appear better than rich milk, and the richer the milk the poorer it shall seem to be, when tried by the lactometer. But a curious case of an honest milkman recently came to light. He had a cow. This cow was peculiar and gave very poor milk. The cow's milk on testing, was declared to be watered and the man was fined. But, like a brave man, he fought in his defence and appealed against the verdict. A chemist analyzed the milk taken in his presence directly from the cow and proved it to be abnormally rich—in water. The man proved his innocence and escaped his unmerited punishment. No doubt many similar cases have occurred in which men have borne undeserved disgrace and have been unjustly convicted by the lactometer and the prejudices and ignorance of a jury.

This story has a moral, which is, that every dairyman should test his own cows by the cream gauge, as well as by the lactometer, so that he may know his bad and his good cows, and understand how to defend himself if unjustly accused.

Dairy Husbandry.

A CREAM PARTY AT KIRBY HOME. STEAD.

A CREAM party was held on September 30, at Kirby Homestead (the quarters of our esteemed friend, Col. F. D. Curtis), which everybody said was both pleasant and profitable. People understood why it was called a cream party when they saw the long row of glass cans ranged on a temporary shelf under the trees, filled with milk, with the cream all up, some of it thick and some thicker, each one of the cans containing a portion of the morning's milk of one of the cows standing in a row close by. Some of the cows had the record they had made all printed in large type and posted by their sides. Then there were churns, from those of a primitive character up to the best, and a Moseley creamery was in operation, sending up the cream so rapidly that in three hours it was all up to the top of the can. There was butter in the bowl, and butter in the churn, just churned, in the granulated form, the best for salting and draining out the buttermilk. Fodder corn 12 feet high stood around, leaning against the huge shade trees, and a big pile of big roots all helped to explain what a cream party meant.

If anybody had any doubt, it was made clear when the bell rang in the afternoon and the crowd of visitors assembled around the front piazza and the speaking began. The host thanked every one for coming, and said he had been "worried" because in his vicinity there was not butter enough, and what there was, was not good enough. He wanted to talk to his neighbors and farmers about it. The average yield per cow, he said was not half as much as in Vermont; we got less than 100 pounds of butter, they got 200 pounds. Better cows, more feed, less work and better butter were necessary if any money was to be made. Cows could be improved by breeding; some had done it. Mr. B. Callaghan's cow, half native and half Ayrshire, on exhibition, proved this, and so did the cows of Alexander Davidson, the Rev. C. W. Backus and Geo. M. Heaton. The herds of the last three had been bred from Jersey stock. Mr. Callaghan's cow had supplied his family with milk and cream, and made 28 pounds of butter in 10 days, and 410 pounds in a year. When five years old, she had made 64 pounds of butter in June; and when six years old, 66 pounds. Mr. Heaton's half-bred Jersey had made in a week, when two years old, 9¼ pounds of butter; when three years old, 12 pounds 6 ounces; and 15½ pounds when six years old, the last trial in April before being turned to grass. Cows should, he said, be tested, every one, and the poor ones turned into beef. As soon as the flush of feed is over, extra feed should be given. His cows had given one-third more milk in dry weather by feeding four quarts of wheat middlings daily, which cost four cents. In hot weather cows will stay out in the sun and fight flies only long enough to satisfy the cravings of hunger. All they eat in such a case will not make much milk. They must be tempted to eat more in the stable, and all of this extra feed will make milk.

Under the old system of taking care of milk there is too much labor. Farming had been made much easier by improved implements, and so had butter-making by ice setting and the creameries. This was not all: when milk was set in pans in warm weather, it would not all be ready to skim at the same time, and some of the cream would become rancid; this would in time make the butter rancid, for although the germs of putrefaction in it may be only in one pan of milk, or one skimmer of cream, yet, like leaven, it would affect a whole tubful of butter. This was the reason why there was so much poor butter and so much disappointment to hard-working housewives when the butter was sold. The changes of atmosphere and conditions, warm cellars, etc., were generally such that the butter would be poor. With ice or cold water the temperature of the milk and cream could be controlled and both could be kept sweet. He believed in sweetness. Fermentation meant putrefaction, and this was decay. People would not buy, at a first-class price, butter on the way to decay.

Mr. T. B. Clark, a practical Vermont dairyman, who makes 25 cows average over 200 pounds of butter each every year, who had been induced by Col. Curtis to be present, then explained the creamery process, and the handling and care of the cream and butter. He also told the farmers how he manages his cows. He went from the small pan system to that of the large, shallow pans with water running around them. This was better than the small pans, but when the deep-setting plan was introduced he went into that, notwithstanding he had built an expensive milk-house for the other. He found ice much better than water, as the former gave perfect control over the milk, while the latter did not. One was a success, the other was a partial success. He fed his cows all they would eat, as there was no profit in poor cows, or those poorly fed.

Rev. Mr. Parkinson made a pleasant address on the benefits of social gatherings and discussions among farmers. They should meet oftener and talk about just such topics as had been elucidated. A farmer was not wise or sensible who stood aloof from any improvement, or the opportunity to improve. The old rut led up hill too much. He should go home wiser and grateful.

Dr. Geo. A. Stuart, a local physician, read an instructive paper on contagion from milk and its relation to health and disease, and stated that typhoid fever and other diseases had been transmitted in milk. Milk was susceptible to taint and contagion, and required clean and healthful surroundings. Cows could also convey disease through their milk if the food or water they consumed was foul or infected, or even the air.

The ample hospitalities and the charming sunshine served to make the greetings, if possible, more cordial. May there be more such!

A RURAL READER.

The Swine-Herd.

MY PIGS.

I AM experimenting in growing pork, and have taken, for the purpose, 12 pigs of the Poland-China breed. I have provided dry, sheltered sleeping quarters under a low, temporary shed covered with a hay roof, and adjacent to a covered alley-way, filled loosely with hay, under which they can burrow to avoid the hot sun or the cool air of night. The pigs are, one-half of them, three months old, and one-half, two months old. They have been "altered" and weaned in the most successful manner, and as they are all growing in a remarkable degree, I will describe my management of them.

I have a long, shallow, V-shaped trough outside of the regular hog-yard (which is 80x100 feet inclosed by barbed wire only) and beside the trough a barrel for swill. I have a lot of coarsely ground corn, some wheat bran, and some wheat shorts; these I mix in the barrel, and manage to have the mixture sour all the time. I put two common pailfuls of it to 40 gallons of cold water, but I do not always make the swill of the same proportions of the three kinds of feed; in fact, I aim to keep up a constant variety in their feed by continually varying the proportion. For instance, calling the corn No. 1, the bran No. 2, and the shorts No. 3, I begin *to-day* by making a mixture of six parts of No. 1, three parts of No. 2, and one part of No. 3, *to-morrow* it will be 5, 3 and 2; the next day, 4, 3 and 3, the next day 3, 4 and 3, and the next day 5, 3 and 2, and so I "swing around the circle." By this means I keep their appetite continually active.

In addition to these rations, they have, three times a day, sour milk, to the amount of a pailful each time, apart from their regular swill. They get their swill at five and nine A. M., at noon, and at four and seven P. M.—in all five times a day. All day they run in the corn field, where there are many cool, damp places and plenty of green herbage to nibble at. Although I give them at each feed all they will eat, they come promptly to the trough when called, and eat as if it were their first meal, and feared it would be their last.

They are remarkably sleek, lively and thrifty, and their growth can almost be noticed from day to day. I am as regular as the clock in feeding them, and believe it to be a *sine-qua-non*. I am sure the variety I make in their swill is a most important matter, as well as giving them their liberty, both night and day. They are very sociable, and never squeal, except when following me to the feed trough, and this is another point I aim at. As the "quiet sow gets all the swill," I am educating these pigs, as I did their mothers before them, to be quiet, so that each one can get all the swill it wants. I do not pretend to offer the treatment as particularly new, but I do assert that it is rare—too rare altogether.

"My pigs" get feed enough at each feed; get it often enough; get variety enough; get exercise enough, and are content. Under these conditions they cannot help growing; they have nothing to squeal for, and their fine condition proves my course to be the correct one. I recommend this plan absolutely to all who wish to enjoy pork raising; as to me, there is real enjoyment in seeing success follow full feeding, and no sign of surfeit to follow.

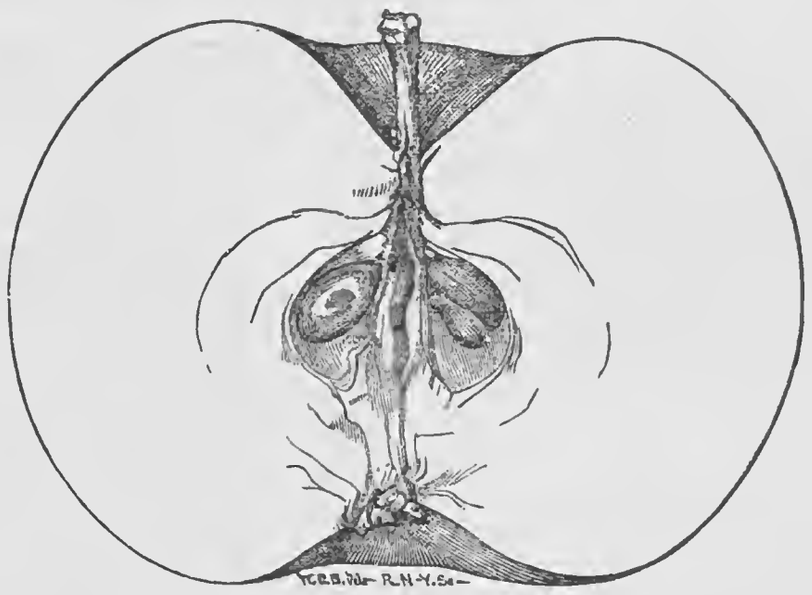
S. RUFUS MASON.

Pomological.

JERSEY HAWTHORNE APPLE.

E. WILLIAMS.

THE "Haththorne," as old people used to call it, is a local apple in this vicinity and has not, as far as I can learn, been much disseminated. The oldest, and I suppose the original, tree is still standing in West Orange, N. J., and was in 1840, to use the language of the gentlemen who then purchased the farm, in the very prime of life and vigor and producing abundantly. I have not been able to find any other trees now standing, that did not emanate from this one by grafting. It has generally been supposed to be identical with the Hawthornden of Downing, an apple of Scot[illegible] origin, and I, too, accepted this story until I fruited the latter and found it entirely distinct. The old tree bears no evidence of ever having been grafted, and I can find none that leads me to suppose it is not a seedling. The fruit has been frequently exhibited during the last dozen years without being identified with any known variety, and to avoid confounding it with the foreign variety I have felt justified in calling this "Jersey Hawthorne."



JERSEY HAWTHORNE APPLE.—FIG. 505.

The trees are of vigorous growth and the limbs are elastic (just the reverse of R. I. Greening and such rigid varieties), making a full round head. It is a profuse bearer in alternate years. Fruit medium to large, round, quite regular, flat, usually very fair and handsome; skin greenish-white, becoming light-yellow at maturity, often with a light blush, on the exposed side, slightly sprinkled with gray dots. Stalk three-quarters of an inch long, rather slender, set in a deep cavity. Calyx closed. Basin moderate. Flesh, white tender, crisp, juicy, subacid, pleasant. A handsome apple of fair quality. Season, October to January.

Changing the Bearing Year.

A neighbor some years ago had a tree of Dutch Mignonne the fruit of which did not suit him though it bore abundantly on the "off" year when apples were desirable. He also had several trees of the Jersey Hawthorne doing well. I remember one season he realized $4 per barrel for some of the fruit. He grafted his Dutch Mignonne with Hawthornes and when it came to bear it took on the Mignonne habit of bearing in the "off" year, so that now he has Hawthornes every year. Will not this fact score one on the affirmative side of the question "of the influence of the stock on the graft"?

Montclair, N. J.

Miscellaneous.

What Others Say.

DESTROYING THE CANADA THISTLE.—At a late meeting of the Markham (Canada) Farmers' Club Mr. Slater made some suggestions as to the destruction of the Canada Thistle. We find the report in the Toronto Globe. He had killed everyone of them by repeated cultivation. He and his gardener, Mr. Burgess, had started experimenting with thistles; had found that a dense shade would kill them, but that merely cutting off the tops would not. As the result of the experiments he had become fully satisfied that three or four cuttings just under the surface were sure death to thistles. So he purchased a new set of shovel teeth for his cultivator and ran that over his field. It cut the thistles and left them standing, but in a few hours they wilted beautifully and dropped. In ten days they were up again and received another dose of the cultivator. This time the thistles grew again, but weak and soft, and one more cutting finished nearly every one of them. He expected that a crop of barley and clover would finish off whatever seedlings might spring from seed left in the soil. For thistly land from which a grain crop had just been taken, he would first go over the ground with a grubber to loosen it and give the weed seeds a chance to germinate. Then he would run his scuffler and cut off the weeds; let the seeds grow again and cut again. One of the greatest mistakes a farmer could make was to plow under land foul with seeds without doing something to germinate the weeds. He thoroughly believed that plowing was of no good against thistles. Besides, the saving effected by using a cultivator instead of a plow was immense. A man can cultivate three times as much as he can plow. On the ordinary farm, in two or three days a cultivator will go over all the summer-fallow there is. Any farmer can find time to do this, while farmers could not and did not find time to plow their fallows. So that even if plowing was as effectual as cultivating, which it is not, cultivating would be best.

THE YORK IMPERIAL APPLE.—If ever a fruit did better in Eastern Pennsylvania than the York Imperial Apple in the few years it has been tested, then it must be as nearly perfect as we can expect. It is as regular in bearing as the return of the seasons, as large as the favorite old Pennock, and as handsome in color as was that variety in "the good old times" of our fathers; it has no imperfections to speak of to mar its glossy red surface; and in quality it has just that nice commingling of acid and sugar sure to please the majority of judges of good fruit. It is not so rich as the Smokehouse, and yet it is by no means deficient in flavor; nor so spicy as the Newtown Pippin, although it possesses a fragrance peculiarly its own. In the orchard, the outline of the tree is not to be commended, and yet it is a remarkably healthy and vigorous grower, with rich, dark green foliage. It will not produce so many apples as Smith's Cider, but there will be more bushels per tree; and as regards value, the York Imperial is immeasurably its superior, and always commands a much better price. So says Josiah Hoopes in the N. Y. Tribune, the agricultural department of which is, as we view it, ably and conscientiously conducted. Since reading the above we have made inquiries as to where this apple thrives best. According to the record of the American Pomological Society, the States are Pennsylvania, Maryland and Virginia. Favorable reports have also been made from some parts of New York.

CROPS ON LONG ISLAND.—The Democrat of Bellefonte, Pa., has the following: "Center County farmers are not only just but generous, and would not think of rejoicing over any reported failure of crops, consequent upon the drought in other sections of the country. Nevertheless, "Misery loves company," and we confess to being a little less uncomfortable on the score of the discouraging emptiness of our barns and cribs, when we learn that we are "no worse off than our neighbors" of other counties and other States. The RURAL NEW-YORKER comes up smiling with an amusing cartoon of "The Long Island farmer gathering his crops." His face wears a most forlorn expression as he trudges homeward with a basket upon one arm, containing his entire crop of potatoes and garden truck, a small sickel in the same hand, and in the other his whole grain crop, done up in a single sheaf of wonderfully slender proportions." We would say that although all late crops (especially corn) have proven comparative failures, the Long Island farmer was blessed with very heavy crops of wheat, oats and hay and has, in fact, little cause of complaint.

CHINA AND CALIFORNIA.—Hon. John Bidwell says, in the Pacific Rural Press (Cal.), that the great want of a California farmer is a fair price and an adequate market, there being no question in his mind about his being able to produce the greatest abundance. No market can be deemed available unless products can be transported to it with, at least, a small margin of profit. After giving the statistics of the grain crops of the State, he refers to China as a market: "We have a treaty with China and, as I understand, we have ample control of Mongolian immigration. All is satisfactory. Why may we not lay hold of China and convert that vast empire of more than 400,000,000 people into a boundless and never-failing market for all our surplus flour? I do not mean to compel the Chinese to swallow our bread at the cannon's mouth. But lay hold of China by the stronger and more enduring ties of friendship. I can see no reason why we should perpetuate the senseless abuse and prejudices for which politicians and demagogues have in

the past been so largely responsible. We on this coast are too needy, and our country is too powerful and too magnanimous to give any uncertain sound on a question of such vital moment to her Pacific border. The shipments of flour to China began with 96,000 barrels in 1865. For the present year they have been at the rate of nearly 300,000 barrels. But China takes more than flour from California. During the last month, August, the exports of merchandise from San Francisco were larger to China than to any other foreign country, England excepted.

HERE I must mention an extraordinary event which took place in a sister's poultry-yard. She possessed some very fine cherry trees of the best of all kinds for cherry brandy, and the cook had been hard at work making a large quantity. The cherries, after being soaked in the brandy until all their flavor was drawn out, were thrown by one of the servants into the poultry-yard. An hour later, every dweller there was furiously and frantically drunk. The turkeys went running and tumbling all over the place, the ducks tried to stand on their heads, whilst the chickens ran backwards. No harm seemed to come, however, and after an hour or two the drunken fit wore off, and the fowls came to their senses—Lady Gay, in the Live Stock Journal of England.

A REPORT of the late British Dairy Association says that the goats were placed in the body of the hall, under the gallery, where they were far better situated than last year. The demand for these animals was plainly evidenced by the number of "Sold" cards over those exhibits which were for sale, some fetching very high prices—in the case of the milking prize winner, £7; others mere reasonable sums.

BUT while the Canadian farmer is toiling from sunrise to sunset, says the Hour, his rulers are piling up a debt the payment of which must eventually come out of his own pocket, so that, granted that he has purchased his land at a fabulously cheap rate, he finds at the end of the year that he has to pay his share of numerous assessments which he had not previously taken into account. While the United States are busily paying off their obligations, the Dominion is clapping on more financial sail than she can or ought to carry. Several shrewd English papers prophesy that her commercial collapse is only a matter of time, and that a not very remote one.

SIX Nevada widows, each worth over $300,000, have formed a compact and solemnly agreed to take no men but editors for second husbands. The reason for this is that they know editors are above pecuniary considerations, and will only wed for love. And we wish to add that every editor in the land considers all these ladies as among the loveliest of their sex and highly intellectual.—Boston Post. . . . . That kind of inane flattery which, in the popular slang, is known as soft soap is made of very powerful lie. . . . . You can't make good out of evil any more than you can skim the cream off the top of a pan of milk and then turn it over and skim it off the bottom. . . . . We hope, says the Rural Home, that the time will soon come when our agricultural societies will be satisfied to depend upon the attractions offered by a good exhibition of farm products, stock, machinery and manufactured fabrics, without bringing outside and questionable attractions to *draw*. The RURAL NEW-YORKER hopes so too. . . . . When Mr. Moody held his celebrated revival in Chicago, he was asked which class of persons he had the most difficulty in converting. He promptly replied, "Newspaper men." . . . . . The London Live Stock Journal says that no one now doubts that the high excellence of Scandinavian dairy products which have so often beaten their own out of the market, is the direct result of the Scandinavian Dairy Schools. . . . . It is not generally known how very fond fowls are of roots; and a few mangolds, turnips, carrots, or beet roots are well bestowed on them, for during Winter poultry frequently flag for want of green food, which can in this way be easily given. . . . . "Now we come to the neat little Ayrshires; and if the breeders of any other kinds of stock want to know what sort of an udder a cow should have, let them come to the Ayrshire classes and study the models of perfection to be found there, not in isolated instances, but in almost every instance."—London Fanciers' Gazette.

THE Mark Lane Express (London) says that there never were such great discrepancies in estimates of the American wheat crop as there never were so many speculators having command of journals in the United States as there are now. Every newspaper report is looked at with suspicion, and it is even doubtful whether the official estimates are not influenced by the machinations of speculators operating on those who supply reports to the United States Agricultural Department. . . . . Finally, our great hope for the future—our great safe-guard against danger—is to be found in the general and thorough education of our people, and in the virtue which accompanies such education.—Garfield. . . . . If there be one thing upon this earth that mankind love and admire better than another, it is a brave man—it is a man who dares to look the devil in the face and tell him he is a devil.—Garfield. . . . . Poverty is uncomfortable, as I can testify; but nine times out of ten the best thing that can happen to a young man is to be tossed overboard and compelled to sink or swim for himself. In all my acquaintance I never knew a man to be drowned who was worth the saving.—Garfield. . . . . President Arthur will have his hands full. He must decide whether a half-dozen swindlers shall be allowed to take possession of the country, or whether it shall be controlled by the people.—The Hour. . . . . As an indication of the excessive drought in Pennsylvania, it is remarked that the fish in the Juniata River raise a dust when they move about. . . . .

You must either soar or stoop,
Fail or triumph, stand or droop;
You must either serve or govern,
Must be slave or must be sovereign.
Must, in fine, be block or wedge,
Must be anvil or be sledge.—Goethe.

Everywhere.

RURAL SPECIAL REPORTS.

Arkansas.

GARDEN, Clark Co., Oct. 11.—The drought has wholly destroyed all the RURAL seeds. My Branching Sorghum never put out a single panicle. We have had the severest drought I have ever known and most of our crops are total failures or nearly so. I gathered six tubers from my White Elephant—the largest about one inch long. H. M. Y.

Canada.

GLENMORRIS, Brant Co., Oct., 10.—The weather in this part, in common with many other parts of the country, has been very dry the last four months: we had no rain of any account in August or September, but we have had some fine showers since October came in. The turnip and potato crops are poor; pastures bare. Oats, barley and peas good. Wheat a little below the yield of the last two years. Hay good. The RURAL'S seeds all grew finely. I cannot boast of such a large yield from the White Elephant as some of your correspondents; neither are they white but of the color and size of a Rose potato. The Branching Sorghum would have ripened seed, I think, if the Fall had been favorable. The carnations were beautiful. I took a prize for them at our local fair. The Cuthbert Raspberry plants grew finely, kept growing all Winter and now stand nearly six feet high, having borne a few berries last Summer. The early Amber Sugar Cane seems to do well in this part. I procured a package of seed from Cole & Brothers, seedsmen, Pella, Iowa, and tried it this year again, having grown some last, and it has done well, considering the dry weather. Some stalks measured over ten feet in length. I showed the cane and sirup at our Provincial fair and took first prizes on both; but nothing took my attention so much as the Cuban Queen Watermelon advertised by the RURAL. Having procured 15 seeds from Burpee of Philadelphia, I raised some of the finest ever seen in this part; but, alas! one fine night the biggest of them all took to their legs or to those of some rascally thief and left. R. R.

STRATFORD, Ont., Oct. 12.—At the North Perth Agricultural Society's Fall exhibition, which opened September 15, I showed a sample of the White Elephant Potato grown from seed received from the RURAL. I had not the quantity required to take a premium, but the judges highly recommended the potato, stating that in their opinion it was a most desirable variety for general cultivation, and as there is a demand for a good *late* potato, there being plenty of good early ones, it is likely to become a standard variety. The yield of the White Elephant was good, although, owing to the extremely dry weather, it was not so large as some I have seen quoted. I may state that at the same fair I exhibited sweet potatoes grown at Stratford, several of which weighed upwards of a pound each. Pretty good for so far north, is it not? C. W. Y.

Connecticut.

STRATFORD, Fairfield Co., Oct. 8.—In the RURAL of October I you hoped that I had cut some of my sorghum off and would report the result. I did cut some of it off about August 15, and the second crop had grown to the average hight of two feet six inches when the frost cut it; it should have been cut earlier in the season the first time. I counted the stalks in two hills of the first and second crops; one hill of the first crop had 12, and one of the second crop 22 stalks; the other hill of the first crop that I counted had 26, and the second crop 30 stalks. I think it a succeses as a fodder plant. R. W. C.

Dakota.

JAMESTOWN, Stutsman Co.—I had pretty good luck with the RURAL seeds; the asparagus is doing very well; the Washington Oats did not stand the dry weather so well as some common oats I had beside them. The Sorghum is a rapid grower. I cut mine three times, and fed it to the cows—they ate it greedily. The White Elephant I got was frozen before planting time. G. G.

Illinois.

ONARGA, Iroquois Co., Oct., 14.—We have had no frost here to hurt anything yet. It was very dry all Summer until the middle of August. After that time until the first of October, we had a good rain once a week. Since the first of October it has rained one-half the time and the ground is very wet, but the pastures are splendid. No apples and but few potatoes in this county. Corn half a crop; hay a fair crop; oats heavy. I dug the White Elephant Potatoes a few days ago, and had 82 tubers, large and small; quality first-class. I have two fine rows of Branching Sorghum 10 rods long very full of good seed. It stands 10 feet high and is green yet. The first of August I cut several hills; it was five feet high at the time. It has made a second growth of six feet in hight. A part of it was cut the second time on September 15; the third crop is two feet high now: the second growth has 40 stalks to the hill. H. H. C.

WATAGA, Knox Co., October 9. — When the RURAL seed came last Spring they were all right as I supposed. One small White Elephant potato looked all right, so I put it away where I knew it could not freeze until I wanted to plant it; then I found nothing but the skin with a thin watery matter in it, so I suppose it was frozen when I received it. The Sorghum seed came up well and grew as fast as corn. It was planted about the first week in May. It had from five to twelve stalks from one seed. About the middle of August it was eight to ten feet high. I cut a few stalks to see about its sprouting. The cut stalks grew well. Some of them are three feet high with seed heads out. The seed was nearly all ripe two weeks ago, and I have saved a good quantity. I cut the last 10 days ago and it has all started to grow again. I shall plant more of it next year. I fed it to my horses, and they were very fond of it. The oats did not nearly all come up; they rusted and smutted badly. I saved a little over a pint, some heads were 14 inches long. The asparagus did not come up well on account of very dry weather. This also caused potatoes to be a failure. The flower seeds my wife planted, but on account of dry weather and too many chickens they did not do much. A SUBSCRIBER.

Iowa.

ALGONA, Kossuth Co., Oct. 11.—We are having a very rainy season and farmers are much behindhand with their work. Crops are light in this county. Our White Elephant potatoes, dug to-day, were Elephants both great and small, and Elephants with tusks. We received our Elephant late in May. It was small for an Elephant, but had 15 eyes. It was planted about the 24th in common garden soil that had not been manured this year. We had 30¾ pounds, with common culture. We received our flower seeds so late that we did not plant them this year, except the pinks, and they came up well, but the 'hoppers ate them up after I had put them in the garden. I saved four plants which I have in the house, they have not bloomed yet. Two of the pentstemons I got last year bloomed this year and were nice. A. C. H.

KEOSAUQUA, Van Buren Co., Oct. 14.—Our long drought is now succeeded by almost continuous rain. No frost yet. Pasture good. Oat crop generally good, and hay also. Wheat poor. Corn about half a crop. The White Elephant sent me did well. The Rural Branching Sorghum is doing finely also. The Washington Oats did not have a fair trial. D.S.J.

Kansas.

FONTANA, Miami Co., Oct. 9.—After a protracted drought all through August and July rain fell on October 1, and thoroughly saturated the ground and raised all the brooks and rivers past fording. We had a big rain last night again. The acreage of wheat is very small in this county. The White Elephant Potato as well as the asparagus and flowers came up well, but the drought injured the potato crop, so that there wasn't half a crop, but I dug 90 White Elephant potatoes. W. P.

AGRICOLA, Coffey Co., Oct. 12.—We have had a very dry season; no rain from July 12 until September 30. My White Elephant Potato made me one-third of a bushel of tubers. The Rural Branching Sorghum was eaten down by my neighbor's horses; it came up again, but the weather was too dry for it to make much growth. T. W. T.

Michigan.

SOUTH HAVEN, Van Buren Co., Oct., 11.—The Rural Branching Sorghum nearly all came up and grew well. Now what has not been cut stands about six feet high and is a dense mass of growth, one hill having 28 fine stalks. I cut five or six hills in August and it is now four feet high. I counted one hill that contained 31 stalks. It is undoubtedly an excellent fodder plant. The asparagus did well. I have 90 plants. I drilled the oats and had three large sheaves; have not thrashed them yet. They rusted. My potato was very small, weighing less than two ounces. I planted it in good soil one eye in a hill. I dug 179 ounces of large tubers, making 89½ bushels to one. Those dianthus seeds nearly all grew and among a large collection of flowers they stand unrivaled; all colors were represented, double and single. A few have not blossomed this season. I do not think the sorghum will ripen in this latitude. I like the RURAL ever so much. O. B.

Minnesota.

STOCKTON, Winona Co., Oct. 10.—I send you to-day, one head of Rural Branching Sorghum, that you may see how it ripens seed in Minnesota on the 44th parallel of latitude. [The head is fine and the seeds fully matured. EDS.] The seed was planted May 6, and received ordinary corn culture. It grew to a hight of eight feet, and when it was cut off sprouted again. All of it blossomed and nearly half of the seed matured before I cut it down more than a week ago. I had 75 hills and am convinced it is an excellent fodder plant. The White Elephant Potato was divided very carefully and made 18 pieces; it was planted May 6, one piece in a hill, eighteen inches apart; it received the same care as my other potatoes and was dug Sept. 21, and yielded 216 tubers which weighed 80 pounds; the largest tuber weighed one pound 11 ounces; six of them, six pounds nine ounces. They are smooth and of handsome shape and mostly of large size. The Washington Oats were drilled May 6, and made a very handsome growth; but just as the heads began to form some cattle got into the field and ate the tops off. Other stalks sprang up and formed heads, but being so late they were struck by rust and not a seed matured. I was very sorry to lose them as I prized them highly. The soil upon which the foregoing were grown was ridge land and the seeds were the first crop—no manure of any kind. I have a nice lot of asparagus about 20 inches high, and the pinks are and have been for two months a thing of beauty. We have had but one frost yet. We are having a rainy Fall, and farm work is much delayed. Crops were an average, except wheat, our main crop, which was injured more than usual by chinch bugs. Prices are high. We like the RURAL very much and think the "Condensed News" the best *unpatented* article in the country. W. E. B.

Missouri.

CHARLESTON, Mississippi Co. Oct. 10.—Corn half a crop; potatoes two-thirds; wheat about five-eighths. There will be less wheat for next year, more potatoes, and about the same area of corn. Up to the present time wages are disproportionate to prices of produce in this section. M. V. R.

KANSAS CITY, Jackson Co., Oct. 16.—The late rains have had a good effect in Kansas. Along the Kansas River from Topeka to Kansas City I noticed that the grass had started again, and that Winter wheat was all up and looking remarkably well. This was in marked contrast to the burnt-up foliage on the trees. This rain 30 days earlier would have had a very beneficial effect upon the corn crop. The drought continued right up to the time of husking, and the crop falls short of the report given in your Western correspondents' letters last week. I see that friend Richard Goodman, Jr., in RURAL of October 15, also takes up the cudgel for better committees on live stock at our fairs. Keep it up, and in time the State associations will come to it, and a premium will amount to more than the money or medal that goes with it. W. H. K.

New Jersey.

MONTCLAIR, Essex Co., October 11.—Our drought may be said to have terminated, for we have had slight showers that have laid the dust and dampened the surface sufficiently to start the weeds and bring up fodder corn planted nearly three months ago. Two months of foddering already make a gloomy outlook towards Spring. But little grain has been sown yet and little plowing done—ground too dry and hard. Notwithstanding a three hours' rain on the 3d, it is astonishing how little it penetrated. A gentle, steady 24 or 48 hours' rain is wanted to wet the earth to any depth. A cold wave struck us on the 4th, sending the temperature down to the ice-making point. A fall of 50 deg. in 24 hours brings fires in demand and kills all tender vegetation. Potatoes about one-third of a crop; the bottoms of the hills have not been wet since the vines came up.

A splendid promise but a great failure. Won't they be high before next planting time! W.

New York.

CLYDE, Wayne Co., Oct. 12.—The first cold snap of Autumn occurred on the 4th. Quite a considerable surface of water and damp ground was frozen over, but the high wind prevented a frost. However, all ungathered grapes, etc., were destroyed by a hard frost on the night of the 10th. From about the time of the shooting of the President no rain of any account fell here until the day of his funeral, since which we have had frequent storms. There was not enough rain to start the loose kernels on the ground and in the heads of wheat scattered on the harvest fields until the last day of September; but the soil was not penetrated to the depth of the plow until the 4th inst, since which considerable plowing has been done, and sowing has been continued up to the 9th. Some farmers finished sowing the first week of September, in the dust; others continued at different times to the 20th and 25th, and others waited till after the rain came. The early-sown came up at once in moist places in some fields, and evenly on summer-fallows. The remainder of early pieces are now all up, after lying on the ground 30 days—every kernel growing. Now, is there such a thing as the malting of wheat after sowing, except, perhaps, here and there a few kernels? All observers know that very soon after the "sprout" starts upward from the base of the kernel, the roots start from the same place and are continually piercing deeper into the soil. Hence, how is it possible that a kernel should malt, except in some instances where the moisture of the soil evaporates very rapidly soon after the blade sheets up, before the roots start, or where the only dampness for the depth of a foot happened to be at the surface of the ground around the seed, which, swelling the kernel and starting the blade, and the roots shooting downward only to pierce into the dry dust farther, would certainly end in the death of a plant if a severe drought continued. However, it seldom happens that seed sown in the ground, which once, by its surroundings, is started, is suddenly stopped in its growth and life. There are instances, however, where wheat, lying in the ground without starting, is attacked by a fungus which soon destroys the germ—the kernel is readily powdered in one's hands by rubbing. At different times during the last month many of the worst-appearing kernels, soft and seemingly with a dead germ, which were found by digging in the sown wheat-fields, were tested by planting in flower pots, and afterwards watering generously. In every instance every kernel grew. Hence, not only from many such slight tests, but also from general inquiry and observation in this vicinity, it is concluded that, on the whole, those who sowed before Sept. 20th are far ahead of farmers who sowed after that date; for some of the early pieces grew right along, while all other pieces and parts of the fields came up as soon as the rain fell in sufficient quantity. No sowed pieces were plowed over; all reports to that effect, upon careful inquiry, failed to be confirmed. Some, it is true, began plowing or cultivating the ground over to sow again, but were soon convinced that their wheat was all right and coming. Those who waited for rain were hindered from sowing at once by it. Others who did not plow or fit the ground until after the rain, did it then in a hurry; hence it was not thoroughly fitted. After all, wheat which came up no earlier than the first of this month will need a very favorable Autumn and Winter to build on it any hopes of a bountiful harvest. Thus far all wheat is growing very slowly. Wells are very low, and there is no water in swamps yet. Peaches and grapes were plentiful. Apples scarce, and nearly all falling off the trees. Winter apples are worth $2@2.50 per barrel. Early-planted corn and potatoes gave a good yield; late, almost nothing. Oats and barley extra-good. Corn is worth 80c.; potatoes, 80c.; barley, six rowed, $1; two-rowed, 85c.; wheat, $1.45. Clover seed is filled well, but only a few pieces were grown compared with the area of former years. W. X.

Ohio.

PORTAGE Co., October 10.—The Fall rains, warm and plentiful with abundant sunshine between showers, have caused the State to put on airs, so green does everything appear. Fall feed is growing rapidly and the wide-spread death that was prophesied to our grass lands in September has not come. Not one per cent of the grass died. Wheat seeding is yet being vigorously pushed and has taken almost the form of a mania. The result of this late seeding is very problematical, for of success there is only one chance in ten. The milk supply is again rapidly increasing, and milk is selling to the creameries at 15 cents per 10 pounds. Cheese 12½c. Live stock scarce and selling at high prices. Wheat, $1.45; rye, $1.15; oats, 48c.; apples, $1; potatoes, $1.25. J. G.

Tennessee.

MERIDIEN, Cherokee Co., Oct. 12.—I have dug the White Elephant Potatoes and find they weigh 32 pounds from 10 eyes planted in hills. One potato weighed two pounds. The Branching Sorghum I consider very valuable. The Washington Oats blighted badly. G. T. S.

Vermont.

HARTLAND, Windsor Co., Oct. 10.—My White Elephant Potato gave 67 tubers weighing 13½ pounds. They were on dry soil and the drought was severe in this section this year. One pound of Grange gave 17 pounds; one pound of Ontario, 22 pounds; one pound of White Star, 34½ pounds; one pound of Silver Skin, 38 pounds. I had 16 kinds of potatoes this season. Triumph, Burbank's, Beauty of Hebron, Pride of America, Sutton's Magnum Bonum I think will do well here. The frost in June hurt the potatoes and corn before the dry weather and hot sun. The Rural Branching Sorghum came up well, but I think it is too cold for it to grow very large. T. A. K.

Wisconsin.

GREEN BAY, Brown Co., Oct. 9.—Our season has been peculiar—wet in early May and again in late June, and then dry, but the drought was not so severe as farther south and east. Our hay crop was above an average. Barley and rye gave good yields. Corn is about three-fourths of a crop. Potatoes are more than an average crop on heavy and moist soil; but light on poor and light land. On the whole, the farmer has reason to be thankful for fair crops and good prices. I think the RURAL seed distribution is doing much good in causing farmers to make closer observations and comparisons as well as giving them many valuable useful and ornamental plants. The Branching Sorghum has 10 to 15 stems from one seed. I cut ten hills on August 7, when it was from five to six feet high; it has grown up again from two to three feet high; that which I left uncut is eight feet high and the seed in the milk, as green as in June with thermometer at 70°. The White Elephant Potato I received weighed two ounces, had nine eyes, and was planted May 17, and dug Sept. 26—yield 35 pounds. It is undoubtedly a great acquisition for the Rural family. The pinks are simply beautiful, they have been in bloom for two months, and have brought forth many expressions of delight from the people who saw them. That the blessings you are weekly and annually sending forth to the great Rural family, may return, not only in material wealth but in sympathy and good fellowship is the sincere wish of T. B.

LAVALLE, Sauk Co., Oct. 13.—We have had a very favorable season for growing crops. Though the Spring was late, the Summer was hot, with seasonable showers and a flood in July. August was hot and somewhat dry, but we had showers every 10 or 12 days. The last of September and first of October have been very rainy and the water was the highest of the season the first of the month. We had frost on October 6. Wheat was a short crop; barley good; oats, corn, potatoes, hay all good crops. Wheat, $1.10@1.25; oats, 30c.; corn, 50c.; barley, 55c.; potatoes, 60c.; butter, 20@23c. White Elephant Potatoes a good crop. Washington Oats rusted and lodged and were destroyed by bugs. M. S. H.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

SLIDE GATE PATENTS.

L. S., Burgettstown, Pa., sends a rough sketch of a slide gate on which parties are claiming a patent "royalty" in that neighborhood, and asks for information with regard to it, having heard that the RURAL, years ago, illustrated and described it.

ANS.—Our inquirer does not mention the name of the patentee of the gate in question, and the sketch does not quite represent any patented gate with which we are acquainted; but from the general appearance of the gate shown, and the manner of doing business practiced by the "royalty" sharks, we should judge it is either the Teel or Lee gate. Both of these were profusely illustrated and fully described in the RURAL of January 25, 1879, with the view of warning farmers against the exactions of agents who were demanding "royalty" on them, and of eliciting further information about them for the benefit of the farmers of Michigan in the first place, because they were contesting the patents in the courts, and of the farmers of the whole country, in the next place, because they would be protected by the triumph of the Michigan contestors. Teel's patent is No. 2,667, and was issued on December 1, 1823, and reissued July 2, 1867. The Lee patent is No. 50,605, and was issued on October 24, 1865. Professor R. C. Carpenter, of the State Agricultural College, Mich., took a prominent part in contesting the validity of these patents in that State, and in reference to the result of the contest he writes us, under date of October 14:—"We in Michigan, after our expensive law-suit, have learned to believe that there are no valid patents covering the simple slide gate. The farmers of Michigan were subjected to persecution under both the Teel and Lee patents. In the case of the Lee gate the patent covers a peculiar combination of slats and strips which, I venture to say, can not be found on any gate in Pennsylvania. Some 44 suits were begun against farmers in this State for infringement on this patent, all of which, with one exception, were dismissed without trial. That case having been carried to a conclusion, resulted so decidedly in favor of the farmers as to end completely all persecution under the Lee patent. Agents were immediately afterward sent throughout the State to collect royalty under the Teel patent. This patent without doubt covers the ordinary slide gate, but the farmers were able to prove the use of this gate for more than 20 years, and the Court decided a second time in favor of the farmers. In view of what has been proved in Michigan regarding the use of the slide gate, there is no question regarding the right of all to use this gate. Persons undertaking to collect royalty for its use should be treated in the same manner as swindlers." Should the farmers of Pennsylvania, or, indeed, of any other State be harassed by fellows seeking royalty under either of these patents, we shall be glad to furnish the same information with regard to the patents, that has been sufficient to secure a verdict against them in the Michigan Courts. We ask our readers, therefore, to let us know whenever any rascal troubles them on this score.

SORGHUM BUGS.

E. W. H., New Orleans, La., sends for name and history some insect pests that destroy the seed heads of the Rural Branching Sorghum, Pearl Millet, etc.

ANSWER BY PROF. G. H. FRENCH.

The insects sent me as doing damage to Sorghum seed heads in the Gulf States are scientifically known as Leptoglossus Phyllopus; the last name meaning Leaf Foot, and they might be known as the Leaf Foot Bugs. Say gave them the name of Anisoscelis Albicinctus. The only mention I find of this insect economically is in the report of the Department of Agriculture for 1875, where Mr. Glover says this of it in speaking of hemipterous insects generally: "Some of the insects of this family are said to be beneficial to the farmer by destroying other injurious insects, among which may be classed Leptoglossus Phyllopus. We have met with these insects frequently in Florida on the cotton plants, and at first suspected them of sucking the sap from the young bolls; but, although we watched their actions diligently, we must say that we never saw them in the act of piercing the bolls in order to suck the sap, and only once caught them under suspicious circumstances where a boll had been pierced in several places, and the sap was exuding from the wounds. Several of these insects were gathered together very near the flowing sap; they, however, dispersed as soon as they were observed, and flew away immediately." Further on he says that Mr. E. J. Earle of Evergreen, S. C., saw them destroying other insects. These are hemipterous insects belonging to the family Coreidæ to which belong the well known Squash Bugs (Anasa tristis), all of them being furnished with a long beak or rostrum instead of jaws. Those that are plant feeders pierce the plants with this beak and suck the juices, and those feeding upon other insects pierce their prey, suck out the fluid parts and cast away the dry skin. It may be that these insects found in the seed heads of sorghum were in reality feeding upon some other insects that were destroying the seeds. If the seeds or the other parts of the head were eaten by gnawing, then certainly it was not by this insect for it has no jaws. The insect in question is a brown bug five-eighths of an inch long with a white mark across the back and the hind legs expanded near the feet.

SILVER WORMS.

A Subscriber, Washington, D. C., asks how to get rid of the little Silver Worms that eat holes in all sorts of clothes.

ANSWER BY PROF. G. H. FRENCH.

There are two species of the so-called "Silver Worm," a Spring Tail (a species of Podura) and a Bristle Tail (Lepisma saccharina) that are common about houses, but more particularly the latter. They are both gray insects, the first with little bristles bent under the abdomen by means of which it makes considerable leaps. The bristle tails have, instead, three long bristles projecting from the tips of the abdomen. Both are somewhat flat, elliptical insects without wings and move rapidly. The Bristle Tails are to be found in houses through the most of the country, but they usually do so little damage that I have not seen any special remedies recommended by writers on economic entomology. I use camphor gum to keep them out of my cases of insects. If the clothing, such as silks or woolens, were in boxes or trunks a little camphor gum put among the clothes about twice during the Summer would prevent injury from these insects. Clothing that hangs in closets if molested could be treated the same as for clothes moths—frequent airing, shaking and sunning.

PLANTING CHESTNUTS.

W. H. L., Cooperstown, N. Y., having some 20 acres covered with worthless cherry and apple trees which he wishes to replace with chestnuts, asks when and how to plant these.

ANS.—Plant the nuts this Fall while fresh, just where you want the trees. Cover them two or three inches deep. If you are afraid squirrels will remove them this Fall and Winter, bury them with their bulk of damp sand in a box till April. Then plant them where the trees are wanted.

Miscellaneous.

F. P., Detroit, Mich., being about to move to a distance of 200 miles this Fall, and wishing to take his asparagus plants to his new home, asks whether he can transplant them when he moves, as there is no one to whom he would like to entrust their care where they are now set.

ANS.—Yes, they may be transplanted Keep the roots moist. Prepare the plot of ground to which they are to be removed well—have it rich, deep and mellow. A sandy, well-drained soil is best. Plow or dig trenches a foot deep four feet apart and set the plants two feet apart in the trenches. Spread out the roots well and cover. Give the bed a mulch of farm manure in December.

F. McM., Fair Haven, N. J., asks the meaning of *speciosa* as applied to such plants as Catalpa speciosa, Magnolia speciosa, etc.

ANS.—The word is the feminine form of the Latin adjective *speciosus*, showy, handsome, When the noun it qualifies is masculine, the masculine form of the word is employed, as Amaranthus speciosus, the Showy Amaranth; when it is feminine, the feminine form is employed, as Catalpa speciosa, the Showy Catalpa; and when the noun is neuter the adjective, too, must be neuter, as Chrysanthemum speciosum, the Showy Chrysanthemum.

N. K., Cherry Creek, Nevada, sends two specimens of grass for name, and asks their value as feed in comparison with Timothy.

ANS.—They are identical—Triticum repens, whose familiar names are Quack, Rye, Scotch or Quitch Grass. For feed it is just about as valuable as Timothy, but it is generally considered a pest, for the reason that it is difficult to get rid of it when once it is established.

H. M. Y., Clarke Co., Ark., asks where he can get the Marlboro Seedling Raspberry, and a Shropshire ram.

ANS.—We believe the Marlboro is not yet offered for sale. Shropshire Downs are for sale in the West by A. O. Fox, Oregon, Wis; Geo. Allen & Son, Palermo, Ill; Morgan & Cotton, Camargo, Ill; J. A. Brown & Son, Decatur, Ill: Mrs. Ann Newton, Pontiac, Mich.

W. D., Brookville, Ohio, asks how to winter the pinks from the Rural seed.

ANS.—They will not need special care. A little mulch worked in the soil of the beds in which they grow, will perhaps help them. We hope you have saved seeds from the best varieties which bloomed. If taken in they will continue to bloom after a rest.

N. H. B., Evelyn, Ga., sends for name some grass plumes which when dry open out, making a handsome appearance.

ANS.—The grass plumes are Erianthus Alopecuroides. They grow in swampy pools from Virginia to Florida. They quite resemble those of the beautiful E. Ravennæ, a hardy grass cultivated for ornament.

O. G. D., Wellville, Va., asks where can he can get seed of Egyptian or Green Valley Grass—Sorghum halepense.

ANS.—We think Dr. Jones, of Herndon, Ga., can supply it.

A. L., Topeka, Kansas, asks whether there is any dealer in Polled Angus Cattle within a "reasonable" distance of that point.

ANS.—Yes. A. B. Mathews, Kansas City Mo.

W. L. Bishop:—We hope to report later.

A. C.:—The more we see of the Pocklington Grape the more we like it. The quality is better than that of Concord.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, OCT., 22, 1881.

M. V. R., box received.—C. T. L.—W. E. Bubar, Stockton, Winona Co., Minn. A well-ripened seed head of what we suppose to be the Rural Branching Sorghum.—W. Y. H., thanks.—W. H. D.—R. R.—M. D.—A. S. THE
RURAL NEW-YORKER,
A National Journal for Country and Suburban Homes,
PUBLISHED EVERY SATURDAY.
Conducted by
ELBERT S. CARMAN.
Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.
SATURDAY, OCT. 29, 1881.

We would remind those who kindly propose to solicit their acquaintances to subscribe for the Rural New-Yorker for another year, that the present is really in some respects a more favorable time for such endeavor than later in the season. The weather is now generally more pleasant than in December and January and the competition from professional agents far less keen. We beg to say that we shall at all times be very glad to send posters and specimen copies for this purpose (including the Fair Edition) free of all charge to all who apply. Moreover, to each new subscriber for 1882, who subscribes before New Year's Day, we will send the Rural New-Yorker *free* for the remainder of 1881, beginning with the first issue after the receipt of his subscription.

If the Rural New-Yorker is not received promptly when it is due, subscribers will confer a favor by notifying us at once.

The Rural New-Yorker will be sent from now until January 1st., 1883 for $2.00. Our new posters for 1882 are now ready and will be sent *gratis* to all applicants. The Fair Number which fully explains our Free Seed Distribution and contains our Premium List will also be sent to all applicants, free of charge.

Of six grape-vines all planted in the same soil and same situation and treated alike, Niagara has made the most wood and the heaviest main stem; Concord next, Moore's Early next, Brighton next and two seedlings of our own least. Moore's Early was the first to lose its foliage, the two seedlings second, Brighton third, Concord fourth and Niagara last.

We have now completed the measurements of our special corn plots; of the Benton corn manured and unmanured; of the Chester Co. Mammoth grown upon the same land upon which the Blount's was raised last year, and finally of another plot (about three-quarters of an acre) of Chester Corn grown upon low land and manured with concentrated fertilizers. The reports will be presented in due time.

Of late months, we rarely present an original engraving of a fruit, plant or animal that does not elicit inquiries, which shows there is a misapprehension on the part of advertisers regarding the object of such illustrations. We have never asked or received any compensation whatever for the cost and presentation of these engravings. Our object is to bring before our readers in the most prominent manner the latest improvements in fruits, grains, ornamental plants, farm implements, etc., or the finest specimens of thoroughbred stock with the best and most trustworthy information we can glean respecting them. To provide material for such illustrations and the information derived from actual tests are among the main objects of the Rural's Experiment Grounds.

HOW DISEASE IS SPREAD AMONG STOCK.

A well known veterinarian of this city, a frequent contributor to the Rural, was summoned a week ago to a farm in Monmouth County, N. J., to investigate the cause of sickness and death among the swine on the place. On his arrival he found that four had already died and three more were sick. A post-mortem examination showed that the trouble was due to hog cholera. The owner had originally possessed 16 hogs, and on September 22, had bought 14 more from a dealer near this city, who said they had come from "Ohio." About a week after their arrival they began to sicken and die, and a fortnight afterwards the last of them perished. But before its death the home herd had begun to show the results of bad company, two of them having become sick. Since then others have been prostrated and several have died. A neighboring farmer had also bought 10 head from the same dealer, out of the same Ohio drove, and at the time of our friend's visit to Monmouth County three had been buried and more were sick.

This case affords an excellent illustration of the manner in which contagious diseases are spread among stock all over the country—not hog cholera alone but pleuro-pneumonia also and all other ailments of that sort. In the absence of efficient legislation for the protection of our stock, each farmer must individually adopt the best possible precautions to insure the safety of his cattle, sheep and swine, yes, and of his poultry, too. Whenever economically practicable, every farmer who desires to keep his domestic animals clear of contagion should breed his own stock. By doing this he will not only stand an excellent chance of escaping losses from contagious diseases among them, but with care and good judgment he will, in a few years, secure a herd or flock especially suitable to his circumstances and surroundings and therefore especially profitable. If this is impossible, then he should buy only from *farms* which he *knows* to be free from contagious ailments, and the animals he thus purchases must be transported to their destination in special cars or steamboats, for the ordinary cattle cars are, in many cases, among the worst disseminators of disease. The adoption of these precautions will, doubtless, always necessitate some extra outlay; but the neglect of them will often entail serious loss.

GAMBLING IN FARM PRODUCE.

Gambling in grain and other farm products, especially when it has assumed the form and proportions of a "corner" in any commodity, is attracting a great deal of attention everywhere of late, but particularly at the West. This is due to the unusual frequency and magnitude of such speculative movements, brought about by the manipulations of wealthy speculators who have lately introduced into the produce markets the tactics which they formerly practiced chiefly in the stock markets. A special impetus was the other day given to the discussion of the subject by the charge of Judge Jameson of Chicago to the Grand Jury of Cook County, in which he called attention to an almost forgotten Illinois statute making such gambling an offence punishable by fine or imprisonment or both. This law is directed against dealing in "options;" "forestalling the market" and "cornering the market or trying to do so." The "options" here referred to, however, are not the ordinary "options" quoted in market reports contracts to deliver or take a commodity at a fixed price at any time optional with the buyer or seller within fixed limits in the future—but what is commonly known as "puts" and "calls," which are privileges bought and sold entitling one to either sell or buy so much grain or other commodity within a certain period—transactions made only to a limited extent and not recognized by the Board of Trade in any market. By "forestalling the market" is meant, according to the Illinois Statute, "spreading false rumors to influence the price of commodities sold therein." "Cornering the market" Judge Jameson defines thus: "A party securing a contract for the future delivery of some commodity in the market, making it impossible for the other party to complete his contract except by purchasing of his adversary at his own price or paying in cash the difference fixed by such adversary." This the Judge characterized as "a process of driving unsuspecting dealers in grain, stock and the like, into a corral and relieving them of their purses." This is hardly fair, however, so far as the regular operators are concerned, for each party is trying to get the best of the other, and the "unsuspecting dealers" who are shorn to-day were probably among the shearers yesterday and will be again to-morrow, for the "bear" of one month is not unfrequently the "bull" of the next, and the one is "relieved of his purse" about as often as the other.

There is no doubt that it is grossly unjust, nay, downright dishonest, to exact the delivery of a commodity the entire supply of which is under the control of the party making the exaction. But beyond this individual injustice, a grievous public injury is done by such a monopoly, for the unlawful rise in price due to the fictitious value set upon the "cornered" commodity, has, as a rule, to be ultimately paid by innocent parties who had no chance to win by the gambling transaction. Moreover, the regular course of business is impeded or blocked by such gigantic speculations which have a demoralizing tendency on the entire community.

The great obstacle to putting an end to them by legislation lies in the difficulty of proving the offense; for among the overreached speculators there exists a strong disinclination to "squeal." The gambler in grain or in other commodities, like most of the gamblers in cards, does not seek protection from the law. In fact he can protect himself by refraining from gambling, and the dividing line between gamblers in produce and legitimate dealers is fluctuating and by no means clearly defined. The Boards of Trade and Exchanges can, if a majority in each so wills, suppress the pernicious practice more effectually than any legislation, and it is to be hoped that for the sake of their own reputations and the public welfare they will take vigorous action to this end.

So far as the farmer is concerned, "cornering" a product is an advantage, in that it raises the price of it, thus affording him an opportunity of selling it at a very profitable figure. On the other hand, however, it tends to foster a spirit of gambling in him, also, leading him to hold back his crops in ordinary times in expectation of getting for them the higher prices obtainable during the cornering processes, though to do so he has often to borrow money on mortgage to carry on his legitimate business. Not unfrequently, too, this spirit of speculation is so strong that during the rise due to the corner he clings to his produce for still higher prices till the corner has culminated either in success or failure, after either of which issues prices rapidly sink, often for a time below the legitimate level. During such periods of fictitious depreciation, the shrewd farmer will never market his products, but will always wait until the reaction has set in, which in such cases is sure to occur in a few weeks.

BREVITIES.

Send for the Fair Number of the Rural New-Yorker and the new poster for 1882. *Both will be forwarded* gratis *to all applicants.*

The Jersey bull, Prospect, whose likeness graced the first page of our Fair Number, died about a fortnight ago from drinking too much water at his home on the Messrs. Rowe's Co-operative Stock Farm near Fredricksburg, Va.

Remember this: Wait until a severe frost that freezes the ground at least two inches in depth before covering strawberry beds. Then use straw or coarse manure to cover. Straw is better because it contains no weed seeds. Cover lightly but as uniformly as possible. Sticks of any kind may be used between the rows to hold the covering.

In the case of Maddox vs. Brown, the Supreme Court of Maine has decided that the owner of a horse and wagon, who has lent it, is not responsible for injuries caused by the negligence of the borrower. In the above case Brown's son, aged 17, was using the wagon on his own business, under a general permission given by his father, when his carelessness caused the injury to Maddox for which he claimed damages from old man Brown.

Of the 447 female graduates of the Hartford, Conn., High School since 1848 only 147 have been married; a poor show for marriage among highly-educated females. Are they too independent to seek male help, or too shrewd to be saddled with male selfishness? Or, is their ideal hero so perfect that he is rarely met with? Or is it that the males are afraid of so much learning and independence, or do they believe that a masculine education unfits for feminine duties? On the other hand, of those 447 highly "finished" females only 25 have died; an excellent proof of the sanitary value of education—or of single-blessedness.

Apologetic.—We have received the following note: "Please give me *credit* for the wrong name which now partially attaches to the new Black-cap, Sonhegan. Mr. Downing requested me to find the name on the map or in the post-office directory, but not discovering it in either, I naturally supposed that it was intended for the more widely known Indian name Skowhegan—a post-village on the Kennebec River, Maine. The creek mentioned by Messrs. Hale is but little known outside of its locality, and hence so far as there is error, it is exclusively mine. A. A. Bensel.
Newburgh, N. Y.

Farmers and the Signal Service.—We have noticed an article going the rounds of the agricultural press stating that the Signal Service was about to make arrangements whereby farmers in the vicinity of Signal Service Stations could be informed of the probable condition of the weather 24 hours or so in advance. This was to be done by setting off colored rockets during the evening of each day. In order to get at the facts in the case, we referred the statement to Gen. W. B. Hazen, Chief of the Signal Service Department, who replies that he has never entertained the project of informing farmers, or others, of the weather indications by means of rockets.

The Commissioner of the General Land Office in his report just sent out to the Secretary of the Interior, speaking of the delay of business due to the insufficient clerical force in his office, says that in a single division of public lands there are now over 60,000 entries and legal notices of settlement and claims unposted on the tract books and unexamined, and about 1,300 contracts unexamined. Other divisions are as much or more behind from the same cause. Delay in this department of the public service often entails much inconvenience and loss upon those least able to endure either—the settlers—homesteaders, and others—along our Western frontier. We trust therefore, that the deficiency here will be promptly supplied—a thing that can be economically done by drafting to this office some of the very supernumerary clerks in some of the other departments at Washington.

A number of wholesale importers of hay recently brought a test case at Albany, N. Y., against the United States, to recover an alleged excess of duty. It was claimed that the duty of 20 per cent. collected pursuant to the United States custom laws was illegal, in that hay was a raw material while 20 per cent. duty was chargeable on it only as a manufactured article. The Government claimed that the processes of cutting, drying and curing grass, as they converted the starch and gluten therein to sugar, made hay a manufactured article, and called experts to prove it. The jury, however, gave a verdict in favor of the plaintiff for $2,000—the excess of duty collected. It is said that should the duty on imported hay be placed at 10 per cent.—the amount chargeable on it as raw material—the Government will lose from $500,000 to $1,000,000 a year. The case is to be appealed to the United States Supreme Court. The decision will be of importance to our farmers in the States along the Canada border, and to Canadian farmers, who are sure to increase their imports of hay should the Court decree in favor of the lower rate of duty.

The estimates made by the Department of Agriculture of the wheat and corn crops of last year have been revised on the basis of the Census returns of the crops of 1879. Many returns to the Department of last year's crops stated that the crops of 1880 were "such or such" a percentage below or above the crops of 1879, and the aggregates were worked out on this basis. It turns out, however, that the Department's estimates for 1879 were below the figures given by the Census, so that it has been found advisable to alter the yields of wheat and corn in the various States. According to the new estimate just published, last year's total wheat crop amounted to 498,549,868 bushels instead of the 480,849,723 bushels previously estimated—an increase of 17,700,145 bushels. The revised estimate also puts the total corn crop of 1880 at 1,717,434,548 bushels, instead of the 1,537,535,000 of the previous estimate—an increase of 179,899,548 bushels. Of course, all estimates of this year's wheat and corn crops based on the correctness of the Agricultural Department's figuring on last year's crops will have to be revised on the basis of these revised estimates.

The American Humane Association held its fifth annual meeting at Boston last week. Representatives were present from Maine, New Hampshire, Massachusetts, Rhode Island, New York, Pennsylvania, Delaware, Illinois, Nebraska, Georgia, and Nova Scotia. It proposes to have agents in every town and city, at a cost of from $18,000 to $20,000 a year, which is to be collected by voluntary subscriptions. Already this humane league is said to be represented in the 36 States and Territories. Its object is to prevent and punish cruelty to dumb animals. The chief end at present engaging its attention is the proper transportation of stock on our railroads. To further this the Association offered, some time back, a prize of $5,000 for a satisfactory stock car in which animals can rest and be fed and watered while in transit. In competition for this prize 700 designs were sent in by representatives of every State and Territory except Washington Territory and New Mexico. Canada, England, Switzerland and Russia were also among the competitors. Not a little, no doubt, to the disappointment of every one of the 700, Mr. E. L. Brown, of Chicago, who presided, announced that not one of the designs had so complied with the requirements as to deserve the prize. This is, therefore, still open to competition among the inventive geniuses of this and other countries.

A century-and-a-half ago—or, to be precise, 146 years ago, in 1735—a number of Bulgarians, too haughty longer to brook or too hasty longer to bear Turkish insolence and outrage, fled to Hungary. Adam delved and Eve span and the exiles were mostly of the same honorable vocation as their remote exiled ancestors, and, like the subjects of the Pharaohs, their children have mostly followed the craft of their fathers. Wrenched from the crushing Ottoman grasp by the fierce mailed hand of Russia during the late Turko-Muscovite war, the Fatherland the other day invited the descendants of her children, exiled by tyranny, to share in her newly acquired freedom, offering them a large area of land near Sistova on very easy terms. Twelve thousand of them were eager at once to exchange their long-accustomed hardships for the ease which distance of time and place rendered all the more alluring. The contracts for the farms which several generations of them had expended their hard, dull lives in tilling, had now expired, and they were all the more joyous to start. The Magyars, however, the liberty-shrieking compatriots of Kossuth, like those other tyrants of old, refused to let the people go. Passports were denied, and orders are reported to have been issued for the use of force to prevent the exodus, should force be necessary. No sea, Red, White or Yellow, unfortunately, separates Hungary from Bulgaria; Moses, too, alas! is dead, even he who freed our "niggers"; and, more's the pity, the rod is nowadays considered an instrument of oppression, not of freedom.

Miscellaneous.

FACTS AND FIGURES

Regarding Minnesota, Dakota, Town and Country Along Red River.

MESSRS. HOLMES AND SWEETLAND.

[Special Correspondents of the RURAL NEW-YORKER.]

AFTER a pleasant ride over the St. Paul, Minneapolis, and Manitoba Railway, which, by the way, they are relaying with steel rails to the Dominion, we arrived at Pembina, D. T., which lies on the west side of the Red River of the North, near the Manitoba line and Fort Pembina. It is a well-situated town of some 800 population, with an annual business estimated at $600,000. There are four religious societies, a frame school building, to be replaced by a modern brick structure to cost $8,000. Among other improvements we note a handsome $15,000 court-house and jail nearly completed. Masons and Odd Fellows have organized lodges. A good weekly paper, the Pembina Pioneer, ably represents this section. Pembina County has many rich wheat lands still open for entry, and farm lands for sale at prices from $3 to $25 per acre, according to location. The county is well watered and timbered along the streams.

In a conversation with H. R. Vaughan, an old resident and land agent, he accounted for the large yield of wheat in this section by the increase in grains. The breasts are long and full, each spikelet containing three to five grains and sometimes even six. The varieties now grown are Scotch Fife, Red Fern, with the new Pringle's Surprise, Golden Drop, White Russian and other importations, all seeming to do well. A. F. Appleton, a farmer on Park River, makes the following astonishing but true report, which shows what *can* be done:—"I had 30 acres of crop on last year's breaking, without back-setting; 14 acres of wheat thrashed 496 bushels of No. 1 hard—about 35½ bushels per acre. From 16 acres I had 1,042 bushels of splendid oats—65 bushels to the acre. I have not heard of any one thrashing less than 30 bushels of wheat to the acre in this section." The climate—the usual objection to this far Northwest—is, of course, cold and clear in the Winter, but people live and thrive. It is said that one degree west is regarded as equivalent to half a degree south in temperature, and the fact which we have learned—that 1,500 miles northwest of Winnepeg buffalo graze the year round—tends to prove the assertion.

Our next stop was at St. Vincent, Minn., the present northern terminus of the St. Paul, Minneapolis and Manitoba Railway and the southern terminus of the Canada Pacific. This company courteously desired us to visit the Province of Manitoba, an invitation we may be able to accept the following season. The first building in St. Vincent was finished in the Spring of 1879, and the place has now a population of 300 to 400. The St. Vincent Town Site Company, J. P. Shepard resident manager, are the proprietors It is the desire of the company to have actual residents, to whom lots will be sold reasonably low. The needs of the town are a hotel (expected to be supplied this season), a saw-mill, and hardware and saddlery stores. They have an Episcopal Church, a Presbyterian Society and a good school. John A. Vanstrum, post-master, will willingly reply to correspondence. The Red Wing Mill Company own here the largest elevator on the line.

Going south, we stopped for dinner at Hallock, a yearling, but with a good hotel, built as a sportsmen's resort, and four or five stores. We lodged at Argyle—if a dry-goods box and blanket be termed lodging—and found when morning dawned a smart little town, mostly Scandinavian and Canadian, of some 175 population. The railroad company are making arrangements to build a new depot to supplement their three stores, two grain ware-houses and dwellings.

Warren, our next stopping place, was platted in September, 1879, and now claims 300 population. It has the elements of thrift, brisk, enterprising business men, and the added luxury of an excellent little paper, the Warren Sheaf. As in the case of other towns aloug the line, a good proportion of its people are foreign. Near this town, as well as near any of the others, are abundant opportunities to purchase farms of from 40 acres upwards at very reasonable figures. We attempted to thank McCrea Brothers for their courtesies, but they forestalled us by cordially commending the enterprise of the RURAL NEW-YORKER for informing its readers of the truth regarding this country. We ate a hearty supper at Euclid, and learned that the town was prospering. It contains over 100 people, has a Presbyterian Church and a new school-house, costing $2,500. The up train now stops for dinner here at the handsome hotel, and again for supper on its way back. These towns are all new, as the railroad has originated them, while a tide of immigration is pouring in which will speedily make them busy trade centers.

We spent a day of interest under the care of Chas. E. Hamilton, R. E. and R. R. Land Agent, at Crookston, Minn., where the St. P. M. & M. branches out into Dakota. The city, which is within a bend of the Red Lake River, is three years old and with nothing but this wondrous country to aid it, it has now a population of from 1800 to 2000. It has a Methodist church, and Congregational, Baptist, Catholic and Episcopal organizations. The last will build soon. There is also a good school system, graded and high, employing five thorough teachers. The buildings are valued at $10,000. There are two newspapers, the "Chronicle" and "Journal," alive and active to the interests of the country. Here, too, are to be found civic and social organizations of repute; improvements steady, substantial and rapid; broad streets; numerous business houses; good sidewalks, etc., and an excellent agricultural country being rapidly settled by farmers from abroad and from the East; stimulated no doubt by the liberal rebates for breaking and plowing, offered by the R. R. Co., upon their low prices for lands. Here is an item: M. R. Brown put 40 acres to oats, paying every expense, with interest calculated; the total cost was $596.41; the storage until Spring was $110; the yield was 2,200 bushels; the price received 55c. per bushel—total $1210; actual profit, $503,49. Near almost any station equally good land can be purchased at from $5 to $10 per acre. The business of Crookston for the last year has been over $900,000. It is a terminal point for freight train service and with a flume which would cost from $60,000 to $70,000, it could obtain a 1400 horse power, with a 12 foot fall. Such rapid and permanent improvement must be a marvel to any one not conversant with this country. We noticed a very fine court-house which is nearly completed at a cost of $20,000; a handsome building is about finished by the First National Bank, while there are many pretentious residences.

About midway between Crookston and Grand Forks was Fisher's Landing, now called Fisher, a bright and growing town—it would be hard to find a dead town in this live country. It is on the Red Lake River, at the head of navigation. Messrs. Demers and Thompson own the town site and the latter informs us that from his 1,000-acre farm he has obtained 22,000 bushels of wheat, so it is plain good crops are not the exception, but the rule. Religion and education are well provided for. Business men are constantly busy. The exports of grain from this town will exceed 500,000 bushels this season, besides what is used by the Red Lake Flouring Mills, of 100 barrels daily capacity, now running night and day. "No. 1 Hard" grinds up into just as good flour here as at Minneapolis. There are three elevators here with a capacity of 150,000 bushels. There are also substantial building improvements; good bricks, manufactured here, are bought for $8 per 1,000. Farm property is not high and hence the increase in population is marked.

Whirling westward sixteen miles we cross the Red River of the North, the boundary line between Minnesota and Dakota Territory, and halt in Grand Forks, beautifully situated upon the western bank. We remained here only a couple of days, feeling most of the time as if encompassed by a western cyclone; everybody moves as if run by steam power. The streets were whirlpools of business, and the stores miniature bee-hives. The oldest, young city, and the largest, small one of which we have written. It has a population of about 2,800, churches, schools, press, (semi-weekly, and weekly), civic societies, a fire department, a chamber of commerce, elevators overflowing with wheat, railroads to the North, South, East and West, by the St. P., M. and M., though their Eastern line only runs into the the main line of this county, from St. Paul to Pembina, at Crookston; transportation by the Red River steamers, a banking Capitol of $150,000, a commercial business of about $1,250,000 annually, and several embryo manufactures.

The details of all these, and the inexhaustible resources of the country tributary to this point, both agricultural and commercial, as also the possibilities and advantages in manufacturing, demand more time and space than we can appropriate here, and they will receive a special review from our pen in the next number of THE RURAL NEW-YORKER.

One of our party visited Ojata 12 miles to the westward, the present railroad terminus. Here within a year a little burgh has sprung up like magic, upon the prairie. Stores like mushrooms in a cavern have appeared in a single night. They say they have 200 population, and whether it is over estimated or not, certainly it is a "booming" little place. Over 30,000 bushels of wheat have been marketed here within four weeks. Upon the train we met J. J. Cavenagh of Grand Forks, who is proprietor of the town-site. Lots are bringing $25 to $100 and a need is felt for a harness-maker, shoe-maker, and wagon shop. They have timber within six miles on the Turtle River. The town is populated by Americans and Canadians.

The St. P. M. & M. are employing many men in the construction of their line to the Dominion west of the Red River. We were almost hourly greeted by marvelous reports of this country, and observation verified most of them.

We had the pleasure of meeting Messrs. Comstock & White of Moorehead, who are largely interested in towns and lands along the line. We also met the Hon. Jno. La Moure, of Pembina, D. T., one of the proprietors of the town of Grafton, which is rapidly settling up with energetic business men and bids fair to become a point of considerable importance. It is on the Park River—a region bearing an enviable reputation for agriculture. It is the county-seat of Walsh Co., and though it is only 60 days old, yet it has from 30 to 40 buildings now up. The former gentlemen besides being the owners of Grafton, are also town proprietors of Bathgate in Pembina Co., on the Tongue River, 10 miles from the boundary line, and of Minto, a station on the Forest River (or Old Salt) near which large salt deposits are found. The settlement of Canadians is quite large around here. Minto has an admirable location for sporting, hunting and fishing, as well as for agricultural products. Manvel, named after the general manager of the railroad, is on the Turtle River, the first town north of Grand Forks. Dakota, although it has no railroad lands in this vicinity, is quite thickly settled with small farms, especially along the streams. Along the west bank of the Red River are the villages of Bowesmont, Drayton, St. Andrews and Acton.

It has been our object in giving this pen picture of this land of the golden grain, to stick closely to "facts and figures" and to do so without any blatent "puff" or undeserved commendations. The information as far as we can learn can be relied upon. The special reports given are of course among the best. No country is devoid of drawbacks; but here to the worker the returns seem reasonably sure, and in many cases remarkable.

Societies, &c.

SESSION OF THE AMERICAN POMOLOGICAL SOCIETY.

[RURAL Special Report.]

THE SOCIETY was called to order on Friday, at nine o'clock A. M., by Vice-President Barry.

The report of the Committee on the Award of the Wilder Medal, which has been heretofore noticed, was followed by that of the Committee on Fruits Exhibited. This committee found on the tables 535 plates of pears, 188 of apples, 17 of peaches, 100 of grapes, 17 of plums and 71 of miscellaneous fruits, shown by the following

EXHIBITORS.

Michigan State Horticultural Society, 69 plates of apples, 19 of pears, 23 of grapes, six of peaches; also, as part of the same, an exhibit from the Grand Traverse region by Judge Ramsdell, to show the influence of Lake protection at latitude 44 deg. 40 min. north, 26 varieties of apples, six of pears, seven of plums, one of nectarines and three of peaches. This collection also included well-preserved specimens of Roxbury and Golden Russets of the crop of 1880, which had been kept, without special appliances, in an ordinary cellar.

The Montreal Horticultural Society exhibited 34 varieties of apples and one of pears; Warren Femo, of Massachusetts, 53 of pears; Benj. G. Smith, of Massachusetts, 50 of pears; F. M. Marble, of Massachusetts, 19 of pears; Hovey & Co., 190 of pears; Dexter Asylum, 12 of pears. Of seedling pears D. W. Lathrop exhibited one plate; Edward W. Lincoln one, while 90 seedlings of the late B. S. Fox, of San José, Cal., were again on exhibition, together with 30 varieties of grapes. W. A. Bradbrook, of Norfolk, Va., showed four plates of pears; G. F. B. Leighton, one plate of Duchesse, very large; S. C. Hartow, Bangor, Me., 14 varieties of pears and 68 of apples; E. Williams, Montclair, N. J., one plate of apples; W. H. Hills, Plaistow, N. H., one plate of apples; Robert H. Gardiner, Gardiner, Me., 10 plates apples; Z. S. Ragan, Missouri, five plates apples; Bush, Low & Meismer, Bushburg, Mo., four plates grapes; T. S. Hubbard, Fredonia, N. Y., one variety grapes; H. S. Anderson, Union Springs, N. Y., one variety grapes; A. J. Caywood, Poughkeepsie, N. Y., two varieties grapes; G. A. Stone, Rochester, N. Y., one variety grapes; J. B. Moore & Co., Concord, Mass., two varieties grapes; Niagara Grape Co., one variety grapes; Dr. M. Struetzeder, California, nine varieties grapes, one variety oranges, nine varieties miscellaneous fruits; J. W. Wolfkile, Los Angeles, Cal., 14 varieties oranges, four of Japanese persimmons; Mrs. Jeannie Carre, Los Angeles, Cal., four varieties oranges, one of China lemon; M. Rosenbaum, Pasadena, Cal., two varieties oranges, one seedling lemon; —— Robinson, San Gabriel, Cal., three varieties oranges, one of Sicily lemons, one of pomegranates; P. J. Berckmans, Augusta, Ga., six varieties Japanese persimmons, two pomegranates; M. H. Bixby South Haven, Mich., one basket peaches, illustrating his mode of packing this fruit for transportation. Also, by a class of students of the Michigan Agricultural College, assisted by Professor Cook, eight cases of insects beneficial and injurious to fruit culture, carefully classified and arranged. A map showing the horticultural capacities and the present status of fruit culture in the lower peninsula of Michigan, also accompanied the exhibit from that State.

The report of the Committee on New Fruits, which was also made in this connection, together with a report of the remarks following it by Hon. P. J. Berckmans, Prof. W. J. Beal, Dr. John A. Warder and Isidor Bush, condensed as much as possible are as follows:

NEW FRUITS.

Grapes—By C. H. Woodruff, White, Ann Arbor, too acid; Woodruff's Red, berry large, red, pulpy; McDonald's Ann Arbor seedling, berry very large, blue, pulpy, said to be earlier than Hartford Prolific. By J. H. Ricketts, Lady Dunlap, berry medium, amber, vinous, quality very good; Golden Gem, berry small, white, delicate, muscat flavor, sweet, best; Empire State, berry above medium, white bunch long, cylindrical, shouldered, berry good, a showy variety. By T. S. Marvin, Watertown, N. Y., Continental, berry medium, bunch above medium, compact, slightly shouldered, color white, very good; Rutland, berry and bunch medium, compact, color blue-black, fleshy, spicy, vinous, skin thin, very good; Corporal, bunch and berry medium, loose, color black, slightly vinous, good; Sharon, bunch small, cylindrical, compact, reddish amber, flesh dissolving, very good; Laura, bunch small, not very compact, very small, light amber, pulpy, hardly good; Watertown, bunch medium, loose, berry medium, slightly oblong, white, flesh breaking, sweet, very good. All these varieties show indications of foreign parentage. J. G. Burrows, Fishkill, N. Y., Reliance, bunch small, resembles Delaware in size and color, but not so compact or so sweet.

Pears—Lothrop's seedling No. 1, medium, pyriform, yellowish with russety, flesh melting, medium fine grain, juicy, very good, promising. Seedling pears from B. S. Fox, San Jose, Cal., No. 58, medium, oblong, pyriform, gritty; No. 180, large, globular, coarse, rather astringent; No. 180, pyriform, large, partakes of the nature of the Beurre d'Anjou; No. 100, above medium, turbinate acute, sweet, very good.

Hon. P. J. Berckmans, President of the Georgia Horticultural Society, spoke on new Southern fruits. Prof. W. J. Beal, of the Michigan Agricultural College, Lansing, spoke on the classification of pears and apples by their flowers, claiming that this would often prove very useful. He exhibited diagrams illustrating his subject. Dr. John A. Warder, President of the Ohio Horticultural Society, made some remarks on the methods of protecting orchards. Prof. Bush, of Bushbury, Mo., spoke on a method of improving the catalogue of the Society. He urged that the localities to which a fruit is unsuitable should be indicated, as well as those to which it is peculiarly suited.

The Committee on New Fruits, to whom the preamble and resolutions respecting the naming, exhibiting and judging of fruits had been referred, reported, recommending the appointment of a committee to devise a set of rules, as proposed in such resolutions, to be reported at the next biennial meeting of the Society.

The report of the committee was accepted, and Vice-President Barry named the following persons as a committee for this purpose:—T. T. Lyon, Chairman, Dr. John A. Warder, John J. Thomas, C. M. Hovey and P. J. Berckmans.

The Society then proceeded to the discussion of varieties of

RASPBERRIES,

as named in the catalogue. Little of special novelty or importance was developed during the consideration of the catalogue varieties, which were rapidly passed over; after which opportunity was afforded for the naming and characterizing of new and comparatively untested kinds. Among these the following were named and generally favorably spoken of by those who had acquaintance with them, viz.:—Hopkins, Hoosier Mammoth, Southegan, Cuthbert, Caroline, Parnell, Patrician, Iowa Seedling, Reliance. It is not the policy of the Society to commend novelties under any circumstances; hence the names of these simply go upon the record accompanied by the remarks

of individual members, but without action by the Society, the discussions, with the varieties in question, going, tacitly, to the Committee on Revision of the Catalogue, as a portion of the matter from which they are to evolve their conclusions.

The Chairman named as a Committee on Resolutions Dr. John A. Warder, of Ohio; J. S. Woodward, of New York, and William Parry, of New Jersey, whereupon the meeting adjourned to three o'clock P. M.

At the opening of the afternoon session the Society resumed the consideration of catalogue varieties, commencing with

BLACKBERRIES.

Ancient Briton and Barnard were spoken of as failing to attract the attention they deserve, although they have been a long time before the public. New Rochelle (Lawton) still holds a prominent position. Snyder, although lacking size, is valued for its hardiness; it was commended especially for New Jersey. Wachusett is valued and much grown in Massachusetts, where it is hardy and prolific. Wilson's Early is considerably grown in Michigan and New Jersey. Kittatinny was commended, except that it frequently suffers from red rust, or fungus. Opportunity being afforded for the bringing forward of newer varieties, Taylor's Prolific was named as hardy, productive and of fine quality. Wallace also was named as a strong grower and a prolific bearer.

The consideration of the catalogue list of

PEACHES

was then taken up. Alexander was very highly commended at the South, ripening about the first of June and continuing three weeks. Honeywell was said one year to be 15 days earlier than Alexander and the next year 15 days later. It requires a long time to properly determine the relative season of these new varieties. It was said to be a regular bearer every year. Briggs's Red May is a little later than Alexander, and, being serrate-leaved, it is liable to mildew at the North. Bower's Early is much larger than Alexander. Barnard is losing its former reputation in Michigan and should have one star stricken from the column for that State. Early Rivers is an excellent peach, and should be in every orchard. It is growing in favor. Early Albert was praised as a fine variety. Beatrice was objected to as too small. Foster was claimed to be inferior to Early Crawford, and similar in season. Hill's Chili is hardy and bears well; like Barnard, it is declining in popularity. Stump the World is a valuable white-fleshed peach. Keyport White is bearing better than most others this season. Levy's Late was recommended for Washington. Wheatland and also Columbia can be easily and surely reproduced from the seed. Early Silver is a nice, luscious early peach. Stonewall Jackson succeeds well. Wager is a heavy bearer. Bilyius is a desirable very late peach.

The discussion of varieties of peaches having been concluded, a short time was devoted to a random discussion of

PEARS.

It was stated that Clapp's Favorite gives great satisfaction, but shows a tendency to blight in various localities. Sterling is one of the most desirable of early market pears, and one of those least liable to blight. Souvenir du Congres is scarcely as good as Bartlett. It averages of larger size. It is of clean and healthy habit, but likely to be affected by severe cold. There is no other pear as large as this, of as good quality. Beurre de l'Assomption is hardy, large, and the tree vigorous. Frederick Clapp bears abundantly, is very vinous, and of objectionable form. President Clark is of medium size and very promising.

RESOLUTIONS.

The deliberations of the Society were now closed. The report of the Committee on Resolutions being called for, the following were reported and adopted:—

Resolved, That, as the American Pomological Society, we would express sincere and heartfelt thanks to the Massachusetts Horticultural Society and the people of Boston for the very cordial manner in which its members have been received and for the hospitalities extended to them while here.

Resolved, That we would express our thankfulness that our worthy and honored President, Hon. Marshall P. Wilder, has been spared to us, and has so far recovered from his recent accident that he has been enabled to so satisfactorily preside; and we truly hope that he may long be spared to meet with us and preside at our deliberations.

Resolved, That we would express our great horror at the dastardly and cowardly act that struck down President Garfield, and our deep love and sympathy for him and his family in their severe affliction; and we devoutly pray that he may be speedily and fully restored to perfect health.

A resolution of thanks to the press of Boston generally, for the able and faithful manner in which the proceedings of the convention have been reported, was also unanimously adopted.

On motion of Colonel Coleman, the convention resolved, That the exhibitions of fruits should be hereafter, as heretofore, encouraged by the Association.

The convention then adjourned, to meet at the banquet in Music Hall at six o'clock in the evening.

NORTH CAROLINA STATE FAIR.

[Special report to the RURAL NEW-YORKER.]

THE twenty-first annual exhibition of the North Carolina State Agricultural Society opened on the grounds of this society at Raleigh, Oct. 9, and closed Oct. 15. The weather during the entire fair was pleasant, the attendance good and the exhibition in many respects superior to any former ones, the only noticeable falling off in any of the departments being in cotton and cereals. These products have suffered much from the long-continued drought and the early biting frosts. Tobacco, which in this section is a staple product, was severely injured by the late frosts, and, indeed, in Southern Virginia and Northern North Carolina many crops were entirely destroyed, and with a few exceptions—where farmers had gathered a part of the crops—they lose everything.

A visitor to these grounds during the fair is particularly impressed with the improvements in cattle and horses that have been made of late. Where a few years ago one only saw native and grade cattle he now sees many well-bred cattle of popular breeds, including the Devons, Jerseys, Ayrshire and others. It is pretty generally believed in this section that good grade cows do better in this latitude than the pure-bred, and hence the grades were the most numerous. A very fine grade cow six years old was sold on the grounds to P. A. Wiley, the Treasurer of the Society, for $100. She has a fine milk record and attracted much attention. But few pens of sheep were shown. A few Merinos, Cotswolds and South Downs represented the principal breeds, and these were thin in flesh and showed signs of thin and dry pasturage.

The display of hardware and cutlery by T. H. Briggs & Sons, and of farm wagons, by Julius Lewis & Co., both extensive dealers of Raleigh, was an important feature of the exhibition and added largely to the attractiveness of the fair. The implement and machinery display of L. L. Polk & Co. was one of the best on the grounds. This enterprising firm deal largely in all the leading implements and improved machinery, and in their booth they had a Skinner & Wood engine in operation, to which was attached a thrasher and wood saw made by A. W. Gray's Sons, an ensilage cutter from the New York Plow Co., and all in working order. Among their exhibits I noticed the Cooley creamer, the Davis swing churn, the Kemp & Burpee manure spreader and many other improved and popular labor-saving implements. The Champion mower and reaper, the Thomas rake, the Reiner harrow, and other well-known implements were exhibited by the local dealers. Mr. J. D. Potterfield, the State agent for C. & G. Cooper's engines, made a very handsome display. The traction engines were shown in operation, and a portable engine of the same make was also used to run a part of the machinery in Machinery Hall. The Butterworth thrasher, made at Trenton, N. J., was the receiver of the first premium, and last year the same separator received the highest award of merit—a silver medal at the North Carolina Fair. Gill & Son and G. M. Smith & Co. also showed fine thrashers.

On Wednesday Gov. Jarvis was in attendance and made a brief but practical address. He alluded to the extreme drought and early frosts which had so severely affected the agricultural interests of the middle section of the State, and forcibly urged, what the RURAL has so often done, the great necessity of good and thorough tillage of the soil. "No matter" he said, "whether the season be wet or dry, the man who plows and hoes his corn and cotton the best will receive the best crops." He contended that there was no cause for gloom, and predicted that within the next year more miles of railroad would be completed in the State, more capital from without would be permanently invested within its borders and more immigrants would be settled among them than in any previous year since the war.

C. B. B.

CATALOGUES, ETC.

HAND-BOOK of Virginia. Third Edition. By State Commissioner of Agriculture. A very full account of the Geology and Mineralogy of the State; of its numerous resources, its educational facilities, etc. The appendix contains census returns of crops and sheep by counties.

THE 35TH ANNUAL REPORT OF THE OHIO STATE BOARD of AGRICULTURE FOR 1880. By W. I. Chamberlain, Sec'y. In this report Sec. Chamberlain has succeeded in presenting to the public a concise statement of the agricultural interests of Ohio. The work embraces the reports of various business meetings of the Board; of the State Fair of 1880, of the annual Agricultural Convention and of the proceedings of various county societies. A part of the volume is devoted to matters of interest concerning Farmers' Institutes, together with lectures, essays and addresses delivered before the various Institutes. The Board is engaged in a new work in the inspection and analysis of commercial fertilizers, and on monthly reports on condition of crops and stock. Mr. Chamberlain in his prefatory remarks takes occasion to note the fact that the general assembly promptly voted increased appropriations for the Board, thereby placing the department on an equal footing, in a financial point of view, with other State Departments. In the appendix occurs the 14th annual report of the State Horticultural Society for 1880–81. Some instructive papers on "Ornamental Planting," "Picking, Keeping and Marketing Apples," "Rural Cemeteries," "Fruit Evaporation," etc., etc., appear in this portion of the work. On the whole, the 634 pages of the work are replete with valuable statistical and general information. Secretary Chamberlain is doing a good work for the agriculture of Ohio by his earnest endeavors in its behalf, and for the agriculture of the whole country, by setting a good example of energy and thoroughness for the imitation of similar officials in the other States of the Union.

Literary.

THORNS AND ROSES.

Continued from page 690.)

Brandon's visit was the only event in these few days, and he had been out in the snowstorm to see some sick tenant, though we did not hear this from himself. He was one of the few who are content to do good in silence, and, as Edith said, he very seldom used the first person singular in conversation.

She gave him an account of Edgar in her own laughing way, and how clearly does that scene rise before me now! Her sunny face turned to him—the careless grace of her attitude, his dark eyes bent on her with the rare smile flickering in their depths and I knew not what was the strange feeling that shot through my heart; it was many a day ere I did know.

At length Mr. Hays's expected letter came, and Edith brought it to me in triumph. He wrote in a style that gave me an insight into his character; a polished, courtly coldness pervaded it, though he was fond of his daughter in a way. He commended my prudence; but Edith, he was certain, would never forget herself, or the ills that rose from poverty. He would be obliged by any kindness shown to Mr. Dana, a young man for whom he had much esteem. There was an unnecessary amount of caution; he insisted a little too strongly on the difference between Edith and her old lover. I thought I would not have had my father write thus.

"Well?" said my cousin, impatiently.

"I can say no more. I am in no way responsible for you; I will not be, and you please will let Mr. Hays' understand that."

"Fiddlestick! Edgar *shall* come!"

She went away to tell Aunt Dorothy that her father would be personally obliged by any kindness shown to Mr. Dana—this being sufficient to secure aunt's approval; for "the love of old loves and lost times," had not faded from her heart. It was decided that Mr. Edgar Dana should be invited; Nevil Verner had not returned, and aunt wondered what had become of him. The storm had passed, the wintry days were bright and clear, but he did not come.

One afternoon Edith, who had been out riding, returned with the announcement that she had met Mr. Dana, and had given him an invitation, which he had accepted.

"I knew I had only to say come, and he would wish to come, though, Lady Kate, he has pride enough to keep away if he thought you did not want him. I made a speech on your behalf and on aunt's.

Aunt Dorothy was a little mystified about Edith's friend. She fancied that he was related to the Hays's, and though rather shocked by her niece's free and easy invitation, was pleased because others were pleased.

I was sorely troubled about Nevil. Why did he not come? Could it be that he had credited Edith's foolish tale? It might be that he did; and if such were the case, I could not undeceive him. I told myself that the love which faltered at an idle jest was little worth; but notwithstanding my attempts at philosophy, my heart was heavy.

When the evening came on which we expected Mr. Edgar Dana, Edith was in high spirits. I was a little curious also, knowing his story; but when the listened-for ring came, the visitor was Nevil.

He greeted aunt with his usual courtesy; the same to me, replacing the smile and warm clasp he had previously given me. I was hurt and disappointed; but I hid my feelings, inquiring about Mrs. Verner as though I saw no change, whilst he gave some explanation—I know not what—for his absence. Mr. Dana shortly after was announced, and Nevil flashed a glance at me—half scorn, half anger—which proved that my suspicions had been well founded.

Mr. Dana was painfully shy and nervous, looking at Edith as though asking for help; and the thought struck me that he was peculiarly sensitive with regard to his altered position, though Aunt Dorothy could not have been patronizing to any one. Shrinking and embarrassed, he got into a corner, affecting to be absorbed in an album, and I looked at him with interest. I think he remembered other days, and was doubtful as to whether the ladies Lovel and the master of Nevil Towers would be disposed to feel friendly towards General Polwyn's secretary; but I consoled myself by thinking that he and my good Branden would soon fraternize, for if any one understood sensitive natures it was he.

Edgar Dana was of middle hight and rather thin. His face, though weak, was an attractive one, and the vivid color in his cheeks deepened when anyone addressed him. His hands were small and white, the blue veins showing clearly; his eyes, gray and dark, were brightly restless. He was very young—very proud, too, in a boyish way; as the short thin upper lip betrayed.

Little by little Edith drew him into conversation, asking him what he thought of our country's scenery.

"Every one admires Kingston," said Edith; "but you ought to see Mr. Verner's garden, oughtn't he, Mr. Verner?"

"My property has no claim to antiquity in your eyes, Miss Edith," returned Nevil; "but with many modern mine may compare favorably; for instance, with General Polwyn's."

"The General is very proud of his garden," said Mr. Dana, to whom this remark seemed addressed.

"Modern improvement," said Nevil, turning to aunt, "would be out of place here at Kingston."

"There is nothing more sad," said Edgar, "than when we return to a place we have loved, to find it changed—to find that strangers have 'improved' away the spots familiar to us."

"My own opinion, Miss Lovel," cried Nevil; "but if I cared much for a place I would not leave it."

Mr. Dana seemed to have extinguished himself by his former long sentence, and silently turned the leaves of the book, the flush in his cheeks a little brighter; and Edith had got into an argument with Nevil, the subject of which I had missed by watching the young stranger.

CHAPTER VII.

"Some people are never wrong," Edith was saying.

"I do not pretend to be one of those people, and am ready to admit myself in the wrong when I am," Nevil responded, to which she replied:

"Ah! of course, when you are! Why did you stay away so long?'

"My mother was not well, and I did not care to leave her."

"You are the most self-denying gentleman I know! Do go on! I wish you'd speak of yourself sometimes."

"Well, Miss Lovel," he said, coloring, "it would be possible to find more disagreeable subjects of conversation."

"Possible, but rather difficult.

"Kate, come and play for Mr. Verner's dying to sing that new duet."

Whether he was dying or not, he sang, and thus we left Aunt Dorothy and Edgar alone; and when I glanced towards them, he was seated beside her, talking without the least restraint, and for the first time smiling. I thought that their natures were alike—gentle, sensitive, refined.

Nevil went away early, taking leave of me coldly. Mr. Dana followed with a promise to return soon, aunt having taken a fancy to him.

"He is the most innocent creature on earth!" she said, when our guests had gone. "I don't think he's strong enough for a secretary. What a pity want of money should bring such troubles!"

Edith came to my room that night, as I stood by the window, with the step of a queen—her haughty lip curling, her eyes sparkling.

"What is your opinion of Edgar Dana?"

"I like him, only he is very shy."

"He feels his position acutely, Kate, and he was made to feel it; but he is simple honor itself, and if he had been more worldly he might have hung on to his great relatives. If he had only a penny, he'd give it to the first one who met him with a tale of distress. If he had anyone to work for, he'd work hard: but he does not think it worth while for himself. There's Edgar for you! I hope you admire Paragon to-night?"—To be continued.

MAGAZINES FOR OCTOBER.

EDUCATION.—An International Magazine. Bimonthly. Contents: Frontispiece, Education and Sanitation; The Loss and Recovery of Classical Manuscripts; The Teacher's Work in the Development of Mental and Moral Power; German Universities; Real Education, Its Principles and a little known Chapter in its History. Part III; Relation of Academic to Professional Work; Notes on an Infant; Kant and his English Critics; The National Council of Education; The Concord School of Philosophy; A Crisis in American History; Miscellaneous Notes; Bibliography of Education.

GERMAN UNIVERSITIES.—What most strikes an American on visiting the German universities or colleges—for this English distinction is unknown here—is, in the first place, the unpretentious buildings that are made use of. Though Leipzig is not a large place, a stranger might walk through it from morning till night and pass and repass the university buildings without ever suspecting that inside, in dingy rooms filled with the commonest wooden benches, the foremost men of Europe, in their departments, were lecturing to young and even middle-aged men from every quarter of the globe. With us, a magnificent pile of buildings is usually the first step in founding a university; the library, apparatus, and general inner economy being two frequently matters of secondary importance. The Germans, on the contrary, rent or build a row of houses in a quiet part of the city, get together all the books and manuscripts they can afford to buy, erect as many museums and laboratories as possible, and offer perhaps modest incomes, but with a large liberty and many privileges, to talented and enthusiastic men, irrespective of creed or politics, to come and further the cause of science and learning. In short, here the instruction and intellectual advantages to be had make the university; there, in too many cases, the buildings and externals. What the Germans themselves regard as the chief characteristic of their system may be summed up in freedom of teaching, freedom of learning, method, and organization.—James Washington Bell, in education.

HARPER'S MAGAZINE.—Contents: Frontispiece, With Grandpa; A Berkshire Road; Journalistic London; The Peabody Museum of Archæology and Ethnology; Adirondack Days; Frederick A. Bridgman; The Telegraph of To-day; Cotton and its Kingdom; Anne. A Novel; Raldy. A Story of the Wisconsin River; The Mormon Situation; "Faint Heart ne'er Won Fair Lady;" A Laodicean. A Novel; Editor's Easy Chair; Editor's Literary Record; Editor's Historical Record; Editor's Drawer.

THE MEASURE OF BRIDGMAN'S SUCCESS.—It was my fortune to watch the European career of Mr. Bridgman from its beginnings, and to have forced upon my notice the disadvantages and the privileges that are peculiar to the Western Republican in earning the consideration of the world of culture which exists on the other continent. That world of culture, without meaning to do so, constitutes itself a close corporation. If the republican aspirant acquires some traces of that accent of civilization which is the freemasonary of the educated circles, his accomplishments are his reproach. He is asked, if a painter, why he does not bring into the world's art some national flavor, like the passion of Munkacsy, or the embroidery of Fortuny, instead of emulating the faded perfections of traditional art. He is charged to remain provincial at his peril. If he insists on falling into the line of art-progress in its classical development, every merit he assumes is liable to be imputed as a fault, and the suavities and accomplishments he may acquire, such as would be recognized as perfections in the European, are apt to be blamed upon him as the little hypocrisies of the renegade. That the subject of this paper has conquered a marked place, not by insisting on his foreign accent, but by competing in those pure classical themes where all contestants are equal, is so much the more to his credit. It is a harder success than are the common successes of what may be called dialect art, where only half the merit is in the hard, uncompromising test of quality, and the other half is in the piquant strangeness which excites wonder, where the award of popularity is given by those who can have no competence, merely because they are tickled, and not because they can judge of felicities and fidelities.—Edward Strahan, in Harper's Magazine for October.

THE NORTH AMERICAN REVIEW. Contents: Some Dangerous Questions; The Elements of Puritanism; The State and the Nation; The Idea of the University; Why Cornwallis Was at Yorktown; Shall Two States Rule the Union; The Ruins of Central America; Washington as a Strategist.

WHY CORNWALLIS WAS AT YORKTOWN.—When Lord George Germaine waited upon Lord North with the news of the surrender of Cornwallis at Yorktown, on the 19th of October, 1781, the minister received it, Germaine says, as he would have taken a ball in the breast, and exclaimed: "O God! it is all over!" It was not merely that a battle, or a town, or an army had been lost; it was the loss of the cause. The final military movement, which had been devised and depended upon for the subjugation of the American Colonies, had failed, and the British Empire was now hopelessly divided.

No wonder that such intelligence came to Lord North like the blow of a bullet. The misfortunes of his country, even when they were not the result of his own stupidity and obstinacy, he could bear with the most good-natured equanimity; but this announcement of a disintegration of empire was the announcement also of the defeat of party. Who could stop to think of the welfare of the people when a cabinet was in jeopardy? Had Lord North ever heard of that habitual prayer, through all those trying years of the Revolution, of a country clergymen in Massachusetts —"Deliver us, O Lord, from Lord North, the Flesh and the Devil!"—he would have felt almost ready to acknowledge that the most earnest purpose of the petition had been listened to and that Providence had gone over to the side of the rebels.—Sydney Howard Gay, in N. A. Review for October.

PHRENOLOGICAL JOURNAL.—Contents: John A. Broadus, D.D., portrait; Alaska's Promise; Studies in Comparative Phrenology, chapter IX.; Form and Growth of the Head; Welsh Preaching and What it Did; Man and Woman in Society; Two English Queens—Margaret of Anjou, Elizabeth Woodville; On Hair; Young Folks of Cherry Avenue, concluded; Hypnotism; Philosophy of Ruralism; Good Physicians; Notes in Science and Agriculture; Editorial Items; Poetry; Answers to Correspondents; Personal; Wisdom; Mirth; Library; Publishers' Notes.

HOW THE SWEDES WARM THEIR HOUSES.—Visitors to the Centennial Exposition at Philadelphia must remember the great porcelain-covered stoves which formed part of the Norway and Sweden exhibits. They attracted not a little attention, and should have taught our enterprising stove manufacturers a practical lesson. It would appear, however, that they were regarded mainly as curiosities, and quite incompatible with our American spirit of enterprise.

* * * "The fact is, that the American people are oblivious to the frightful effects that come from their system of heating, and only become aware of its discomforts and dangers after passing a Winter with English grates or the 'kakelung.' To return to the last-named system, a 'kakelung' is simply a great stove of masonry, covered with porcelain plates, having usually five flues, through which the gases of combustion must pass up and down, a distance of 30 to 50, or even 60 feet, before escaping into the air. The general principle of their operation is to provide enough material to absorb all the heat from the fire—to conduct the gases through these long flues until their temperature has fallen to a point that no longer gives off heat. The quantity of the material in the 'kakelung' is so great that the temperature from one firing (which is always enough) will not raise the temperature of any part so much that the hands cannot be held upon the outside."—Phrenological Journal for October.

APPLETONS' JOURNAL.—Contents: Saints and Sinners, Part Fifth; Sketches and Reminiscences by Ivan Tourgenieff; English and American English; French Intellectual Life; Byron, Goethe, and Mr. Matthew Arnold; An Adventure in the Philippine Islands; Two Theories of Poetry; The Meiningen Company and the London Stage; Lawn Tennis and its Players; Reviews; Editor's Table; Notes for Readers.

AN ADVENTURE IN THE PHILIPPINE ISLANDS.—Have you ever met with a Spanish *savant?* Well, I admit the species is rare, but I knew one in Manila. His name was Don Inigo Azaola, and, in all my journeyings through the different parts of the world, no more amiable a fellow has ever crossed my path. The name Azaola has been perpetuated in science by our countryman Meyen; but the splendid man who was attached to it has been sleeping these sixteen years on the Campo Santo of Manila.

It is twenty-six years now since I happened —no matter for what object—into Manila, a place which even now has many peculiarities, but which at that time bore a much more characteristic impress of the mixture of Asiatic and old Spanish customs which a more lively intercourse with other nations has since somewhat worn away, but by no means altogether effaced.

I dabbled in botany a little at that time, and old Don Inigo, who, with his scientific inclinations, stood somewhat isolated among the good people of Manila, was charmed to have found in me some one who, like himself, could grow enthusiastic over things upon which his countrymen looked down with sovereign contempt. He considered me entirely in the light of a plant, insisted that he had discovered me, and claimed the right, as discoverer, of disturbing at will my matutinal slumbers for purposes of botanical excursions, and appropriating my evenings for social intercourse.—H. H. Behr in Appletons' for October.

ATLANTIC MONTHLY—Contents: Dr. Breen's Practice, VII., VIII.; Origin of Crime in Society; Carlyle's Laugh; Martha; The Two Hamlets; The Portrait of a Lady, XLVII—XLIX.; River Driftwood; A Tropical Sequence; My Neighbor's Ring; The Katrina Saga, Part II.; Is God Good? Place de la Bastille, Paris: Dean Stanley; Some Recent Novels; The Contributor's Club; Book of the Month.

IS GOD GOOD?—A tendency to ask irreverent questions is no sign of strength. It is wholesome for us, in this day of facile defiance and hard acceptance, to remember this. In an age which fails in deference, it is a healthful thing to do, to summon our spiritual instincts to order. The bust of young Augustus in the shop window wears a lung protector; Clytie serves to advertise the "Boston battery;" and positivist writers go out of their way to address Jehovah by the familiar pronoun "you." We have not passed the period when skepticism is more apt than not to be regarded as a proof of superior intelligence, but we have reached the stage at which no intelligent mind can thus regard it without severe and honest study of its own motives. It is a lesson as old as Aristotle that philosophy is not the art of doubting, but the art of doubting well.

While the inclination to irreverence, let us repeat, is no indication of mental robustness, the courage to question accepted doctrine may be not only a proof of devoutness, but the condition of the profoundest submission to truth.

This recognition of the inherent right of every man to have the reason for what he believes, and so shake his destiny by the shoulders till he gets such reasons, is postulated today, in educated thought.—Elizabeth Stuart Phelps, in Atlantic for Oct.

GODEY'S LADY'S BOOK.—Contents: Steel Plate, Scene from Sir Walter Scott's "Tales of a Grandfather;" A Novel, Clara F. Guernsey; Shorter stories, poems and sketches, make the letter-press up to Godey's high standard. The fashion illustrations are new and numerous, and all the departments are worthy of commendation.

ESTES & LAURIAT'S Autumn Announcement has been received. It consists of a list of new books and new editions.

Send for the Fair Number of the Rural New-Yorker and the new poster for 1882. *Both will be forwarded* gratis *to all applicants.*

Domestic Economy

CONDUCTED BY EMILY MAPLE.

ECHOES FROM EVERY-DAY HOUSE.

ANNIE L. JACK.

I OFTEN try to imagine what my children would be if they had nothing to do. As it is, there is an excess of work these Autumn days, that fills every thought and hour. Cutting grapes, picking apples, taking up plants for Winter, and storing the vegetables must be done before frost. Already a cold snap the other night touched even hardy plants. The apple-tree leaves have curled up, the flowers that were left to brighten the Autumn days are scorched and withered, except a few hardy annuals. The children, too, feel the sudden change, and we "open the camphor trunk, and bring the mittens down." Colds are so easily contracted after the Summer heat, and the sudden changes of the past month have been very trying.

In this locality while picking fruit we find the greatest difficulty to procure help that will be careful in handling the apples. So "papa" has hired the children, giving them 50 cents a day while the picking lasts. Even little "Hope," who is only six years old, but strong and hearty, earns 25 cents daily by picking up the fallen apples. I think for children there is no *gift* of money so pleasant as money *earned.*

The RURAL is very proud of its prizes no doubt, as given in a late paper, and we are proud of ours, for the children of Every-day House competed with the Province of Quebec in an exhibition open to the world, and were very successful.

It would have amused an on-looker to see the examination of grapes and apples, the profound air with which old and young contemplated specimens to get the best shaped and largest, and the result was a number of first and second prizes. Then the amateur florist made up bouquets and a basket and took in three roses in pots, as well as native ferns and immortelles, besides 100 varieties of annuals as cut flowers, and came off with flying colors. First prizes were plentiful, and so were second, the money amounting to over $30, without speaking of a diploma or two, and the encouragement given by these attempts. I think if farmers and fruit growers would encourage their young people to exhibit, giving them the prize money when won, it would do more to help the advancement of horticulture, and to foster the love for country life than all the essays ever written.

One of our boys exhibited a collection of forest tree seeds, 36 varieties, all labeled and assorted into little boxes, that attracted a great deal of attention. They were shown at several places, receiving a diploma and extra prize, and one of our horticulturists writing of them says: "They drew a good deal of attention as a splendid idea not before thought of." In these days of tree planting and nut sowing it is something to be able to show, to those who do not know, the germs of all the forest.

These little things in every-day life help to make home happy, to employ the minds as well as the bodies of the children and to give them some aim in cultivation. And, mothers, when the children are troublesome, prepare, this Autumn, for them a piece of ground, tell them to save seeds, and when Spring comes, let them each have made choice of what they will grow for *profit* and for the *fair*—send for catalogues during the Winter; they help to educate the children, and I find nurserymen and seedsmen most obliging, always forwarding their catalogues in answer to a postal card, and in a year when they accumulate I have found that a fifteen-cent box of paints will keep a three-year-old child quiet for hours—in coloring the pictured flowers of Henderson's or Vick's to suit its own taste. The RURAL is doing a vast amount of good in distributing seeds to the children. Our campanulas, dianthus, gladioli, and many others received from it were valuable additions to the prize cut flowers. Make the children feel that they have an interest in the work, that they are partners in the farm, and will gain or lose by its profit or loss, and you hold the key that unlocks many difficulties, and explains much of the discontent that made Maud Muller "look to the far off town," and he who penned those lines, the gentle poet Whittier, now an old man, wrote to me this past Summer that the happiest part of his life has been "that spent in watching the growth of a tree or plant." Such words are encouraging, they show there is something purer and better than the struggles for gain in the crowded city, and that a country life, made as happy as it can be "with content is great gain."

DOMESTIC RECIPES.

APPLE DUMPLING.

Make crust as follows: Prepare and boil, as for eating, four medium-sized potatoes. When tender mash fine and to two cupfuls of potatoes add the same quantity of sifted flour. Mix together with a chopping knife so as to keep light. Now add a cupful of butter and chop in with the knife. Add salt and mix to a paste with very cold water, doing all with the knife. Have apples chopped. Divide the paste, roll into squares, put in the center of each some of the chopped apples, bring the corners together and pinch the edges. Have ready some small square cloths dipped in water and floured on the inside. Put a dumpling into each, leaving room to swell, tie up and boil an hour, serve at once. E. K.

POTATO CROQUETTES.

Two cups of cold, mashed potatoes, two beaten eggs, a tablespoonful of melted butter, salt and pepper. Mix all together and form into oblong rolls. Dip into beaten egg and roll in cracker dust. Fry in drippings, or lard and butter.

RICE CROQUETTES.

Two cups of cold boiled rice, two beaten eggs, two tablespoonfuls of melted butter, a little salt and flour to form into any shape you please. Be careful not to get the paste too stiff. Roll in flour, then in beaten egg, and lastly in cracker crumbs, and fry in sweet lard or drippings.

OYSTER PIE.

Line a pie-tin with good paste, put into a brisk oven and bake until brown. Chop a quart of oysters, thicken a cupful of boiling milk with a small spoonful of corn-starch, season with a spoonful of butter, salt and pepper to taste, put in the minced oysters, boil five minutes, stirring constantly.

STEWED CELERY.

Scrape and cut into inch bits. Cook until tender in salted water. Drain off, add enough milk to cover the celery, let come to a boil, stir in a large spoonful of butter rolled in flour; season with pepper and salt, stew five minutes longer and serve. LONG ISLAND.

CORRECTION.—In the RURAL of Oct. 15, p. 707 appeared a recipe "To Wash Bed Flannel." The word Bed should have been Red.

News of the Week.

HOME NEWS.

MONDAY, Oct. 24, 1881.

PROCEEDINGS AT YORKTOWN.—The Yorktown celebration was formally commenced on the 18th inst. and on the 19th a reception was held by President Arthur. After the opening of the exercises of the second day with prayer by Bishop Harris, Secretary Blaine introduced President Arthur who in a few well chosen words addressed the assembly. Max Outrey, on behalf of the French delegation made a brief address in which he dwelt largely on the friendly feeling existing between the two Republics. In closing he thanked the American people for the cordial welcome extended to the French representatives. Marquis de Rochambeau followed Outrey, speaking in French, and he was succeeded on the platform by Colonel Steuben, of the German delegation. Robt. C. Winthrop delivered the oration of the day, in which he paid a glowing tribute to the Frenchmen who took part in the campaign of 1781, dwelling especially on the record of Lafayette. He sketched the military career of Washington, the scene at the surrender and closed with a strong plea for the perpetuation of those institutions which our forefathers had caused to be established. On the 20th, a grand military review and naval drill were the features of the day. This virtually completed the ceremonies of the occasion. The monument will be erected as soon as it is finished.

FLOODS IN THE WEST.—Heavy floods are again visiting the West. At Dubuque, Iowa, the railroads on the river front were under water; at Warsaw, Ill., much damage is reported to crops and stock. At New Canton and Rockport, Ill., the flood came so suddenly as to take the people completely by surprise. A large area of Winter wheat is sown, which will be completely destroyed. From the 15th to the 26th all trains on the C., M. & St. P. R. R. were abandoned at Moline, Ill., and 3,000 tons of hay were afloat at that place. The lower portion of Davenport, Iowa, was overflowed. At St. Louis railroad travel was impeded, the K. & St. P. Railroad having abandoned all trains to Hannibal. Much damage has been done to property along the Mississippi.

Memorial services on the death of President Garfield were held in Boston on the 20th. Gen. N. P. Banks delivered the oration. Mayor Prince presided.

The Delta Upsilon College fraternity held its annual convention with the Brown University Chapter on the 20th inst. Hon. David A. Wells presided at the public services. Ex-Governor Blair, of Michigan, was chosen President for the ensuing year.

There is another rumor of reviving the World's Fair project in this city. It won't do for Boston to get the start of New York, you know!

Mayor Carlton, of Port Huron, Mich., has issued a card to the public thanking them for their generous contributions to the Michigan sufferers and requesting that no further donations in kind be sent in, as they have adopted the plan of distributing money; $11,000 have already been disbursed.

It is announced that Watson H. Gilder, who for the past 10 years was the late Dr. Holland's assistant in editing Scribner's Monthly, will become editor of The Century.

It has been decided that the monument of General Burnside shall be an equestrian statue and that it shall be set up in Providence. Citizens of Bristol, R. I., offered to contribute from $5,000 to $10,000, providing the statue is erected there.

The annual meeting of the Woman Suffrage Association will be held at Louisville October 25 and 26.

Cadet Whittaker now appears before the public in a new rôle. He is concert manager for colored vocalists.

One of the present freshmen class at Yale is a man of middle age. He was examined for entrance 20 years ago but went into business threafter. He now returns to take up his deferred course. Good for him!

The Grand Trunk railway is selling tickets at reduced rates from Chicago and Detroit to all points in Michigan by the Vanderbilt lines. The agent at Chicago refuses to furnish a schedule. This is the first direct cut to local points, excepting the Buffalo rates which were made some weeks ago by the same road. It is not known whether the Vanderbilt lines will meet this cut or not.

Twenty-four Mormon missionaries arrived here from Utah, on the 17th, on their way to Europe. The Mormon conference appointed a hundred missionaries, sixty of whom will go to Europe and the remainder work in the United States. Thirteen have started for the South.

In Cleveland, workmen have torn down the Garfield pavilion and the arches in the park. The dias, upon which the body lay in State, will be preserved at the Western Reserve Historical rooms. The relics will be preserved at the Capitol, at the Columbus City Hall and in the armories in Cleveland. Most of the floral emblems will be distributed as Mrs. Garfield dictates.

Insomnia.

One of the almost invariable results which follow the use of "COMPOUND OXYGEN" is to give the patient sound and refreshing sleep. A lady writes of her daughter: "The continued use of Compound Oxygen soon gave her healthy and refreshing sleep, and all anodynes are abandoned." Says a patient: "Since using your remedy my sleep is natural and good. My spirits are in a much more healthy condition. I have no need of anodynes. Another writes: "Before I commenced taking it (the Compound Oxygen) I did not sleep any at night, had no appetite, and my cough was so troublesome that I had no rest. Since I commenced taking it I have slept well at night; my appetite has very much improved; I scarcely cough at all; and, in fact, I feel better in every way." Another says: "I was perfectly sleepless, often three nights in succession, followed alternately by one night of horrible slumber, known as nightmare. Now sleep is restored, mind clearer, step firmer, all healthy action greatly increased." Another lady, referring to her daughter, says: "My daughter has improved in flesh, and looks well. She sleeps well at night—sleeps all night, a thing she was unaccustomed to do. Before taking the Oxygen, wakefulness was one of her troubles. I can see that she is much less nervous, and in better spirits." A gentleman, writing of his wife, says: "I have followed your directions as nearly as possible. Have left off all the medicines and stimulants my wife was taking, and the result of our treatment so far has been more satisfactory than anything preceding it. She has been able to sleep good at night without the use of chloral, a thing she could never do before." Our Treatise on Compound Oxygen, containing large reports of cases, and full information, *sent free*. Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.—*Adv.*

AGRICULTURAL NEWS.

MONDAY, Oct. 24, 1881.

THE following items of agricultural news are condensed from telegrams received here between noon on Friday Oct. 21 and noon today, Oct. 24: Portland, Me.—Weather fine; farmers and others paying debts freely.....Boston, Mass.—Flour and pork in good demand, but with a slight falling off from last week's prices. Wool trade heavier than in the corresponding week last year, and generally in a healthy condition. Sales of all kinds 2,650,000 pounds including 200,000 pounds of the best xx and above at 45c. Coarse carpet wools wanted at 15c@20c. Combing and delaine firm at 47c@50c. Pulled wools firm at 33c@50c.....Philadelphia, Pa.—Receipts of produce falling off and prices again tend upwards. Wheat, corn and oats unsettled in sympathy with fluctuations at the West.....Cincinnati, Ohio.—Grain market sympathizes with Chicago. Wheat 1c@2c lower than at same time last week. Corn 4c@5c lower. Receipts of tobacco during the week show improvement in quality; prices better.....Cleveland, Ohio,—Grape season nearly over; yield rather less than usual; quality a trifle off, but prices will make this an average with other years. From winter's losses of vines, drought, and anxiety growers' enthusiasm is dampened, so fewer new vines than usual will be planted this Fall and next Spring. Potatoes scarce, $1@1.05 on track; $1.10@1.15 in warehouse per bushel. Fruit scarce, choice picked apples $3.50@3.75 per barrel. Beans very scarce, though hand-picked marrow sell for $3.75@3.85 per barrel.....Louisville, Ky.—Produce firm and active; wheat $1.15; corn No. 2 white, 78c, do. mixed 71c. Oats No. 2 white, 48c, do. mixed 46c. rye No. 2, $1.18. Leaf tobacco market still strengthening, offerings still very light; consignors waiting for better prices.....Detroit, Mich.—Lumber exceedingly active; prices firm with upward tendency. Pine lands booming, thousands of acres changing owners. Lake freights dull; rates half of last year's. Wabash road about to build at once a million bushel elevator; existing storage capacity 1,300,000 bushels. Wheat No. 1 white, $1.37⅛, cash; No. 2 red, $1.40⅛; No. 2 white, $1.34⅛. Corn high mixed 67c. Oats No. 1 white, 48c. Clover seed—prime, $5.35.....Evansville, Ind.—Tobacco season about closed; yield estimated at about half the usual crop. Late rains, causing rapid growth, make the grade coarse and inferior.....Chicago, Ill.—grain receipts not so heavy owing to bad country roads throughout the Northwest from late heavy rains and present floods. Less speculative activity; prospect good for quiet market for some time. Tendency in cereals generally a little upward; but hogs and cattle are selling at lower prices and the outlook just now is downward. Receipts of breadstuffs for the week 116,138 barrels of flour; 274,102 bushels wheat; 1,596,510 bushels corn; 486,897 bushels oats. Shipments, 97,019 barrels flour; 170,894 bushels wheat; 2,097,284 bushels corn, and 272,744 bushels oats, so that stock of all cereals, except corn, is increasing.....Peoria, Ill.—Weather clear and cold. The Illinois State Agricultural Society closed here on Thursday, having been largely attended from all parts of the State. Much freight blockade.....Milwaukee, Wis.—The unsettled condition of the grain trade is having a depressing effect on general business. In some parts of the State unharvested crops have been injured by continued rain. All cereals are either dull or lower. Provisions and hogs are dull.....Minneapolis, Minn.—Rained four days this week. In spite of bad weather and worse roads farmers are delivering grain freely. The Millers' Association bought 600,000 bushels during week, Market has declined 3c. Flour quiet; 96,500 barrels shipped in last six days. Farmers badly behind with work all over the State. Rivers and streams higher than ever known at this season. Lumber active; a large amount of logs will be carried over the winter. Trade checked by bad roads, debts being well paid as produce moves.....St. Louis, Mo.—Freight blockade still tighter. Switch yards covered with loaded cars owing to faulty local transportation. Grain has tumbled all round, in spite of bad reports of Fall wheat planting and damage to corn by rain. Causes of decline are: Over-crowded elevators, therefore no room for storage, and fears of extra charges; prices too high for profitable export and prospect of speedy close of navigation. Tobacco boom has "busted." Provisions exceedingly dull. Cattle receipts small; quality poor; prices lower. Horse and mule market at a stand-still owing to "Pink-eye." Good game coming in rapidly. River high and rising, levees in danger. Except as to crops situation as bad as last Spring.....Kansas City, Mo.—Weather very wet. Country merchants are paying promptly and have lots of cash, showing that farmers are doing well. Much inconvenience from freight blockade.....Omaha, Neb.—Pleasant Autumn weather now. Prices of produce steady for the week. Bad condition of country roads hinders business of all sorts. Last week's rains stopped thrashing. Wheat was damaged in stack; loss not great. Most counties report a larger corn crop than was expected.....Denver, Col.—Flour and feed quiet; produce active. Supply of hay large; fall in price of home growth. Vegetables firm. Hides and tallow active. Country buyers in crowds to buy winter stock. Large purchases of wool by Eastern buyers. Of cattle 100 car-loads were shipped from Trinidad during the week. Splendid weather.....San Francisco.—Wheat touched $1.77¼ per cental, but dropped one cent. Wool stagnant.....Baltimore, Md.—Orders for canned goods far ahead; shipments behindhand. Canned tomatoes, $1.30, an advance of 25c per dozen. Green corn 10c. per dozen higher. Canned peaches $2.80@$3 per dozen compared with $1.65@$1.75 last year. No prospect of a decline in these prices. Small fruits all sold out. Prime grades of Southern wheat in demand; low grades dull. Western wheat lower. $1.45½@$1.46 cash to $1.56¼ for Jan. Corn steady, prices firm. Southern white, 74c for new; 77c for old.....The steamer Leipsig from Bremen, Germany, has just bought 8,000 cabbages from Oldenburg—the first European importation of vegetables ever brought here.....Norfolk, Va.—Cotton coming in very freely from the far South and West.....Richmond, Va.—Prices of all vegetables and breadstuffs are high; but it is thought to be due to the fair, and when it closes a decline is expected.....Charleston, S. C.—A cool spell the last two days—turpentine up to 50c.....Savannah, Ga.—Cotton market opened firm on Wednesday afternoon with a strong demand on Thursday with prices hardening.....Augusta, Ga.—Farmers have had a good season for planting crops. Most of the cotton gathered is of good quality. Over $600,000 in the King Cotton Manufacturing Company have been subscribed. All the mills running full time with orders for ahead.....New Orleans, La.—Cotton strong, fully up to former rates. The first of this season's sugar arrived last Monday—12 days later than first arrival last year.....Memphis, Tenn.—Light frosts have fallen. Prices of provisions and produce lower than for some time past. Cotton receipts falling off owing to extra efforts of planters to pick the crop before wet weather sets in.....Nashville, Tenn.—Wool market dull with light receipts. Corn, oats and hay quiet; prices unchanged.

The Austrian consul's in Servia report the harvest this year extremely unfavorable. Not more than half as much as the crops of last year have been gathered in this year's harvest. This serious failure is attributed partly to destructive frosts, and partly to the wide prevalence of blight. From Roumania the reports are very much to the same effect as those referring to Sorvia. In most parts of Moldavia and Wallachia the yield is not half the average.....A correspondent of the Amador, Cal. Dispatch says that there are from 60,000 to 80,000 acres of fine grape land in that county which need but enterprise and industry to yield an annual income of $2,000,000. And yet men living on some of this very land are barely making a living because they have not the energy to develop its resources..... The United Kingdom in 1880 consumed 8,650,000 gallons of French wines, against 5,620,000. in 1876. The rate of consumption continues during the current year.....

An Indianapolis exchange mentions that St. Jacobs Oil cured Mr. J. H. Mattern, a letter-carrier of that city, of a severe sprain, contracted in the war.—Detroit (Mich.) Western Home Journal.

Cause and Effect.

Disease never comes to us without a cause. Ask any good physician the reason and he will tell you something interferes with the working of the great organs. Kidney-Wort enables them to overcome all obstructions and preserves perfect health. Try a box or bottle at once.—Mirror and Farmer.

Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., is rapidly acquiring an enviable reputation for the surprising cures which daily result from the use of her Vegetable Compound in all female diseases. Send to her for pamphlets.

All the prize lots of butter, eighty-three in number, of the recent London Dairy Show were salted with Higgin's Eureka Salt. The Higgin process has revolutionized the dairy salt business of Great Britain.—American Dairyman.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is enough. Price 25 and 60 cents per box.

Garfield and Family—elegant engraving 19 by 24—sent for 24c. (stamps). Sheehy & Co., 33 Barclay St., N. Y.

Burnett's Cocoaine

Softens the hair when harsh and dry.
Soothes the irritated scalp.
Affords the richest lustre.
Prevents the hair from falling off.
Promotes its healthy, vigorous growth.

The Markets.

SPECIALS FROM THE CHIEF CENTERS

Until Saturday, October 22.

CHICAGO.—WHEAT moderately active and higher; No. 2 Chicago Spring, $1.34½@1.34¾ cash; $1.35 October; $1.35⅞@1.36, November; $1.37¾ December; No. 3 do., $1.20. CORN fairly active and a shade higher at 61@61⅛c., cash; 61¼@61⅜c., October; 61¾@61⅞ November; 63⅛@63¼c. December. OATS moderately active and higher at 44c., cash; 44¼c., November; 44⅝c., December; 48c., May. RYE easier at $1.02¼. BARLEY firm at $1.05⅛@1.06. PORK steady with a fair demand at $16.85@17, cash; $16.80 November; $16.90@16.95, December; $17.95@17.97½ January. Lard fair, active, and a shade higher at $11.62½@11.65 cash and November; $11.75@$11 77½, December; $11.92½@11.95, January. Bulkmeats stronger; shoulders, $7.50; short rib, $9; short clear $9.40. HOGS—demand good and prices firmer, but not higher; mixed packing, $5.70@6.35; choice heavy, $6.30@6.90; light $5.90@6; culls and grassers, $3.75@5.50. CATTLE—market weak and dull; exports $6.40@7; good to choice shipping, $5.40@5.90; common to fair $4@5; butchers' cows, $2@4.50; bulls, $2@3.50; oxen, 3.50@4; steers, $3.50@4.50; stockers and feeders, $3@4.

$2,000 Worth of Valuable Gifts

For those who raise the best crops from the Rural New-Yorker's Free Seed Distribution of next year!

Its Free Seed and Plant Distributions during the past four years, have placed in the hands of farmers and horticulturists some of the most valuable farm and garden plants in cultivation.

Its Experiment Farm (the first to have been established in connection with journalism), is worked in the interest of its subscribers.

The Fair Number of the Rural New-Yorker explains all. It will be sent to applicants free.

You should subscribe for the Rural New-Yorker. It is a national weekly 16-page journal, with over 500 Original Illustrations per year. The best artists---the best writers. Ask those who know. Address **34 Park Row, New York.**

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Oct. 22, 1881.

BEANS AND PEAS.—Supplies of beans came forward freely and buyers have in some cases obtained a trifle off. The general feeling, however, is firm. Stock is believed to be mainly out of growers' hands, though farmers have been able to utilize the full crop as the weather has been very favorable for thrashing. Peas of all kinds are tending downward. Green Wis. $2; Southern B. E. peas $3 ₽ 2 bu. bag.

Marrow beans, new, $3.35@3.60; mediums, $3.50@3.55; pea, $3.40@3.55; white kidney, $3.55@3.60; black or turtle soup, $2; red kidney, $3.10@3.25.

Receipts of beans for the week, 21,250 bush.
Exports do, 446 bbls.

BEESWAX.—Dull at 21@22c.

BUTTER.—The market keeps in about its former groove, fine grades selling while under grades drag. Exporters are not in want of stock. All prime Western sells upon arrival, and the demand for Western imitation creamery seems well established.

Creamery, State and Elgin, choice, 36@37c.; good to prime, 34@35c.; sweet cream, fresh, 32@34c.; fair to good, 28@32c.; State, June, good to prime, 26@28c.; poor to fair, 24@25c.; Western, choice, 31@33c.; good to prime, 30@30c.; fair to good, 28@30c.; poor, 18@23c.; June, prime, 26@27c.; fair to good, 22@25c.; State dairies, choice, 28@29c.; good to prime, 25@27c.; fair, 23@24c.; State dairies, half tubs and pails, choice fresh, 32@33c.; good to prime, 28@30c.; fair to good, 24@28c.; Welsh tubs, choice, fresh, 31@33c.; good to prime, 27@29c.; fair to good, 24@27c.; poor to fair, 18@24c.; Western imitation creamery, 26@30c.; Western dairy, fresh, choice, 27@29c.; good to prime, 23@25c.; fair to good, 20@23c.; poor to fair, 17@20c; factory and ladle-packed, Iowa, fine June, 18c.; Ohio and Indiana, 17c.; June, good, 16@16½c.; late made, good, 16½@17c.; fair, 15@16c.

Receipts for the week, 33,150 pkgs.
Exports do. 2,672 do.
Cold storage to G. B., 90s.

CHEESE.—The tame, uninteresting condition of the market that has ruled for the past month or more continues. Some nice September cheese are showing, but the quality is off from the expected standard and the few shippers that appear for small orders offer nothing higher than has been quoted for top grades right along. July and August cheese are neglected by exporters; some have gone abroad on owner's account; Ohio cheese not running fine in quality; some old low-grade skims are offered at buyers' figures.

State factory, flue, Sept. 13c.; good to prime, 11½@12c¼.; fair to good, 10½@11¼c.; poor to fair, 9½@10½c.; Ohio factory, flat, fine mild, 12@12½c.; good to prime, 10½@11c.; fair to good, 9@10½c.; creamery, partly skimmed, choice, 10@11¼c.; poor to good, 4@7c.; fully skimmed, 2@3c.; full-skimmed factory, 2@3c.

Receipts for the week, 40,911 pkgs.
Exports do, 22,093 do.
Liverpool cable, 57s.
Steam to Liverpool, 10s. 6d.@15s.

COTTON.—A more settled feeling abroad has steadied the market for spot and early futures. Liverpool buyers are calling for closer to their usual wants than before and our own operators are operating with more confidence in all the early deliveries. Market closes fairly strong.

Futures quiet, closing steady at an advance of 1 to 2 points, against 4 to 6 points early in the day; sales, 110,000 bales.

October, 11.40@11.46c.; November, 11.41@11.43c.; December, 11.55@11.65c.; January, 11.71@11.83c.; February, 11.89@11.98c.; March, 12.01@12.14c.; April, 12.11@12.27c.; May, 12.29@12.38c.; June, 12.42@12.48c.; July, 12.60c.

Receipts for week, 42,550 bales.
Exports do. 10,281 do.

DRIED FRUITS.—Evaporated apples have advanced. All apples are held firmly. Peeled peaches strong; unpeeled pressed some for sale. Small fruits steady with moderate stocks.

Apples, evaporated, new, 13½@14c.; fair to prime, 12@13c.; N. C. new, sliced, fancy, 8½@9¼c.; fair to choice, 6½@8c.; Southern quarters, choice, 6@7½c.; State, old, fine cut, choice, 6½@7¼c.; quarters, do. 6½@7c.; small lots, 6¼@6¾c.; Ohio and Mich. choice, 6½@7c.; Western, fair to good, 5¾@6¼c. Peaches, evaporated, peeled, old, 35@40c.; unpeeled, new, 18@20c.; N. C. peeled, fancy, 21@23c.; choice, 20@23c.; Ga. 22@23c.; Southern, peeled, fair to good, 18@20c.; unpeeled halves, N. C. 8½@9c.; halves, Tenn. 8½c.; quarters, 8¾c.; Plums, State, black, 17c.; Southern Damson, 15@15½c. Blackberries, 13c. Cherries, Southern, dry, 19@20c. Raspberries, 28@29c. Huckleberries, 15@15½c.

EGGS.—Receipts for the week, 7,663 bbls.; do. last week, 8,839 do. A good market prevails; trade is not really steady at the high prices, but the quotations are latterly supported by moderate receipts.

Near points, 27@28c.; State and Pa. 25@26c.; Canadian, 24@24½c.; Western, 24@24½c., under grades 22@23c.; limed State 21@21½c.; Western, 20@21c.

FLOUR.—A few of the locally established brands show some steadiness, but the bulk of the offering are in buyers; favor and have not at all rallied from the prostration noted in our last. The trade does not expect much if any recovery while visible wheat shades the market in the lack of export movement. Rye flour has sold freely. Buckwheat flour scarce and the market opens slowly with the high rates that rule.

No. 2, $4.15@4.75; State and Western, superfine, $5.15@5.65; city mills, extra, $7.25@7.50 Spring wheat, extra, $5.75@6.10; Spring XX and XXX, $6.25@7.75; patents, $8@9.50; Ohio round hoop shipping, $6.10@6.40; trade brands, $6.50@7.20; St. Louis extra, $6.25@6.65; do. double extra, $6.75@7.35; do. family, $7.50@8.00; Southern extra shipping, $6.25@7.00; do. XX and family, $7.25@8.25. Rye flour, superfine, $5.65@6.00; buckwheat flour ₽ 100 lbs. $3.80@4.10. Corn-meal, Brandywine, $3.90; do. Western, $3.40@3.80.

Receipts of flour for the week, 109,930 bbls.; corn-meal 3,626 do.

Exports of flour for the week, 57,573 bbls.; corn-meal 4,141 do.

FRESH FRUITS.—Apples are scarce and firm. Exports for week 2,150 bbls. Pears in large supply again and favoring buyers. Cranberries sell with light supplies of apples helping them. Quinces in better demand. Grapes steady when prime. Peanuts continue quiet and firm; stock much reduced. The receipts of new so far have been of inferior quality and sold at about ⅔c. Hickory nuts are in good demand, light supply and higher. A few Western nuts have arrived and sold at $1.25@1.50; very few are good enough to reach the outside figure. Chestnuts plentier and lower; demand slack. Receipts from the south are generally wormy and undesirable.

Apples, Baldwin, State, ₽ bbl. $3.25@3.50; Jersey, $3@3.25; Greening, State, $3.25@3.50; N. Spy, do. $3.25@3.50; Fall apples, do. red varieties, $3.50@4.00; State, green; $3.25@3.50. Pears, Sheldon, Western N. Y. ₽ bbl. $5.00@6.00; Beurre Bosc $6.00@8.00; Duchess, $4@5.00; Lawrence, $3@5; Beurre d'Anjou, $5@6; Seckle, choice, $7@8; fair to good, $3@6; ₽ keg, $2@4; Vicar of Wakefield, ₽ bbl. $2.50@3.00; cooking, $2.00. Peaches, New Jersey and up-river choice ₽ bskt, $1.75@2.00; prime, $1.25@1.50; fair $1@1.25; culls, 75@80c. Quinces, apple, prime ₽ bbl. $3@6; No. 2 ₽ bbl. $3@4. Grapes, Del., State, bskts, choice, ₽ lb, 9@11c.; Catawba State, bskts, ₽ lb, 6@9c.; Concord, State, in bskt, ₽ lb, 3@5c.; up-river, loose, ₽ lb, 3@4c.; Isabella, State bskts, 3@3½c. Cranberries, Cape Cod, fancy, large, ₽ bbl. $9.50@10; good to prime, $8.50@9; do. poor to fair, $7@8; frosted $3.50@4; ₽ crate, $3@3.50; Jersey, fancy, ₽ crate, $2.75@3; good to prime, $2.50@2.75; fair to good $2@2.25; do. poor to fair, $1.50@2.

Peanuts, Va., hand-picked, ₽ lb, 7¼@7½c.; fancy, 6¾c.; extra prime, 6½c.; good to prime, 5½@6¼c. shelled, 5½@6c.; pecannuts, 9@11c.; hickory, shell-bark, new, ₽ bu; $1.50@1.62; chestnuts, Southern, ₽ bu. $5@5.50; northern $6.50@7.

GRAIN.—Wheat has kept its declining course, and possible heavy supplies have quenched the few animated sessions that have occurred on 'Change. At one time the deliveries at points of collection were larger than elevator resources could accommodate. Advices from abroad are not encouraging. In fact, it would seem as if Great Britain has deserted us for other points of supply and it is certain that strong trade-checking rates have given for the moment an inlet for other wheat producing countries.

Corn, though relatively high for that grain, has, in comparison with wheat, been attractive for the shipping demand and a good export movement is reported. Unfortunately the No. 2 styles are not in liberal stock. Oats have hardened somewhat in price, as the wants of the market are naturally enlarging.

Wheat, Spring, $1.32@1.45; Spring No. 2, $1.41@1.43; red Winter No. 2, $1.51@1.51½; red Winter, $1.49@1.53; white Western and State, $1.35@1.48. Rye, $1.02@1.06. Oats, white No. 1, 50½@51c.; No. 2, 53@53½c.; No. 3, 49@49½c.; mixed, No. 1, 47½c.; No. 2, 46½@47c.; No. 3, 43@45c. Corn, Western mixed, 67@71c.; No. 2, 71½@72½c.; yellow, 70@73c.; white, 72@75c. Barley, Canada No. 1, $1.13@1.16; do. bright, $1.16@1.18; State 4-rowed, 95c.@$1.02½. Buckwheat, 95@98c.

Receipts for the week, wheat, 973,200 bush.; corn, 491,000 do.; oats, 147,000 do.; rye, 31,825 do.; malt, 45,850 do.; barley, 305,000 do.

Exports for the week, wheat, 669,350 bush.; corn, 732,700 do.; oats, 3,933 do.

HAY AND STRAW.—There is an improved demand and with moderate receipts prices for hay and straw close firm, the latter a trifle higher.

Prime Timothy hay, ₽ 100 lbs., $1.05@1.10; medium Timothy, 90c.@$1; shipping grades, 65@70c.; clover mixed, 70@80c.; clover, 60@65 c.; Straw, long rye, 80@85c.; short rye, 55@60c. oat and wheat straw, 40@45c.

Exports of hay for the week, 875 bales.

HONEY.—There is a fair trade in a small way. Fancy small boxes clover, 19@20c.; other sizes 15@18c. buckwheat, 12@15c.

HOPS.—Prices in this city have lost the upward tone of last week. Most of the free receipts are going abroad on country bought account. Many of these parcels have been obtained at 25c. in the interior. Brewers are taking only small quantities for prompt use.

Crop of 1881, choice, 28@29c.; good to prime, 26@27c.; fair to good 23@26c.; eastern, 22@27c.; 1880, good to prime, 18@23c.; poor to fair, 12@15c.; 1879 fair to prime, 10@15c.

Receipts for the week, 8,592 bales,
Exports for the week, 1,831 do.

MILK.—Surplus commission cans of forty quarts have sold out from day to day at $2. Milk arrives in good order and the supply is ample for all uses.

POULTRY AND GAME.—Turkeys and fowls are lower. The weather does not support the free receipts of the moment.

Turkeys, Phila. prime, 14@15c.; State and Western dry-picked, 12@13c.; scalded, 11@12c. Chickens, Phila. spring, 16@18c.; Bucks Co. do. 14@16c.; Jersey, do. 13@14c.; State, do. 12@13c.; Western, do. 11@12c. Fowls, Phila. dry-picked, 14@15c.; Bucks Co. 12½@13½c.; Jersey, 12@12½c.; State and Western, dry-picked, 12@12½c.; scalded, 11@12c.; inferior, 10@11c. Ducks, Spring, Phila. ₽ lb, 16@17c.; Jersey and Bucks Co. 14@15c.; State, 13@14c.; old, fair to good, 10@12c. Geese, Phila. dry-picked, young, 14@15c.; do. old, 10@12c.; Western, old 8@10c. Squabs, white, ₽ doz. $2.50@3.75; dark, $1.50@1.75.

Cooped stock is plenty and prices have ruled low all the week. Cheap figures have started up trade at the close.

Chickens, Jersey, spring, ₽ lb. 11c.; State and Penn. 10@11c.; Western, and Southern, 10c.; Fowls, Jersey, State & Penn. 11c.; Western and Southern, 10c. Roosters, old, 5@6c. Turkeys, Jersey and Penn. 10@12c.; Western, 9@10c. Ducks, Jersey, extra-large, ₽ pair, $1@1.25; Jersey, New York and Penn. 80@75c.; Western, 50@60c.; Southern, 50@55c. Geese, Jersey, $1.50@1.75; N. Y. and Penn. $1.25@1.50; Western mixed 87c@$1.12; Southern, 75c@$1. Pigeons, large, strong birds, 30@35c.; young, 25@30c.

Fine pkgs of game are steady and prices are more popular. Wild ducks are firm for Canvas-back at $2 and Red head at 75c. ₽ pair; Mallard at 60@65c.; teal and wood at 40@50c. and common at 30c. Venison is in good request and steady.

Grouse, choice, ₽ pair $1.12@1.25; soft, 50@75c.; partridges, State and Western, $1@1.12; Eastern, 75c.; soft, 50@62c.; woodcock, choice, 75c.; inferior, 40@50c.; English snipe fresh-killed, ₽ doz. $1.50@1.75; plover, do. $1.50@1.75; venison, Minn. short saddles, ₽ lb. 19@20c.; Western, 17@19c.

PROVISIONS.—Hog products have not received the export support that the close of last week promised, and prices are wavering again. Large quantities of ready bacon at the West has a depressing effect upon the provision trade and in the opinion of the trade most of it will have to be loosened before prices can be named with crispness. Beef and beef hams doing well with reduced stocks.

Pork, prime mess ₽ bbl. $17@18; extra prime, ₽ bbl. $16@16,50; Western mess new, $18@18.25. Lard, steam Western, ₽100 lbs., $11.85@11.90; prime city, $11.80. Hams, smoked city, ₽ lb. 13@13½c.; pickled Western and city, 12½@12¾c.; Shoulders, smoked city, 9@9½c.; pickled, 8@8¼c. Rib bellies, pickled, 10@10½c. Bacon, long clear Western 9¾@10c. Beef, Western mess, ₽ bbl. $12; packet $11; India mess, ₽ tce. $25.00@27.00. Beef hams, ₽ bbl., $21.

Receipts for the week—Beef, bbls. and tcs. 1,025; pork, bbls. 5,600; cut-meats, pkgs 20,602; lard, do. 16,646.

Exports for the week—Beef, bbls. and tcs. 3,250; pork bbls. 3,050; cut-meats, lbs. 4,580,638; lard do. 6,130,982.

RICE.—Quotations are for
Carolina, choice, 7¼@7½c; good to prime, 6¼@7¼c; common to fair 5½@5¾c; prime, 7¼@7¾c.

SEEDS.—Clover seed is held more firmly; holders of car lots could probably sell at 9c., but refuse that price. Exporters have paid 9¼@9¾c. for choice selected seed from store, but are not at the moment making many inquiries. Considerable seed is said to have been recently lost at the West by the wet weather. Timothy quiet.

Clover, Western, car lots on track, 9@9¼c; Timothy: job lots in store, $2.95@3.25; Flaxseed, American, rough, ₽ bu. $1.45@1.47½.

Receipts for week, 10,956 bu.
Exports, 5,446 do.

SUGAR.—Quotations are for:
Cut loaf, 10¾c.; crushed, 10¾c.; powdered, 10¼@10¾c.; granulated, 10c.; confectioners' A, 9¼c.; coffee A standard 9¼; off A, 9¼@9½c.; white extra C, 8¾@9c.; extra C, 8¼@8⅝c; C, 7¾@8¼c.; yellows, 7@7½c.

TOBACCO.—Kentucky quiet, unchanged; seed leaf fairly active. 1880 Pennsylvania, 10@18c; 1880 New England wrappers 14@28c.

VEGETABLES.—Exports of potatoes, 3,100 bbls.; of onions, 100 do. The general demand for potatoes is not so sharp as it was and receipts are heavy enough to form some accumulation. Prices quoted very full. Sweets dull at easier prices.

Potatoes—Early Rose, Eastern, ₽ d.-h. bbl., $3; L. I. $2@2.25; State, $2.75; do. bulk, ₽ bbl. $2.50@2.62; Prolific, Eastern, d.-h. $2.75; Snowflake, State, d.-h. $2.62@2.75; do bulk, $2.50@2.63; Burbank, $2.50@2.62; do. L. I. $3@3.25; Peerless, State, $2.25@2.50; sweet potatoes, Va, yellow, $2@2.25; Del. River, $2.50@2.75; Jersey, $1.75@2.

Cauliflowers are very variable in quality, hence the wide range. Cabbages have advanced. Other items firm, though onions are not moving actively.

Onions, white bulk, ₽ bbl. $4@4.50; yellow, $2.50@2.75; red, $2.50; Chester, $2.50; tomatoes, L. I. ₽ bush. 75c.@$1; squash, Marrow, ₽ bbl., $1.50@1.75; Hubbard, $1.75@2; cabbage, ₽ 100, $5@12; beets, L. I. ₽ bbl. $2@2.25; carrots, $1.25@1.75; turnips, Russia, $2.50; cauliflower, $1@6; pumpkins, ₽ 100, $1@8; celery, ₽ doz. $1.75@2.

WOOL.—The movement in fine wools has not kept the pace that was expected. These grades have not yet declined but they have sunk into a quiet that is symptomatical of an easier feeling. The common grades have already weakened and concessions have attended such trade as has transpired. It must be remembered, however, that unusually brisk selling period has been secured this Fall and the present lull will be severely felt.

LIVE STOCK MARKETS.

NEW YORK, Saturday, Oct. 22, 1881.

BEEVES.—Receipts for the week, 17,108 head: do. last week, 16,145 do. It has been a notably light week in the sales of dressed beef and butchers have quite neglected the market for cattle. A good deal of stock remains unsold at the close. Texans and Colorados sold at 7@8¾c. to dress 55 lbs.; poor to choice natives 7¼c. to dress 55 lbs. to 12½c. to dress 57 lbs. A few extras made 13c.

MILCH COWS...The market retains the firmness that has been noted for several past weeks. The current ranges are $35@50 for common to fair, and $55@70 for good to choice—the latter wanted at full figures.

VEAL CALVES—There is a good demand for all nicely fed stock. Medium milk, buttermilk and grassers slow at prices.

Live calves, N. J. choice, 9¼@9½c.; do. State, 9@9½c.; poor to good, 6@8¾c.; Mount Hollys, 7@9¼c.; buttermilks, 4@4½c.; grassers, 2¾@3¼c.; up-river hog-dressed 13@14c.

SHEEP AND LAMBS.—Receipts for the week, 42,275 head; do. last week, 35,962 do. Trade has ruled dull and many lots have been carried over. At the close prime sheep were steady; low grades declined. Sheep range 4@5¾c.; lambs, 5½@6¾c.

SWINE.—Receipts for the week, 35,334 head; do. last week, 25,621 do. Arrivals are large, and with plenty to come buyers have had the advantage all the week. Quotations $6@6.62 ₽ 100.

New Jersey pork, light, 9@9½c.; other weights, 8@9c.; city dressed, 8½@8¾c. Pork tenderloins, 13@14c.

Terms for 1881.

The NEATEST and most PRACTICAL thing ever seen. Pleases everybody. Every family wants one. No one after using will be without for many times its cost. ☞The Round Pans being hinged separately, each cake can be turned into the long pan as soon as it is sufficiently done on one side, and the round pan returned ready for another cake. The Griddles are made of cast-iron and weigh 4 lbs. Sample griddle by express in shipping box 60c; by mail registered $1.25. POSTAGE STAMPS TAKEN. Send for sample griddle and terms to agents; canvass your town right away, you will be surprised at the great number of orders you will get. Address F. M. VAN ETTEN, Manuf'r, 208 LaSalle St., Chicago, Ill.

For the Young.

RAISING SEEDLING GRAPES.

I DARE say there is not one among you that does not like good, ripe grapes—and I still further dare say that there is not one among you who would not feel proud if you succeeded in raising from the seed, a vine that bore grapes as good as, or better than, those which grow in your own or neighboring gardens or vineyards. I would be very glad if I could induce every member of the Horticultural Club to make the trial. A sunny southern window is all that is needed. Procure six-inch pots, give ample drainage by covering the holes with broken pieces of pots or stones, then fill up with good, sandy soil. Plant three seeds in each pot an inch deep—do not allow the soil to dry out and yet do not keep it wet. Plant the seeds as soon as taken from the grape, otherwise they will dry and not sprout readily. Place the pots in a sunny southern or eastern window. Some of the seeds may germinate in three weeks, while others may require one or two months before they appear. By next Spring they will have made a growth of from one foot to 18 inches. They may then be planted in the open ground. In the Fall cut the wood back to two eyes and cover with straw lightly. The next Spring permit but one of these buds (the stronger) to grow thus confining the seedling vine to *one* shoot. So grown, most of the vines will fruit the third year. If white grapes are preferred, select seeds from white grapes. This would not insure white fruit in the seedlings, but a greater percentage would prove white than if seeds from black grapes were planted.

This is not a difficult experiment and is worth trying. You know the professional fruit raisers think they do a very praiseworthy thing when they originate from seed some new variety which proves to be a good one, but there's no use in their having all the praise for doing what any industrious member of the Club may do under similar circumstances. Wouldn't it be glorious if some one of the cousins should succeed in raising a new grape that should equal—ah, no! surpass—even the best now cultivated! It isn't impossible, and if you don't succeed the first time try until you do. Parents should encourage children in this kind of work, and assist them in their endeavors to learn how to propagate all kinds of fruits. It will be time well spent. U. M.

SOMETHING MORE ABOUT GRAPES.

I SUPPOSE that no garden can be called complete unless it has one or more grape vines placed where the sun will shed its genial rays and fill the clusters almost to bursting with sweetness. There are two varieties of the wild grape in this vicinity, one called Pigeon Plum, which is small and black; the other is nameless so far as I know. It is larger than the first, and is a dark red in color. Neither of them is disagreeable, but it seems rather strange that the Norsemen should have valued them so highly as they did when they first came to this country. All the grapes which are cultivated here excepting those which are raised under glass, are said to be descended from native vines, but the European vines grow without protection in California. Foreign grapes are particularly distinguishable by the fact that the pulp adheres to the covering.

The grape has many enemies, both insects and parasites, but with the exception of a little mildew our vines are free from them. There is a worm, however, a distant relative of the ordinary caterpillar, [A little indefinite.—U. M.] which is very fond of the stems of the grapes and cutting out a piece of the stem is, on the whole, rather embarrassing, to say the least, to the bunch of fruit which depends from it.

Probably the two worst enemies of the vine are mildew and phylloxera, the latter having been introduced into Europe from America (?). Sulphur is very highly recommended for the first of these two: for the latter, two remedies seem to have been successful. One of these is to submerge the roots for a month in the Winter time; the other is to apply a weak solution of sulphocarbonate of potash.

Grapes will rarely grow to any extent outside the temperate zone being limited to 10° north of Boston, and 16° south. Beyond these limits it is necessary to place them under cover, as too powerful heat is as bad as too much cold. Even for some degrees inside their northern limit the fruit is small and insipid, so that it is hardly worth cultivating.

Chelsea, Mass. C. A. BUTTERWORTH.

YOUNG QUERIST.

M. N. B., Cedar Mills, Minn., wishes to know how much trimming a vine should receive each year. Some nurserymen say "cut back to within two or three buds of the previous years growth." I should think that would be too severe.

ANS.—The advice given is as good as may be. One vine can ripen only just so much fruit without injury. If permitted to ripen more, the grapes are smaller and the bunches loose.

D. A. L., Havana, N. Y., wishes to know what kind of tobacco is best adapted to this climate.

ANS.—The Connecticut Seed-leaf is probably the best for your vicinity. The Glissner, Ohio Broad-leaf, Lancaster and the "Brand" are recommended by G. A. Goff, Jr., Elmira, N. Y. Write to him concerning best varieties, seed, etc.

W. C. B., Buckeye Centre, Ill., inquires if a lemon tree will bear fruit without budding or grafting.

ANS.—Yes. But it *may* be many years.

In answer to Harry F., Elmira, N. Y., p. 662 I would say that Pyrethrum roseum does blossom the first year from seed, and plants more than one year old often blossom twice a year; but as regards bearing seeds that is an uncertainty in young as well as old plants, still plants raised from seed in Spring often bear seed the first year. F.

Scientific.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

BULLETIN NO. 67, OCT. 15, 1881.

652. Canada ashes, sampled and sent by Robert S. Cone, Moodus, from cargo of 1,000 bushels (barge A. P. Wright) purchased of James A. Bill, Lyme. Price 17 cents per bushel.

ANALYSIS.

Potash	1.05
Soda	.50
Lime	34.65
Magnesia	2.68
Oxide of iron	1.49
Phosphoric acid	.88
Sulphuric acid	.20
Sand and insoluble matters	8.61
Charcoal	2.27
Water	24.25
Carbonic acid and loss	23.42
	100.00

The composition is that of good leached ashes.

655. Impure limestone, sent by N. B. Bill, Williamantic.

CHEMICAL ANALYSIS.

Lime	20.28	
Magnesia	.43	
Potash	.03	
Soda	.30	
Oxide of iron	1.89	
Sulphuric acid	trace	
Soluble in strong acids		22.93
Silica and silicates insoluble in acids		61.20
Carbonic acid (and loss on ignition)		16.49
		100.60

This rock is said to be situated about two-and-a-half miles from Williamantic, and to occur in layers that in the aggregate amount to three feet in thickness. It burns and slakes like common limestone. It contains, in round numbers, 40 per cent. of carbonates of lime and magnesia.

The sample analyzed was from a loose fragment believed by Mr. Bill to be identical with the rock of the ledge.

Very probably the impure lime obtained by burning this rock may be of great advantage if skillfully employed upon the contiguous farms.

G. W. DICKINSON'S BONE MANURES.

657. Ivory dust.

658. Bone turning chips.

666. Pure bone sawdust.

The above are from the manufactory of George W. Dickinson, of Essex, Ct. 657 and 658 were sampled by T. S. Gold, from material purchased of Charles A. Sill, of Saybrook, agent. 666 was sampled by the manufacturer and received through Mr. Gold.

MECHANICAL ANALYSIS.

	657	658	666
Fine, smaller than 1-50 inch, per cent	52	23	95
Fine medium, smaller than 1-25 inch, per cent	21	29	5
Medium, smaller than 1-12 inch, per cent	18	27	..
Coarse medium, smaller than 1-6 inch, per cent	9	13	..
Coarse, larger than 1-6 inch, per cent	.	3	..
	100	100	100

CHEMICAL ANALYSIS.

	657	658	666
Nitrogen	3.38	3.73	2.15
Phosphoric acid	26.86	25.97	19.20
Estimated value	$39.54	$37.88	$29.41
Selling price at Saybrook in bulk	$35.00	$30.00	$20.00

661. Soluble Pacific Guano, manufactured by the Pacific Guano Co., Boston, Mass. Sold by H. A. Stillman & Co., Hartford. Sampled August 30 by Dr. E. H. Jenkins.

The Station is informed by the manufacturers that the sample of Soluble Pacific Guano, 565, reported in Bulletin 58, April 28, was from a small quantity remaining over from last Fall in the hands of the dealers, H. A. Stillman & Co., Hartford, and does not represent the article in market during 1881. Its price, the manufacturers inform us, should have been $42 per ton and not $45.

At the manufacturers' request, sample 661 has been taken for analysis. The results are here compared with those obtained on 565.

	661	565
Nitrogen of nitrates	.62	none
Nitrogen of organic matter	1.74	2.61
Soluble phosphoric acid	7.29	5.90
Reverted " "	1.52	1.36
Insoluble " "	3.42	4.05
Potash	1.76	2.28
Chlorine	1.76	2.45
Estimated value	$36.83	$35.36
Price at Hartford	$45.00	$45.00

MAPES F. AND P. G. CO.'S FERTILIZERS.

662. Pure fine bone dissolved in sulphuric acid.

663. Bone superphosphate.

664. Leopoldshall Kainite.

665. Mapes Tobacco Manure, Conn. brand.

The above samples, manufactured by the Mapes Formula and Peruvian Guano Company, were sampled by Dr. Jenkins at the Company's Hartford Branch, August 30.

	662	663	664	665

ASK FOR

Wells, Richardson & Co's **PERFECTED BUTTER COLOR**

It Gives Butter the gilt-edged color the year round. The largest Butter Buyers recommend its use. Thousands of Dairymen say IT IS PERFECT. Used by all the best Creameries. Awarded the International Diploma at N. Y. Dairy Fair. Ask your druggist or merchant for it; or write to ask what it is, what it costs, who uses it, where to get it. WELLS, RICHARDSON & CO., Proprietors, Burlington, Vt.

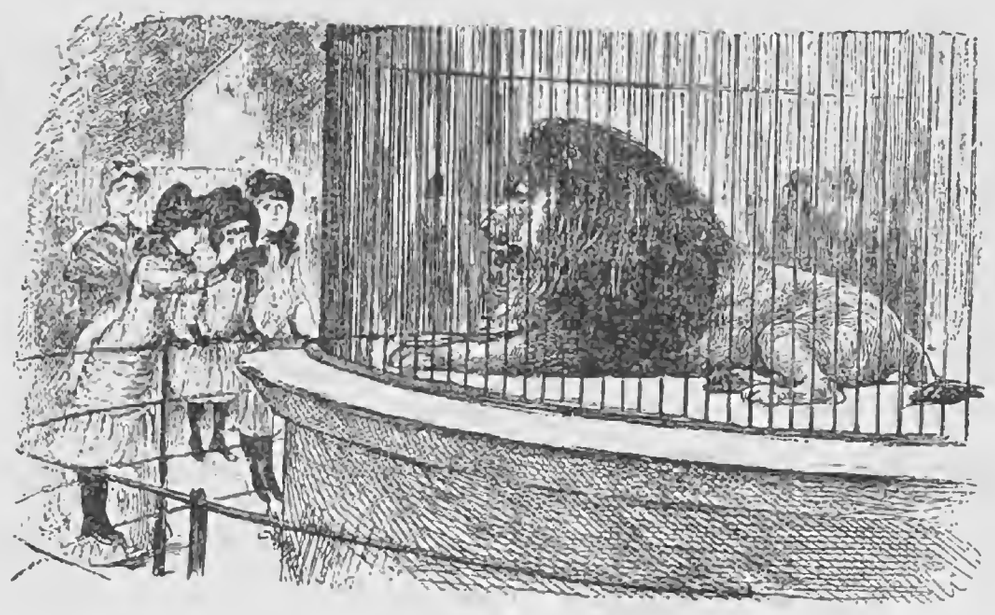
USE ONLY THIS THE FIRST AND THE BEST

Humorous.

JONES complained of a bad smell about the post-office, and asked Brown what it could be. Brown didn't know, but suggested that it might be the dead letters.

"PA," quoth Sammie to his sire, "why don't you go out West?" "Why do you ask, my boy?" Because Bill Higgins' father went, and he struck a banana?" "A bonanza, you mean, Sammie!" "Well, what's the difference?" "Why, when people strike a bonanza it sets them up, and when they strike a banana it sets them down—and very emphatically, too."—Yonkers Gazette.

AT a recent examination in a girls' school the question was put to a class of little ones: "Who makes the laws of our Government?" "Congress," was the ready reply. "How is Congress divided?" was the next question. A little girl in the class raised her hand "Well," said the examiner, "Miss Sallie, what do you say the answer is?" Instantly, with an air of confidence as well as triumph; the answer came; "Civilized, half civilized, and savage."



TENDER CONSIDERATION.

"Oh, don't make faces at him, Effie! It might frighten him, you know!"

Special Offer.

TEN POUNDS of our NEW CROP OF TEAS, Black, Green or Mixed, sent by express, charges paid, on receipt of $6.00.

OUR ANIMAL PORTRAITS.

Polled Suffolk Cow, Handsome 5th.

WITHIN the last few years polled cattle have been gaining rapidly in public favor in this country. Apart from their other merits, the absence of horns is greatly in their favor. The possession of dangerous weapons begets, in man or beast, a strong tendency to make a hurtful use of them, fostering a quarrelsome disposition, ever ready to take or give offense. Deprived of this incitement to contention, the polled breeds of cattle are all of a quiet, peaceable disposition. Having no weapons to fight with, they have no temptation to do so. They live in peace with each other and with other animals in the same yards or pastures. None of the numerous injuries and fatalities among companions and attendants due to the vicious, reckless or accidental misuse of their horns by other breeds can ever be charged against polled cattle. They occupy less room in the stable, the railroad car and at the feeding trough. Their quiet nature promotes rapid fattening; their gentle disposition makes them favorites with the most timid.

There are four British breeds of polled cattle—the Galloway and Angus or Aberdeen in Scotland and the Norfolk and Suffolk in England. Youatt, writing in 1834, describes the Norfolk and Suffolk as quite distinct breeds, giving preference to the latter both for beef and milk-producing capacity. Both, he thinks, undoubtedly sprang from Scotch Galloways, droves of which had from a very early period been prepared for the London market on the pastures of the adjacent counties of Norfolk and Suffolk. These were crossed on the native red, Devon-like cows of Norfolk, and on the dun-colored, deep-milking cows of Suffolk, and the progeny became so much more numerous and profitable than the old sorts, that they have come to be regarded as the native breeds which they have superseded. What difference still exists between the cattle of these two counties, is very much less marked than it was half a century ago, and in describing them at fairs and speaking of their characteristics they are now-a-days clubbed together as Norfolk and Suffolk Red Polled cattle. The Suffolk, however, is somewhat lower in stature, and finer than the Norfolk, besides being shorter in the leg, broader and rounder, and possessed of a greater propensity to fatten and attain heavier weight. Among hornless cattle they hold a position somewhat analagous to that occupied in England by the Short-horns among horned beasts—they are prized alike for their merits as dairy and beef animals. While, however, the Short-horns are favorites in nearly all parts of the country, the popularity of the Norfolk and Suffolk cattle is confined almost entirely to the counties from which they take their name. Of late the breeders of Red Polled cattle have been bringing them more than usual to public attention by publishing a Herd Book of the breed and making larger and more carefully selected exhibits of them at various agricultural shows, especially at those held within the two counties. The first volume of the Herd Book was published in 1874, and the first part of Vol. II. has just been issued. Together, they contain the pedigrees of 611 bulls and 1,966 cows. Special attention is bestowed on keeping a record of the various tribes included in the breed. At the Norfolk Agricultural Show held last June at Norwich, there were 62 entries of the breed, which won high encomiums from all lovers of fine cattle who beheld them, and at all the late fairs held in that part of the island they won a fine reputation.

Youatt says the Suffolk cow could be easily fattened to 500 or 600 pounds; now-a-days that would be considered a very light weight, as cows of the present breed run from 900 to 1,600 pounds. A medium-sized cow, from 1,000 to 1,200 pounds, is found, however, to be the best for both beef and milk, for any increase of weight above that is apt to be gained at the expense of the milking qualities. Probably the most economical plan would be to keep two strains, one of medium size for milk, and the other of larger size for beef, or the choice between the two might be determined by the object the owner might have in view—beef or milk. For the former the Red Polled is claimed to be as excellent a beast as the more famous Angus, maturing early and laying on rapidly and economically an excellent quality of meat, most abundant in the choicest parts and finely marbled with a desirable admixture of fat and lean. At the late Norfolk show two calves, a bull and a heifer, under 12 months, won first prizes; and of them the Agricultural Gazette said:—"We never saw, of any breed, calves of like age so extraordinarily developed; they were finished like two-year-olds. For milk the red polled breeds have always had a higher reputation than the black polled, both for quantity and quality. At the Suffolk show in England on June 30 last, a special prize for the cow giving the largest mess of milk was awarded to the Red Polled cow Wild Rose, which gave 13 quarts in 12 hours—less than she was accustomed to yield on the farm. The Red Polled cow Battersea 4th is certified to have made over 20 pounds of butter per week in the season.

The points of a superior animal of this breed are:—"Color, a deep red, with udder of the same color, but the tip of the tail may be white; nose dark and cloudy. Form, a neat head and throat and a full eye; a tuft or crest of hair should hang over the forehead. The frontal bones should begin to contract a little above the eyes and should terminate in a comparatively narrow prominence at the summit of the head. In all other particulars the commonly accepted points of a superior animal are to be taken as applying to the Norfolk and Suffolk Polled cattle." The accompanying likeness of Handsome 5th represents a fine specimen of cows of this breed, both as a beef and milk producer. She is owned by G. F. Taber, Patterson, Putnam County, N. Y., the largest importer of Red Polled cattle, and was bred by R. E. Lofft, Bury St. Edmunds, England, one of the most extensive breeders of these cattle in the Kingdom, and a frequent winner of prizes at the various agricultural shows at which they are exhibited. Before leaving England Handsome 5th had handsomely added another to his long list of premiums. She was also one of the herd that carried off all the premiums in that class at the New York State Fair, at Elmira, last September.

POLLED SUFFOLK COW, HANDSOME 5TH.—FIG. 506.

JERSEY COW PRIDE OF EASTWOOD (10,297).

THOSE who have read the excellent reports of the Western fairs that have been appearing in our columns, will have noticed the frequent triumphs of the Eastwood Jersey Herd owned by Messrs. Hoover & Co., Columbus, Ohio. Of this fine herd the glory is the cow Pride of Eastwood, an excellent likeness of which we present to our readers at Fig. 510. She has a record of 21 pounds 13 ounces of unsalted butter made in seven days, when four years old, 90 days after calving, which, her owners claim, exceeds any record within their remembrance. During her career at the fairs this Fall she has won, or helped to win, the following prizes:—First prize in the four-year-old class at Minneapolis, Minn. At the same place she was also one of the herd that won the first Jersey herd prize and the second prize at the grand dairy herd competition for $1,000. At the great Chicago Fair, in a class of 23, she carried off the sweepstakes prize as the best dairy cow of any breed or age. She was also one of the first-prize Jersey herd which also bore away the grand dairy prize of $500 and a gold medal valued at $100. At the Illinois State Fair, at Peoria, she again came up a first-prize winner, and shortly afterwards she added to her honors at the great St. Louis Fair by taking the first prize in the four-year-old class and the sweepstakes for cows of any age, besides being one af the first-prize dairy herd. A glance at her splendid udder and fine form will remove all surprise at her triumphant progress.

Dairy Husbandry.

THE DAIRY COW.

HENRY STEWART.

Garget (Mammitis).

GARGET is the common name given to diseases of the udder. The technical name, mammitis, or inflammation of the mammæ or milk glands, includes a number of affections of this organ; garget, ropy milk, bloody milk, diseased or impure milk and whatever may cause disorder of the milk secretions.

A description of the construction of the udder, or rather the mammary glands, of which the cow has four inclosed in one common envelope, all of which we call the udder, will explain more clearly the nature and effect of the various disorders which are commonly included in the term garget. At figure 507 is a representation of a supposed section of the udder made lengthwise through it, from front to rear. At A. is the milk vein so called, but really the abdominal subcutaneous vein, which in cows has an enormous volume. The capillary or ultimate branches of this vein are very numerous, and connect and anastomose, or form a continuous net-work, with the capillary or ultimate branches of the sub-cutaneous abdominal artery, which supplies the mammæ with blood. These capillaries surround and envelop the gland vesicles, shown at figure B. These gland vesicles here figured, appear as magnified four times. Each one of these minute vesicles has the office or function of secreting the milk from the blood supplied to it by the arteries, and the blood which has parted with its quota of milk, then passes to its veins on its way to the lungs and heart for purification and a fresh supply of nutriment from the great thoracic vein which pours into the heart the blood newly formed from the digested food. Thus the milk is as direct a product of the blood as are the muscular tissue and fat, which are deposited in their proper places from the proper vessels of supply. These gland vesicles are clustered in groups around

the lactiferous, or milk-conveying, ducts. much as a bunch of grapes is clustered around the stem upon which they hang from the vine-stalk. They are about 1-200ths of an inch in diameter. Each vesicle contains a number of cells and each cell has a nucleus or central mass; this is shown at fig-

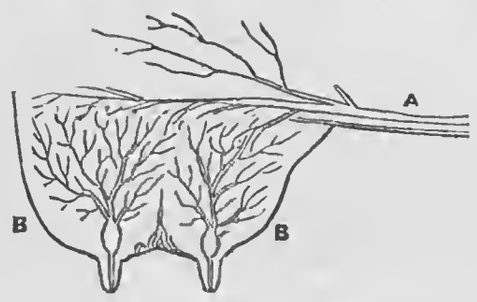

FIG. 507.

ure 509; in which the gland vesicles are highly magnified. These gland cells become infiltrated with fat during the period of milk production and this fat supplies the cream of the milk. The milk ducts converge and run into two, three, and sometimes four large channels which in their turn empty into a larger reservoir situated at the base of the teat (see Fig 507 at B.) These milk ducts are lined with a fine mucous membrane and this itself secretes some portion of the milk which always contains more or less mucus. The teat is formed of, first, this fine mucous membrane, which is very delicate and sensitive, then a thick layer of tissue over which the mucous membrane is doubled; and this tissue is again covered by the skin.

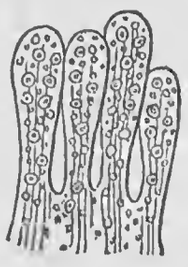

FIG. 508.

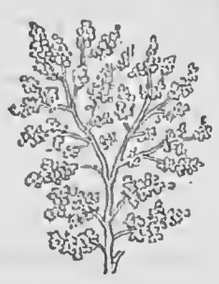

FIG. 509.

Among this tissue are numerous bundles (fasciculi) of muscular fiber, arranged in a circular and a longitudinal manner around the duct or orifice of the teat. At the base of the teat is the sphincter muscle, which operates as an elastic band or ring to close the duct; below this are several other bands of concentric muscular fiber, and around the duct, lengthwise of the teat, are arranged numerous other fibers. A coarse representation of this

FIG. 510.

arrangement is given at figure 510. These muscular fibers, as well as the whole of the structure of the glands, are abundantly supplied with nerves. The whole of the glands is completed in structure by connective tissue which forms the mass of the udder, and this is surrounded and supported by several wide, elastic bands, and held in its place by the skin which covers them.

From this description of the milk glands of the cow and the secretory apparatus can be readily understood its delicate and sensitive character. The large supply of blood which passes through it from the important artery which supplies the whole reproductive apparatus, renders it remarkably sensitive to any disturbances of the circulation, or any accidental local derangement. Inflammation arising from an excessive circulation and supply of blood is accompanied with engorgement of the fine vessels, and blood may pass directly through the secretory glands into the ducts and become mingled with the milk. This explains the phenomenon of bloody milk, or the sensitive mucous membrane abundantly supplied with blood in minute circulating vessels, when in a condition of inflammation from whatever cause, secretes an excessive quantity of mucus, and hence we may have ropy milk, which is milk so largely mixed with mucus as to become adherent and stringy. Or when this ropy, adherent, glutinous mass fills the ducts and no milk can flow through them, the whole secretory function is arrested; the udder becomes hard; the gathered matter is absorbed into the connective tissue, and we have a development of garget or inflamed udder in its worst form.

Unless speedily relieved, the fine secretory cells become obliterated in a growth of hardened tissue, and the gland so far as this may occur, loses permanently its power of producing milk; and we find sometimes one of the glands, that is, a quarter of the udder, with its teat, spoiled for future use and dried up permanently. In bad cases the continued inflammation produces pus which burrows through the tissue, destroying the glands, and finally appears at the surface as an abscess, by which the products, of the inflammation escape. But the damage to the secretory apparatus may have been beyond remedy, because the minute cells of the finer glandular structure have been destroyed. The structure of the teat explains why the cow is able to retain the milk or let it down as is done in the operation of milking. The whole muscular part of the udder is under the control of a system of voluntary nerves. The cow can draw tight the sphincter muscle which closes the outlet of the main lactiferous reservoir at the base of the teat. She can contract the muscular bands which support the whole udder, and so compress the whole arrangement of the ducts as to prevent the flow of milk. Or, when by reason of weakness of the sphincter muscle or by the will of the cow, it is loosened, when the weight of the loaded udder may become irksome to her, the passage is opened for the escape of the milk, the milk is leaked away and lost. Sometimes, again, the fine membrane lining the teat is injured and tumors or lumps are produced and the duct is obstructed, the cause may be easily understood. Or when the skin at the outer orifice of the teat scales off, as it is apt to do, and the milk spatters and spreads instead of flowing with an even stream, we may recognize the cause of the trouble from knowing the precise method in which the teat is constructed. The whole udder is a most wonderful organ, and the dairyman, or the owner of a cow, recognizing this fact, will do well to exercise the greatest care in every way to protect so sensitive and delicate a structure from every chance of injury.

A NEW FIELD FOR A GREAT INDUSTRY.

Cheese Dairying in the Southwest.

SOME years ago, I became satisfied that certain parts of the Southwest possessed great advantages for the manufacture of cheese; but I had been pushing new things with such pertinacity and frequency upon the people with whose interests I have been most completely identified, that I have kept back the business which will be the topic of this article. Lately in a tour through the West I became more than ever impressed with the advantages for cheese-making which the grass belt of East Mississippi and Western Alabama possesses. Determined to see if there was any "weak spot" in the deductions I had made in regard to the matter, I visited Little Falls, Herkimer Co., New York, and made a tour among the cheese-makers there, visiting several of the largest manufactories, and talking with the practical men whom I met. I was overjoyed to discover that not only were my views corroborated; but the cheese-makers in one or two instances gave me some points to show the advantages of the above-named country over the North and West, that had not suggested themselves to me.

"Cheese-making in Mississippi! Why, I never thought of such a thing," was the first exclamation of almost everyone, when I inquired what was thought of making cheese there: then I would draw out my note-book and give a synopsis of my points; and I soon had a convert. I did not find a single dissentient voice among all the cheese-makers I talked with; but the subject was new and no one had thought about it, except here and there an occasional one "wondered" why cheese could not be made profitably in the South. I will give briefly my points just as I submitted them to the cheese-makers;

First. In East Mississippi a cheese factory can be run the year round, because pastures are to be had the year through, in clover, Blue-Grass, etc., for eight to ten months in the year, and Bermuda Grass, Japan Clover, etc., all Summer. At the West—in Michigan, for instance—factories are idle from about Nov. 1 to May. In New York, the matter is a little better; but at the best, the capital involved in a factory and the men working in it are idle from one-half to one-third of the year. Is it necessary to say anything on the advantages of being able to make cheese all the year instead of only for six or eight months?

Second. In the Southwest there is no competition, and there is a home market. If there is a cheese manufactory in the Southwest, I don't know of it; I don't believe there is one south of the Ohio River. I think I may safely assert that there is not one in the States of Alabama, Mississippi, or Louisiana. The cost of transportation and the charges of many middle-men are saved. The merchants would order direct; and advertising, commissions, etc., would be saved. A stock would never have to be carried any time, because there would be no competition, nor would it have to be sold at a sacrifice because the owner could not afford to carry it.

Third. A higher quality of cheese could be made because the milk would be grass-flavored the year round. This would produce an evenness of quality, which would give a cheese-maker a reputation and a better price for his product, as well as a readier sale.

Fourth. There would be a more even supply of milk, thus giving an opportunity for a larger product of cheese. At the North and West, as is well known, by August or earlier, the supply of milk falls off about one-third, owing to failing pastures, and soiling with green corn and other devices has to be resorted to, to even maintain that; in the South, Bermuda *never* fails, except by reason of cold weather, and in its season it is superior even to Blue Grass. Besides Bermuda, the South can have Johnson Grass—claimed by some to even surpass Bermuda, Japan Clover and others. Moreover, in the North and West hot weather and flies affect the yield of milk very much, and, strange as it may seem, these do not sensibly affect cattle in the prairie region of Mississippi, it being well known that a cow can be milked there any time of the day; the molestation from flies, mosquitoes and gnats being incomparably less there than at the North and West. Then again, few or no cheeses would be lost by skippers; fresh meats receive little injury from "fly-blowing" there.

Fifth. In the country in question the cost of fuel to keep milk at the proper temperature would be less than at the North and West, for it is cheaper. Of course, this applies only to the seasons of early Spring late Fall and Winter.

Sixth. Building material is somewhat cheaper in Mississippi; this, although not much, is something; and not to be unmentioned in any attempt at a thorough exposition of the advantages of the South.

Seventh. A great advantage lies in the fact that the immensely fertile prairie lands of East Mississippi can be bought at from $5 to $15 per acre. There are no finer grass lands on the continent. Land once in grass, is in grass there for a life-time. Clover needs no re-seeding. The pastures are green the year round. North and West lands are worth (I mean in the choice cheese-making regions) from $50 to $150 per acre, and cows must be fed during Winter, at considerable cost. Is it necessary to elaborate this vast advantage?

Eighth. The evenness of temperature in Summer facilitates the "curing" of the cheeses. From May to November in the South, the heat is even enough to let the curing process proceed uninterruptedly and without artifical heat, thus enabling parties to promptly "realize" on their product. North and West the variation of temperature at times hinders "curing."

Ninth. Another very considerable item is, that "scrub," or common cows, can be bought at $10 to $15 each. These, crossed by Jersey or Ayrshire bulls, will give very superior milch cows; and make the cost of fine milch-cows less than at the North and West. The skim-milk cheeses made from these grades would be superior to that grade of cheese made from the product of Northern stock. The day is coming, when cream cheeses, made from the grade Jerseys and Ayrshires at the South, are going to lead the market.

All along, perhaps the reader is wondering how we are going to cool off our milk to the proper temperature. No trouble at all. In the first place, our nights are invariably cool—a great help. In the next place, we can get cool water from our springs, or from artesian wells 500 or more feet deep, or we can get an even temperature of 62 degrees in our sub-earth dairies in the rotten limestone rock. Readers may find something new in these thoughts; but the South is seeking and welcoming new things. Thousands of acres are being seeded to the grasses. We are beginning to make hay and raise cattle and sheep. We are beginning to raise our own pork. We are introducing peppermint from which to distil oil. We are going into silk-raising. We can raise three crops of cocoons per annum. We will soon be raising jute for our cotton, bagging, etc., and have a manufactory in New Orleans. We are beginning to raise the castor bean. Our cotton manufactories and woolen mills are rapidly increasing. We shall soon be making our own shoes, harness, and leather. Our coal and iron mines are being rapidly developed. In fine, we are on the "high road" to rapid, substantial, enduring progress and development.

Veterinary.

TREATMENT OF PUERPERAL FEVER IN A COW.

I HAVE read Mr. Stewart's articles on "The Dairy Cow," with much interest, and especially the article on "Care of Cows in Calving," published some weeks since, and, although it may appear like egotism for me to attempt to add anything to what he has written on the subject, I have thought perhaps an experience I recently had, in a case of an attack of puerperal, or milk fever, and the result of a course of treatment entirely different from that recommended by him, might interest readers of the RURAL.

I have a very choice cow that did not come in until about the last of June. I think perhaps there would have been no trouble with her, were it not that the morning on which she calved it was cool and rainy and she became thoroughly soaked. After dropping her calf I put her in the stable, and as I always do in such cases, fastened her in the stanchions, to prevent her from eating the afterbirth. Right here I think is where I made my mistake. Had I rubbed her thoroughly until she had become warm and dry, I doubt whether any ill effects would have followed; but from being wet and then confined so that she had no chance for any exercise, although she ate readily of some feed I gave her; yet after standing in the stable for four or five hours she was taken with a violent chill, and suddenly became so weak that it was with difficulty we could get her on her legs after loosening her from the stanchions.

I began the treatment by rubbing her smartly, and especially her limbs which seemed very cold. This I continued for about an hour, after which we drenched her with two heaping tablespoonfuls of cayenne pepper in about a pint of sweet milk.

This was recommended by a neighbor of mine, a man who has had many years' experience in the care of cows, and keeps a dairy of 40 cows or thereabouts. He claims that in all his experience he has never found anything that had so good an effect in such cases as the free use of cayenne pepper.

Be that as it may, the effect was all that could be desired in this case, the cow becoming naturally warm after a little time, and although she was very weak for a day or two, and, as a natural result of so great a shock of the system, the flow of milk was much decreased for a few days from what it would otherwise have been, she has since the first few days after calving given her ordinary mess of milk as compared with previous years.

Since I began writing the above communication an incident has occurred illustrating how prone we are to believe *our way* the only correct way, or, even if the same or equally good results are reached by some other means, to still consider that ours is *the best way*. The incident, which I think worth relating, is this. An uncle of mine was visiting me, and I told him about the case of this cow, and my treatment of her, and its result. He admitted that he thought I was very fortunate in saving her, "But", said he, "I think it would have been better if you had used saltpeter, instead of cayenne pepper," and he proceeded to give the result of his treatment of a case by the use of that remedy.

Farm Topics.

THE TRUTH ABOUT IT.

THE object of articles under this heading is not so much to deal with "humbugs" as with the many unconscious errors that creep into the methods of daily country routine life.—EDS.]

MORE ABOUT ENSILAGE.

HENRY STEWART.

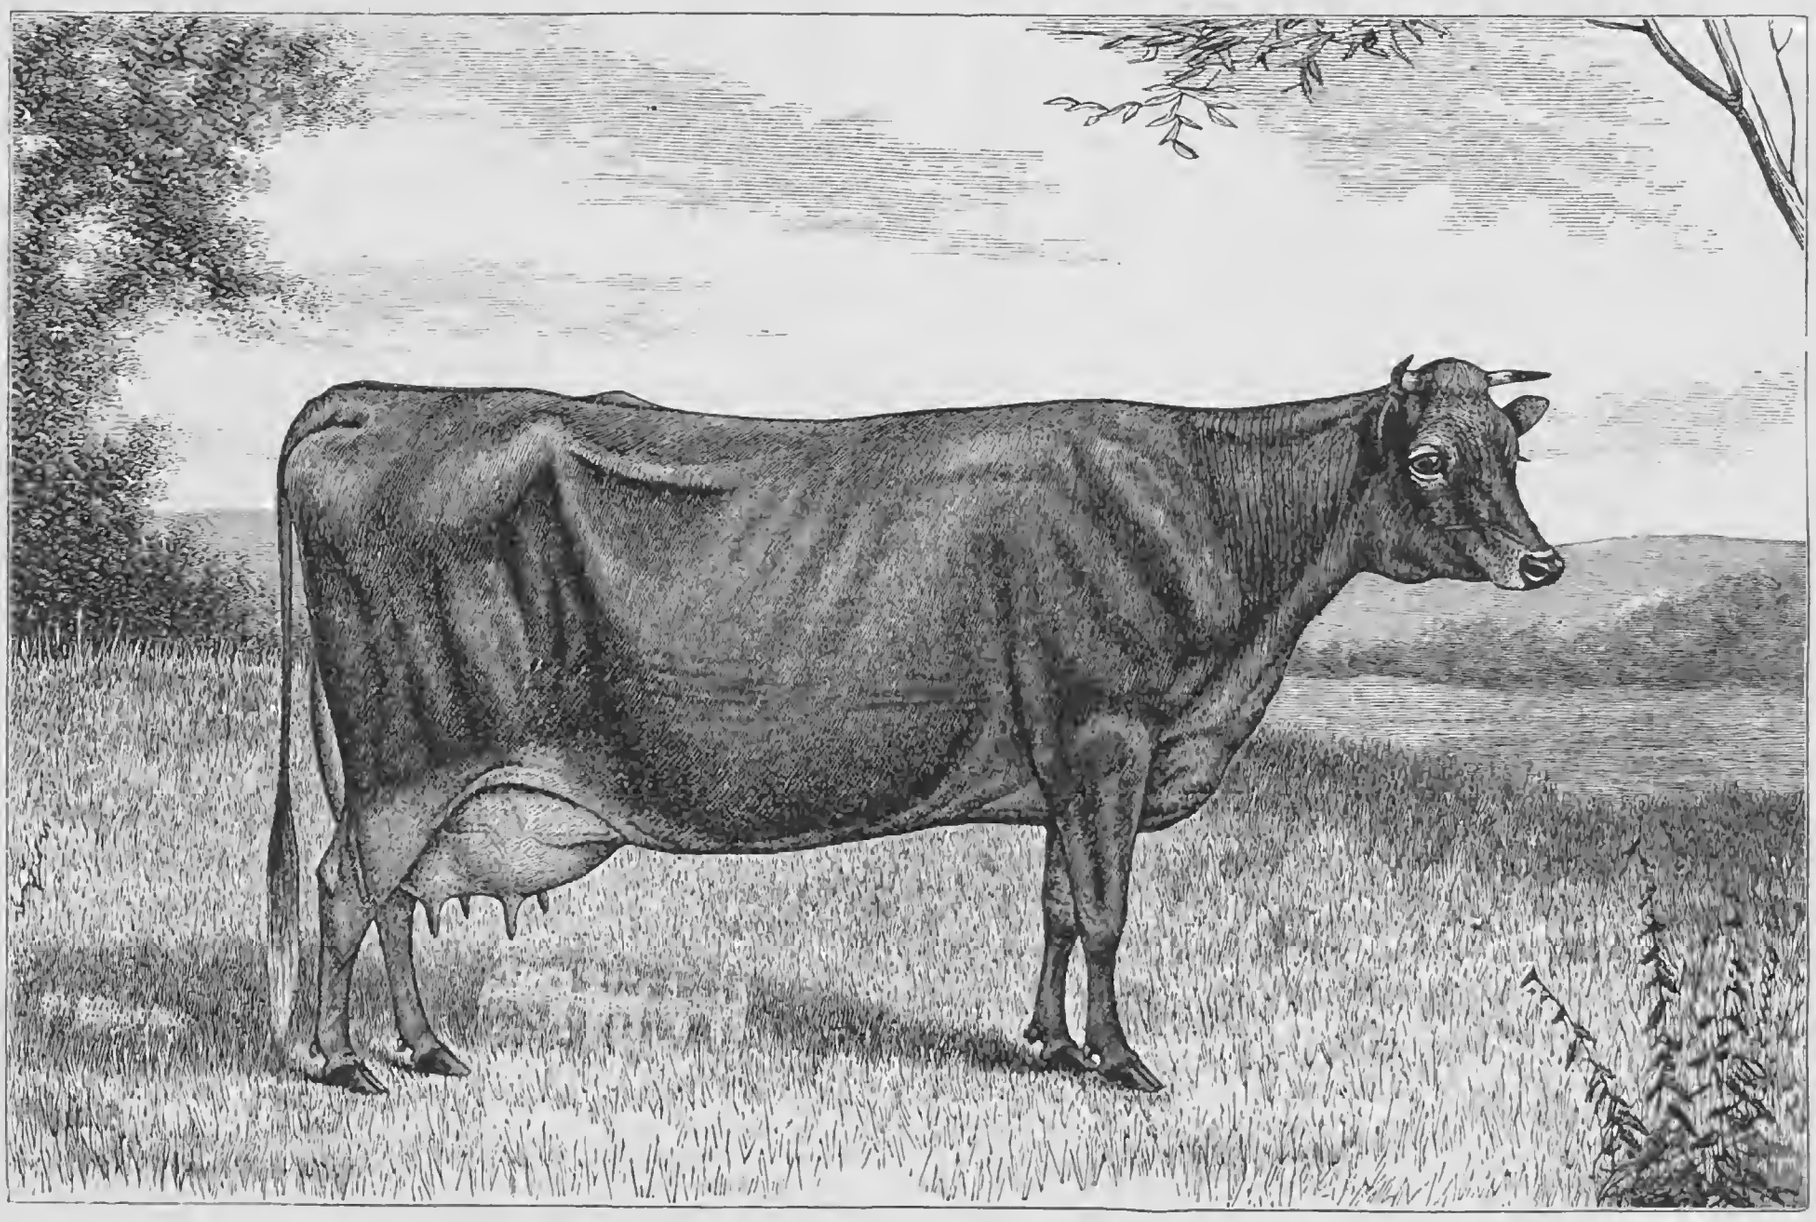
Now that Dr. Bailey has subsided, his dropped mantle has been taken up by Mr. Mills, or I might say that Dr. Bailey has passed over his hat to Mr Mills as a token that the latter gentleman has far outdone him in his stories about ensilage. A statement is going the rounds of the papers which is calculated to strike the populace with wonder and give them an idea that farming under "the new dispensation," as the disciples of the Bailey school of ensilage term it, is a more rapid road to wealth than any other known speculation. The statement is to the effect that Mr. Mills fed last year, from 10 acres of corn fodder, 140 animals, cows and horses, for seven months. The past Summer he has fed 100 cattle, mostly milch cows, for six weeks, on five acres of oats. Further, he believes that he can keep 150 cattle from now until the corn crop of 1882 is ready, that is eleven months, on the corn fodder cut from 25 acres. All this is copied verbatim from a prominent newspaper which has a wide circulation, and is copied from some other source not acknowledged.

Now let us figure up a little upon what Mr. Mills has done, leaving what he believes he can do out of the question. One hundred and forty head of cattle fed seven months are equal to one head for 980 months; this being from 10 acres it is equivalent to one head fed 98 months, or 2,940 days, from one acre: 2,940 days' feeding at 80 pounds per day is equal to 235,200 pounds, or 117 tons 1,200 pounds as the yield from one acre. This is pretty good for a corn crop and in an excessively dry season, too; and we may wait with wonder for the next man's story. But this king plant, corn, is "called up" by the oats, which for oats "goes him" at least "one better" quite recklessly. One hundred cattle fed for six weeks, or 42 days, are equal to one fed for 4,200 days. This from five acres is equal to 840 days from one acre of oats; 840 days at 80 pounds per day are equal to 67,200 pounds, or 33 tons 1,200 pounds of oats per acre. What other oats can hold up their heads to these oats? These should be the true "Ennobled" oats! Now, I should be sorry to doubt the *facts* above

given, although the figures do push them pretty hard.

I have claimed to have done something in growing corn myself, and some persons have in a sort of high moral way repudiated in the coldest and most unsympathizing manner the intimation that they were the authors of a statement (made by me) that it was easy to grow 100 bushels of corn per acre. But as *I have* done it; and the editor of the RURAL NEW-YORKER has done it; and a whole lot of farmers' boys have done it, it must be a very modest man who will say that it cannot easily be done. But let that pass. What will those gentlemen — my friend E. W. S. and Prof. Roberts—say about this corn crop of 117 tons 1,200 pounds per acre grown by Mr. Mills? It must, of course, have been grown, because he fed it, and cattle cannot fill their bellies on stories, however big and inflated they may be. A plain farmer may realize what this crop amounts to when we figure up that it is three - quarters of a ton, nearly, from a square rod of 252¼ square feet, or 16½ feet square; that is, six pounds to each square foot. But Mr. Mills, of course, has that attribute which was possessed by the Father of his Country when he was a little boy and amused himself with his little hatchet among the cherry trees, and so we must believe this story, unless a wicked printer has put a wrong figure in it.

Now the truth about this ensilage business is told by Mr. Lawes so far as regards the value of the fodder. As regards the yield, every farmer can easily judge for himself; the real value of the process is in preserving the fodder in a succulent condition without losing any of the value of it in drying. Grass is better than hay, green oats and corn are better than dried straw or fodder. Why it should be so, when in drying only the water is lost, it is difficult to say. But we know it is so. Then if we can preserve the green fodder in its fresh condition, even with a loss of some of its nutritive value, we gain a good deal. The process is of such certain value that persons should not be led into disparaging it by these big stories. No truth is shamed by the persons who bring it into discredit by exaggeration and vainglorious boasting of what they have done or expect to do. I believe the process will turn out to be the very thing required to make soiling cattle fully effective, the whole year round; and if so, the key to cheap feeding and rich fertilizing of the soil has been found.



JERSEY COW, PRIDE OF EASTWOOD, (10,299.)—SEE PAGE 745—FIG. 511.

VARIOUS TOPICS.

B. F. JOHNSON.

PERHAPS there is no more striking instance of how readily agricultural implement makers and inventors consult the wants and wishes of farmers in respect to new tools and the improvement of old ones, than the suddenness with which all the self-binding harvester manufacturers threw away their wire attachments and adopted those using twine. I have sometimes thought inventors were, after all, the first and foremost in improved farm practice, for as soon as, and sometimes before, the need of new tools and implements has been made manifest to a very few only, the inventors had them ready at hand. When, in consequence of several wet seasons in succession, many fields grew up to have a sward of weeds and coarse grasses no common single plow could master, the sulky or riding plow, capable of almost any work, came to the rescue; and when the wheat acreage increased beyond the power of the farm and surplus labor of the country to harvest it, the self-binder appeared on the scene. Having witnessed all this, I am prepared for the cotton picker and the corn shucker, and almost any other imagined implement there is a loud call for.

REFERRING to the wheat crop of the East, which in many places has suffered very much from continued heat and drought, as that of the Mississippi Valley did from the same causes this time last year, it is gratifying to be able to report that the continued, and, part of the time, copious rains since the 27th of September have brought the crop forward in a most gratifying and surprising way. Perhaps late seeding has been interfered with and in some cases prevented, for it is rare that for this latitude (40 degrees) and time (October 14) wheat sown after, makes a paying crop. But perhaps the most gratifying circumstance to be mentioned at this time is the probable considerable, if not general, destruction of the chinch bugs, which were so incredibly numerous a few weeks ago that they thickened the air, resembling a thin cloud of smoke for three or four warm afternoons. If the present multitudes of chinch bugs disappear all of a sudden, and from what appears to be insufficient causes, it will be repeating nothing more than the experience of the past on several occasions —whereat we shall heartily rejoice.

BUT if the last week in October or the first week in November is two or three weeks too late to sow wheat in the middle latitudes, it is not too late to sow rye, and therefore where land has been prepared for wheat and the copious rains have prevented the use of the drill, rye can be substituted for wheat with reasonable certainty of a good crop, when sown as late as the last of November. Late in the month of March, 1881, I had the opportunity to see many thousand acres of wheat, the very feeble condition of which prefigured the failure of the crop at harvest; but in every case where I encountered rye my eyes were relieved and refreshed with a mass of living green. To be sure, last Fall was a cold and dry one and the Winter very severe, and the present Autumn so far, for the West, has been warm and wet, but rye is so hardy a cereal it is reasonable to suppose its ability to make a crop where wheat fails will insure the same thing under conditions favorable to wheat.

THERE is a constant loud call from the South for varieties of what are called rust-proof wheat and oats. That there should be a demand for them is reasonable enough; but it is not so that it should be made on the North. The Southern States belong to the category of warm and dry, if not hot, climates, and the cereals suited to those sections should be from climates of a similar character; say the countries lying along the south shores of the Mediterranean Sea in Northern Africa—Morocco, Algiers, Tunis and Tripoli. The cereals, in common with all plants, live and develop under a certain range of temperature, flourishing best at a certain mean. When this is exceeded on the one side or the other, growth is arrested, fungus in some form appears, and the plants die. This is what happens where cereals, differentiated to moderate temperatures, are exposed to the intense heat of the South: the growth of the plant is arrested, and rust or fungus steps in, and the result is as we see.

IF the Chief of the Department of Agriculture, in looking about for seeds for distribution, would keep in mind the needs of the South for varieties of wheat, oats, barley and rye, and, I may add, Indian corn, suited to the peculiar soils and hot Summer seasons, and consult the characteristics of the cereal crops of the countries named above, it is probable some very valuable new varieties might be obtained. Many of the wheats of Northern Africa are remarkably hard, flinty and nitrogenous; others soft and starchy, while all, or nearly all, are so tender they will submit to nothing like severe frosts. Then there are the cereals of the high table lands of Mexico and Central America. Doubtless among those might be found many which would be found to be rust-proof in the South, that is, so well endured to a hot climate, that the process of growth would go on under a sustained high temperature.

IT has been generally supposed that Indian corn was so much of a tropical plant that Northern varieties, especially those large ones of the Mississippi Valley, would stand any reasonable amount of heat and drought both in the upper and lower cotton belts. But the experience of this year has corrected this notion, for it is found that in Louisiana the Creole (that is the native corn) has produced fair crops under conditions of heat and drought where corn, the product of Northern seed, has wholly failed. This admits of the reasonableness of the idea that there are varieties in existence capable of withstanding an unusual amount of drought and that at the same time will attain maturity under a comparatively low Summer temperature, while there are others, which, having acquired the tendency to make strong and large root growth, will yield good crops on comparatively poor soils.

PROFESSOR BLOUNT'S WORK AT THE COLORADO STATE COLLEGE.

THE interests of agriculture demand careful experimentation. Some men, either at their own or the State's expense, must give up farming for profit and devote their best time and talent to a work which shall produce its best results for coming generations. Such men deserve commendation, inasmuch as what they do is done not so much for self and self-interest as for the public and public interest.

It is hardly necessary to say to RURAL readers that Professor Blount, of Colorado, is one of the foremost experimenters of the day in agriculture, and the work he is doing for Colorado and the country in general should be gratefully recognized. With the necessary working facilities furnished by the State he is enabled to carry on a series of experiments as to methods, varieties, treatment of soil, etc., etc., which are greatly to his credit, and, yet more, to the advantage of the State in which he lives. His experiments in wheat culture have, perhaps, been the most interesting, as they probably are destined to be the most profitable to the farmers of the West. He has originated new varieties; has shown that in well-prepared land too much seed is sown to the acre; that Winter wheats will do well in Colorado, and that thorough cultivation is the great secret of success in farming. Professor Blount expects to perfect 15 new hybrids, or crosses, in wheat next year, and, together with the 124 varieties already produced, we may expect an interesting report another year. Any improvement in variety or cultivation of wheat is of great importance to the vast wheat-producing sections of the country. In his wheat experiments he has sown at the rate of 50, 40, 30, 20 and 15 pounds to the acre, and he concludes that 30 pounds to the acre, when the soil is well tilled, will produce as much grain as 90 pounds to the acre when the soil is poorly tilled. Here is an important item, and if it be true, as it doubtless is, that from a-half to three-quarters of a bushel are wasted, as he says, on every acre, estimating the total acreage to wheat at the low figure of 32,000,000 acres, in a single season 16,000,000 bushels, at the least calculation worth more than as many dollars, could be saved and devoted to a better purpose.

The potato blight has been claiming Mr. Blount's attention, and it is his opinion that the disease first develops itself in the form of a black spot at the base of the stalk and that the black line extends downward to the root and through the potato. He has, in all his investigations, found no insects, and believes they have nothing to do with the blight, but the cause is probably atmospherical. He thinks a remedy can easily be discovered, though the exact cause for the disease it may be difficult to determine. His investigations have been extended to almost every crop produced. He has grown flax, hemp, jute, and rice successfully, and even sweet potatoes have been made to produce well. Twenty-one varieties of tame grasses are under test, all sorts of forest trees are being cultivated, new varieties of fruits are being originated and tested; in short, he is doing a comprehensive and thorough work and the results thereof will tell.

Aside from the actual advantage which will accrue from his experiments, *per se*, his position as Professor of Experimental Agriculture and Mechanic Arts in the Colorado State College enables him to impart such instruction to his students as will encourage them to continue the work, and they will carry with them into their field of labor a practical knowledge of how to cultivate the soil, a lofty ambition to excel therein, and an ability to combine theory and practice in such proportions as to bring about the best results. Such is a bare outline of what Professor Blount is doing to exalt and ennoble and render more profitable the vocation of the farmer.

Field Crops.

RAISING FLAX.

THE beginning of flax culture in Kansas dates back to about the year 1870. Previous to that time the principal crop of small grain had been Fall wheat, but the yield of that cereal was so uncertain and the crop was attended with so many failures that its cultivation gradually ceased in this part of the State. The introduction of flax supplied the place of wheat and the success attending its cultivation soon led to a rapid increase in the area sown to it and it now occupies a prominent rank in our industries both in regard to a number of acres sown and remunerative returns for the labor expended.

The soil of our prairies is a rich, black

loam from one-and-a-half to three feet in depth. It contains a small percentage of sand which not only gives it warmth but accounts for its loose and mellow character and the ease with which it can be pulverized and prepared for crops. It appears to contain all the elements necessary to the successful growing of flax.

In selecting ground for this crop, that upon which corn was grown the previous year is in every respect suitable. The first step in preparing the ground is a thorough plowing. I then go over it with a harrow in order to level and pulverize the soil which is then ready for seeding. I have practiced both drilling and broadcast sowing and both methods have proved equally successful; but, as a general rule, I would recommend the use of the drill to all who are not experienced broadcast sowers. If the seeding has been done with a drill I then go over the ground with a heavy roller, which completes the process of pulverizing and packing the soil and leaves the ground smooth and level and in proper condition for reaping. If the seeding is done by broadcast sowing, it is then necessary to go over the ground with a harrow or brush to cover the seed: then finish up with the roller. The right time for seeding in this latitude seems to be the latter part of April and not later than the first week of May. The proper quantity of seed to sow per acre is about three pecks.

In harvesting the crop I use the Improved Buckeye Reaper, with the table self-rake, which throws the flax off on the ground in small bunches or gavels, in which condition it is left to dry or cure, which usually takes from four to six days: if the weather should be wet or unfavorable it will be necessary to turn the gavels over with a fork, or, what is better still, set the gavels on end in small bunches with the heads up (just as Buckwheat is set up) in which condition it will stand through repeated rains and then dry out without injury to the grain. The proper stage of ripeness when ready for reaping, is when the bolls assume a rusty-brown color, and it matters not if the leaves and stalks are still green then is the proper time to reap it.

When the gavels have become sufficiently dried out or cured, it is then ready either for thrashing immediately from the field, or for stacking to be afterwards thrashed at leisure. I have usually practiced the latter plan for the reason that to keep the machine running the former requires a strong force of men and teams, that is not always available. The latter plan requires but a small force to stack the grain, which can afterwards be thrashed out at one's convenience with a small force of "help." I usually let the grain remain in the stack from six to ten weeks before thrashing. The yield of straw after thrashing is usually from one-third to one-half ton per acre. This I carefully stack at the time of thrashing and feed it to my horses and cattle during the Winter. It makes a good substitute for hay; stock are very fond of it and eat it with a relish; and it apparently has all the nutritive qualities of the best of hay. The area of my flax crops has ranged from 40 to 65 acres; this year it amounted to 50 acres. The average yield per acre for all previous years has been from 11 to 12 bushels; but this year, in consequence of the prevailing drought, my crop only averaged six bushels per acre—barely half a crop, and I might remark that a half crop of all other kinds of grain as well as hay will be the result in Kansas this year.

I have usually marketed my crop of flax during the month of October. The average price has been about $1 per bushel; this year the present market price is $1.25. I have found flax culture one of the most profitable industries that I could engage in; and flax now occupies an important place among the agricultural products of this part of the country. The soil and climate here seem well adapted to its production; it is entirely exempt from the ravages of the chinch bugs that damage other crops more or less; its production is attended with less labor than that of any of the cereals and in the routine of crops it plays an important part. For instance, there is no better ground for flax than that on which corn has grown the previous year; the flax then leaves the ground clean and in fine condition either for wheat or rye or for oats or corn the following Spring, which makes a very desirable rotation for crops. LEROY SAXON.

Atchison Co., Kan.

A POTATO EXPERIMENT.

IRA. J. BLACKWELL.

IN the following statement I give the cost of raising one acre of potatoes, the size of the pieces, the yield of 16 different varieties, and the order in which they came to maturity. The land was cropped with corn last year. The potatoes were planted from April 12 to 16, all the work not having been done on one day:

The acre was manured with 550 pounds of Mapes Potato Manure, applied in furrow with potatoes, value	$14.57
1,000 lbs. potash salts, sown broadcast	9.00
7 loads barnyard manure, spread on land before plowing	10.0
Hauling manure and applying fertilizers	2.00
Planting, one day for teams and three men	5.00
11 bush. of potatoes for planting	14.45
May 23, ½ day cultivating, going twice to row	.50
" 28, plowing and cultivating, going four times to row	.75
6 days' hoeing, at $1.25 per day	7.50
June 1, 1½ lb. London-purple	.25
2 bush. plaster	.70
Applying plaster and purple, 1 day	1.25
" 14, ½ day cultivating	.50
" 20, ½ " "	.50
" 22, 1 " pulling weeds	1.25
1½ lb. London-purple and 3 bush. plaster	1.23
1 day applying	1.25
July 8, ½ lb. purple, 1 bush. plaster	.42
" 23, 2 men digging potatoes 1 day	2.50
team ½ day	1.00
" 25, 2 men and boy ½ day digging, and team	2.25
" 26, 2 men and boy and team ½ day digging	2.25
Aug. 4, 2 men ½ day and team ½ day digging	1.70
Total	$80.85

No rent is here charged for the land, as I calculate that the succeeding wheat crop will be benefited by the manure enough to pay the rent of the land.

Order of ripening.	Am't of seed.		Rows.	Yield. bush
Early Ohio	1½ bus.	small seed.	4¾	11
Bliss's Triumph	½ "	" "	⅝	2
Early Vermont	1 "	large "	4	12
King of the Earlies	2 "	small "	12	38
Beauty of Hebron	3¼ "	medium "	16	50
Pride of America	½ "	large "	1¾	5
Magnum Bonum	1 "	" "	5½	12
Queen of the Valley	1 lb.	" "	30 ft.	¼
Adirondac	1 "	small "	30 "	¾
Brownell's Beauty	½ bus.	" "	1 row.	1½
St. Patrick	1 "	" "	4 "	12
Burbank's	½ "	" "	1½ "	4
Peerless	½ "	" "	1 "	1½
Dunmore	½ "	" "	1¼ "	4
Mammoth Pearl	½ "	large "	1½ "	4
Bliss's Imp. Peachblow	½ "	small "	1 "	1½
			159	

Thus at the time of digging the yield was 159 bushels of tubers, costing $80.85, or about one cent per bushel more than it would have cost to buy the potatoes, counting nothing for the value of the new varieties over the old ones. It is proper to state that no rain fell on the potatoes after July. On July 4th three-quarters of an inch of rain fell, and on the 11th one-sixteenth of an inch, followed on the 14th by one of the driest days, the wind blowing hard from the northwest and killing the leaves on the vines. This will account for the light yield of the later varieties.

I am now positive that the Burbank and the St. Patrick did originate with different parties, although they look very much alike in growth of tuber and vine, and the time of ripening is the same. The St. Patrick will rank as first quality; the Burbank, second. Both are good croppers. The Magnum Bonums were uniformly large, and it is a desirable potato. The Beauty of Hebron is first this year for size, productiveness and quality. I raised 17 pounds of the White Elephant from two ounces of seed—nice potatoes so far as tested, though not high enough in quality, as they cook a little heavy. They may do better hereafter.

Pride of America is the only variety that has rotted any, and this has not rotted badly; otherwise it is a nice, smooth, desirable variety. Mammoth Pearl will take a front rank, being of good form, running large, and cooking dry and fine. Queen of the Valley did well, considering how the dry weather hurt it. Adirondac has the appearance of the old Peachblow; it did pretty well, being late. Early Ohio, to get a crop, must be planted close, as it will only turn a few to the hill of even-sized tubers, that are among the earliest, and cook dry and mealy as soon as they are large enough to dig.

The potatoes were plowed under every third furrow and planted about ten inches apart in the furrows, the furrows being also ten inches apart. I intend to put on double the quantity of barnyard manure next time, and drop the potatoes six to eight inches in the row. I shall harrow as soon as the potatoes come up, first turning a ridge over the vines, thus saving the cost of hoeing, and tending the crop better. We had a wet spell at the time this should have been done this year and it took all the profit for the hoeing. Among all the potatoes that I have a knowledge of the Ohio, King of the Earlies, Beauty of Hebron, Magnum Bonum, Mammoth Pearl and St. Patrick I think the best.

Titusville, N. J.

TOBACCO-GROWING NOTES.

A TOBACCO barn should stand in a sheltered location or where it is not exposed to driving storms. The usual shape of these buildings being long, narrow and high, they are more liable to injury from heavy gales of wind than most other outbuildings. It is also preferable that they extend north and south rather than east and west. This applies to localities where the prevailing winds are northerly.

IN times of dry weather, after tobacco has become nearly or quite cured, the leaves are very brittle and if handled or in any way disturbed while in that condition, the soundness of the leaves is impaired. For this reason great care should be exercised that strong winds should not be allowed to blow directly upon the plants when dry, as it will always cause damage to the crop. A tobacco barn should be so made that strong winds may be excluded when desired, or so that it can be amply ventilated when the condition of the weather is damp and "muggy," which is otherwise liable to cause damage from "pole-sweat."

TOBACCO-curing barns are usually made to contain three, four or five tiers of hanging plants according to their hight, with a half tier extending through the gable end of the building and supported by purline plates. The barn for three tiers is preferable, although the cost of a building to contain a given number of acres is more than when made to hold four or five tiers of plants. The following are the objections to high tobacco-curing barns: 1st. The labor of harvesting a crop is increased with the hight the plants are hung from the ground. 2d. The quality of the tobacco is not so good when cured in the upper tiers of a high barn, probably because it cures too rapidly there. 3d. The barn itself is more liable to receive damage from high winds. Growers who contemplate building curing barns will do well to consider these points.

IT is not safe to judge of the profits of tobacco growing from the results of a single year's crop. It must be remembered that once in a period of five or six years a crop is quite certain to receive serious damage from the elements, which tends to reduce the profits of that year's crop, if it does not result in positive loss when all things are taken into account. Storms of wind or hail sometimes cause almost entire ruin to a crop while standing in the field, and I have myself, within the past fortnight, suffered heavy loss from the result of a terrific cyclone which completely demolished a tobacco barn filled with a recently harvested crop of tobacco, which was, of course, almost destroyed. The profit from one crop may seem almost fabulous, while the following year may result in little or no gain owing to unfavorable weather. G. A. G. JR.

Elmira, N. Y.

Sheep Husbandry.

THE OXFORDSHIRE DOWN SHEEP.

THE OXFORDSHIRE DOWN is a comparatively newly-established breed which has lately been gaining a high reputation on this and the other side of the Atlantic. In 1838 Mr. J. T. Twynam, of Whitechurch, Hampshire, the chief originator of the breed, describing its origin, in the Farmers' Magazine, said that six or seven years before he had introduced an improved Cotswold ram among a few Hampshire Down ewes and the progeny soon convinced him of their vast superiority. He continued his efforts to form the breed, but his plan was in direct opposition to the general opinion respecting crossing, for, instead of going back, after one cross, to the original breed on either side, he used half-bred rams with half-bred ewes—a practice he found condemned by three-fourths of the old school of breeders. In 1857 the breed received its present distinctive name; but it was not until 1862 that it was awarded a separate class at the English fairs. In addition to its strain of South Down blood through the Hampshire Down, the Oxford Down also received a draft directly from crossing South Down ewes with Cotswold rams, the progeny being used with crosses of the Cotswold and Hampshire Down in the formation of the breed. To produce large size, however, the latter cross was that chiefly employed. The progeny was a sheep heavier than the Hampshire Down and more closely resembling the Cotswold in size and fleece. The wool, however, is finer and firmer than that of the Cotswold and from five to eight inches long. Of the various Down breeds the Oxfordshire alone is classed among the long-wools.

A sheep of this breed has a head a good deal like that of a Cotswold, with a tuft on the forehead, but the great prepotency of its remote ancestor, the South Down, is manifested by the dark color of its face and legs, a characteristic transmitted through its immediate ancestor, the Hampshire Down, which was formed, 75 years ago, by a cross between the South Down and a white-faced, horned sheep, a native of Hampshire and the adjacent districts. The Oxford Downs are nearly as large as the other long-wool breeds, the Cotswold and Leicester, and yield nearly the same quantity of wool, which is thick-set and somewhat curly, and in great demand for the manufacture of worsted. They have a long barrel, short legs, and yield a large quantity of mutton, which, when under two years old, is claimed to be better than even South Down, though inferior to it when over two years. It is the excellent quality of their meat rather than the high value of their fleece, that is giving them a "boom" just now in England, for prime mutton there is now profitably high-priced and is likely to continue so, while the great increase in the growth of wool in Australia, New Zealand and South America, and the vast scope for producing it there on land of nominal value, are pretty sure to keep down the price of wool in Great Britain.

Oxford Downs were first introduced into this country by R. S. Fay, of Massachusetts, and Hon. W. C. Rives, of Virginia. The former found them of good constitution and better adapted than South Downs to rough pastures. In England they are found to thrive on wet soils on which neither the Cotswold nor South Down could get along well. They are very hardy, active and excellent foragers, requiring little purchased food and standing winter exposure well—at any rate in a climate like that of England, destitute of extreme severity. The cut, Fig. 511, re-engraved from the Agricultural Gazette (Eng.), represents a very fine ram of this breed owned by Mr. Charles Howard, one of the oldest and most extensive breeders of Oxfordshire Downs.

The Vineyard.

SEEDLINGS FROM HYBRID GRAPES.

THERE seems to be some inherent difficulties, such as the violation of some law of nature, pertaining to plant life, in our attempts to obtain improved grapes from hybrid plants. I have grown a good many of these hybrid seedlings, and seen a good many more originated by other horticulturists, and I do not now know of a seedling of much practical value from a hybrid grape. There seems to be little known upon the topic, and few observations of experiments recorded, but what positive knowledge we have is not in favor of hopeful results from this class of seedlings. Of course, there is no sterility in the case under consideration; but such seedling grapes are usually of feeble habit, and when one does grow vigorously, it seemingly discards its dual origin, and goes back to the side of the stronger parent. I have grown, and seen many seedlings of the Delware; not one of them approaches the parent in the quality of its fruit, and most of them are imperfect in their reproductive organs. A like rule seems to hold good for all vines of this class. As near, then, as we can arrive at the matter, it is the tendency to revert that prevents success or improvement in these seedlings, and all hybridists and propagators should carefully note this law of nature. This tendency to reversion seems to be greater in hybrid than in unmixed plants. Improvements are usually gained by slow processes, the change in hybrids is too sudden, and seems to violate nature's methods. D. S. M.

Miscellaneous.

RURAL BRIEFLETS.

WE are glad that more attention is being paid to the improvement of the watermelon which is so unlike all other fruits and which when grown in perfection is scarcely excelled by any other. But this can rarely be said. Farmers have hitherto looked too much upon a watermelon as being a watermelon an they have been correspondingly indifferent as to the variety planted. During the past season we raised six different kinds, and two of these—the one below noted and Cuban Queen—were so superior to the well-known Black Spanish and Carolina that we should never cultivate the latter again if the others could be obtained.

.....

WHITEWASH the hen-houses. Clear out and put in order the stables and cattle sheds. Attend to all painting at this season of the year: there is no better time. Cut out the old canes of blackberries and raspberries. Prune grape-vines. Bank up celery. Weed the asparagus beds and spread salt and manure after the first hard frost. Prune currant bushes. Prepare the covering for strawberry beds. Collect bean poles and pea brush and store in a dry place. Provide lime for Winter use. Give the cellar a thorough overhauling, cleansing and whitewashing. Construct frames for vegetables, roots and plants. Collect seeds of nut-bearing, late peach and ornamental trees and shrubs; mix with sand, place in boxes and bury the boxes in well-drained soil. Raspberries, blackberries, currants and gooseberries may still be planted, better, indeed, than in the Spring. Hill the earth about the newly-set plants somewhat and cover each with a shovelful of coarse manure. It is a good time to plant grape cuttings. Set them at an angle in trenches and pack the earth firmly about them. Let the cuttings include two joints and place them at such a depth that the upper end of the cutting shall be one inch out of the ground. Then cover with hay or straw.....

ALL who admire the incomparable beauty of beds of spring-blooming bulbs should now prepare the ground and plant them. Is there anything in the floral world more gratifying than the brilliant colors of hyacinths and tulips blooming in all their brilliancy while yet the leaves of trees and shrubs have not unfolded? Crocuses, crown imperials, anemones, oxalises, ranunculuses had better be left until Spring.....

IN selecting hyacinths choose every color that any trustworthy catalogue mentions—dark and light blue, rose, red, deep red, white and yellow.....

IN selecting tulips choose those which will insure the longest season of bloom. The earliest are the Duc Van Thols-crimson, red, white and yellow, growing about six inches

high. These may be planted in pots and forced in the house. The Tournesols come next, bearing large pæony-like double flowers which, though less showy and desirable to our taste than the single kinds, last a longer time and serve to connect one class with another. Then follow the Single Early Tulips; then the Parrots, the dashiest of flowers; and finally the Late or Show Tulips, the showiest and everywhere the most prized of all. They are placed in three sub-classes viz., Bizarres which have a yellow ground marked with other colors; Bybloems, white ground marked with violet and purple; and Roses, white ground marked, splashed or variegated with cherry, roso, etc.....

THE preparation of soil for tulips and hyacinths is very simple. Let it be mellow, deep and fairly rich. Set the bulbs any time before the ground freezes, three or four inches deep. Instead of removing them after they have bloomed, as many do, to be replaced in the Autumn, we set bedding plants between the tulips and hyacinths, cutting off and removing their leaves as soon as they begin to decay. Hyacinths give their handsomest blooms the first year. But large, heavy bulbs will bloom satisfactorily for from three to four years, though each succeeding year the racemes bear fewer flowers Tulips, on the other hand, continue to multiply from year to year and our experience has been that they had better remain undisturbed for three years. Then they may be dug up, separated and replanted, again to remain three years.....

NEARLY all of the so-called Spring bulbs may be grown in the conservatory or window garden. For this purpose, Fall catalogues give ample direction.....

THE wash for trees that suits us as well as any, is one made of quick-lime, sulphur and whale-oil soap. The quantities need not be given since it is only necessary that the wash should be of about the same consistency as the lime wash applied to walls, or a little thicker. A tablespoonful of flour of sulphur for every 25 trees suffices, and the soap should be cut up in bits and with the sulphur be added to the quick-lime before it is slaked. As we have often stated before, a small quantity of lamp black or dark-colored mineral paint, which may be purchased at any grocery store for five cents the pound, will color the wash so as closely to imitate the color of the bark. As a protection against rabbits and mice this wash is excellent, as we know from experience.

.....

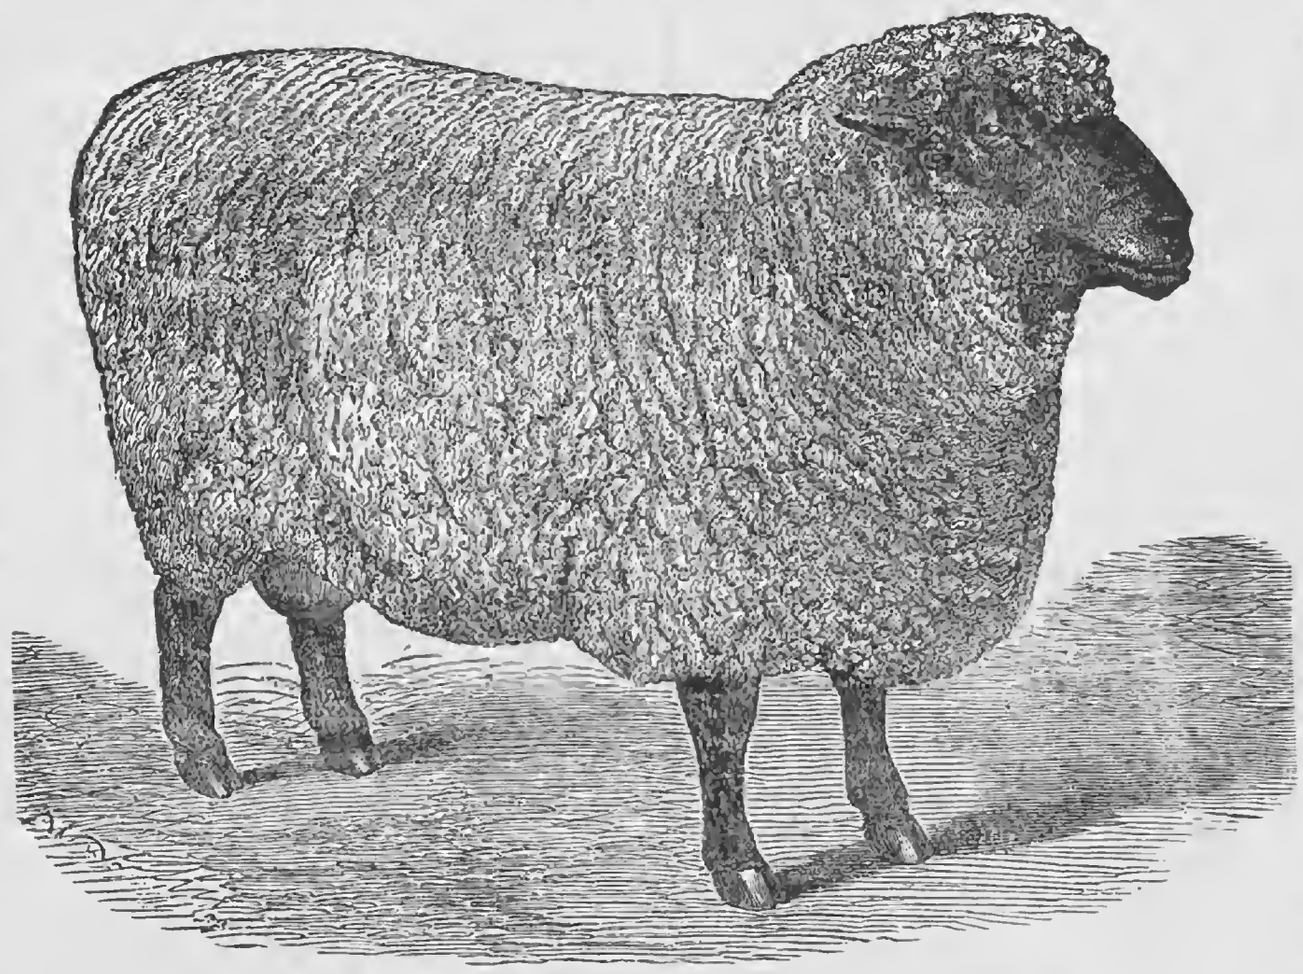
SPEAKING of watermelons, we have yet to speak of one which is, we think, the best ever raised at the Rural Grounds. The label thus imperfectly gives the name and address. "B. F. Rogers, Orville, Atlanta" which is the only record that can be found of the sender or his whereabouts. The melon is "thinner-skinned" than the Cuban Queen, and the flesh sweeter. The single hill planted bore four melons, all much alike in excellence, "thinness of skin" and size. The largest and earliest weighed 21 pounds and measured 9½ inches in thickness and 17 inches in length. It ripened August 25. The skin is light green with very dark green (nearly black), broad, irregular stripes. The rind or white flesh is not more than half an inch in thicknesss—the flesh a deep red and very solid. The seeds are white and small.

What Others Say.

PERENNIAL FLOWERS.—A dear old lady, who has gone where all flowers are supposed to be perennial, says Annie L. Jack in the Sixth Report of the Montreal Hort. Society, always met me in the Spring with this sentence; "Gi' me flooners that dinna dio i' the Fall, sic as keep the groound a' Winter." And in her garden the earliest and brightest tulips grew, the pale narcissus in profuse bunches, the sweet-scented violet perfumed the air, and the earliest gowan (daisy) showed its tiny star. She had a bunch of lilac and snowball for every caller, and the crimson pæony was her delight in its season. Tall, blue larkspurs reared a stately contrast to the spiræa, and the monkshood and snapdragon made mouths at the children who chose to squeeze their long tubes. The words of my friend have occurred to me often when fighting with drought and insects to save the annuals, that were doomed at best to give only two months' bloom. Even geraniums have a glaring sameness and newness that seem too conventional for beauty, and greenhouse pets count as so much money from the purse. Of course, in a Canadian climate we are not supposed to be able to save delicate plants out-of-doors, but I think even this a fallacy, for the snow of our Winters is in itself a better protection than the wrappers given a little further south to prevent freezing and thawing. A little forethought in Autumn will give in Spring a wealth of bloom from flowering bulbs, snowdrop, crocus, tulip and hyacinth. Then, before the roses come the Lily of the Valley, and, among other hardy plants, the pinky, white, heart-shaped bells of Dicentra spectabilis. The varied members of the family dianthus, which signifies "The Flower of God," are remarkable for hardiness and beauty, the China pink especially, coming into bloom in early Spring, when only a year from seed, and the old-fashioned Sweet William a little later. All the plants I have mentioned are as easily raised as vegetables, and well repay cultivation; even in city gardens they should have a space for their sure if not fashionable beauty. Nothing can exceed the display made by a bed of perennial phlox, and its variety is such that bloom may be had from May till October, of every shade and color. The Scarlet Lychnis is another herbaceous plant of value, and the double hollyhocks are not to be despised The perennial pea stands the most trying Winter, and so do the pansy and forget-me-not. While I have tried and "found wanting" many so-called hardy shrubs, I have a few faithful friends that give a show of bloom: the deutzia and syringa in early Summer; later, the Rhus cotinus or Smoke Plant, and the althæa; while quite late in the season, the new Hydrangea paniculata gives immense trusses of white blossom, and has proved hardy the last three Winters. It would be an improvement in our gardening if some of the old, tried favorites were re-established, and less time and trouble bestowed upon new and short-lived plants that are not sufficiently superior to deserve the attention bestowed upon them.

SHIPPING FAMEUSE TO ENGLAND.—Our valued contributor, Mrs. Annie L. Jack, made a few remarks before the above society respecting shipping the Famense Apple to England. Some years ago, allured by the promise of high prices, she decided to ship a few barrels of Famense to Liverpool, and although they reached their destination in good condition, and were consigned to commission men of well-known integrity, the result could not be called a success from a financial point of view. The sales were from four to five dollars per barrel, but the expense of freight and other costs reduced this by one-half, which, counting in the *risk*, is hardly profitable. It would be well for those interested in shipping Famense from Montreal and its vicinity, to consign the business of sales into the hands of some *one* dealer, and to send in separate consignments, so that this choice table apple may have all the advantages of successful sales instead of, as is often the case, going in with a mixed lot of inferior fruit. If growers would combine with this end in view, the Famense of that Province would soon win for itself, and retain, a name in the English market.

VALUE OF THE BLACK WALNUT.—In an address on Forest Tree Culture read before the Montreal Hort. Society, Hon. H. G. Joly, speaking of the Black Walnuts, says that the value of the wood is so considerable (a dollar a cubic foot at the present time) and it is getting so scarce that it struck him as the most worthy of being introduced and cultivated there. True it did not grow spontaneously anywhere in the Province of Quebec, but this appeared to him no conclusive reason why it should not grow and flourish there. He did not fear Canada's great colds, for in the West, the natural home of the Black Walnut, the thermometer often ranges as low as there, though for a shorter period at a time. He procured a bag of Black Walnuts from the West in the Fall of 1874, and sowed them at once; it was late in November; he had to remove the snow and break the frozen ground, but he thought the earth the safest place to Winter them. They began to come up about the tenth of June following; not five per cent. failed, and they have never been artificially sheltered in any way. Of those left undisturbed where they were sown, he has not lost one; they have now had six Summers' growth. He had just had some of them measured, so as to be certain of their size; the hight of the four largest was as follows: 15½ feet, 14½ feet, 14 feet and 12 feet, and they were thick in proportion. Some of the trees were transplanted when two years old, but they had made a comparatively feeble growth. Wherefore Mr. Joly concludes that it is better to sow the seeds where the trees are to remain.



OXFORDSHIRE DOWN RAM.—AFTER LONDON AG. GAZETTE.—FIG. 511.

GETTING RID OF STONES.—One may well pity the farmer whose soil is too liberally provided with stones, and who struggles with them day after day, and year after year, without making much impression upon the overplus, says Mr. Stewart, a regular contributor to the Times. The life-work of many a farmer has been, and is, to get rid of the stone from his fields. Monstrous walls have been built up around the fields, which are but little less troublesome in this position than when scattered over the ground. The easiest way to get rid of stones is to bury them. This is done with far less labor and in less time than drawing them from the field; there is but one handling of them, and they are out of the way forever. The whole work may be done with the plow and a stone-boat. A trench may be plowed out two feet deep in a short time, and if necessary may be deepened in places to receive the larger stones that are not too heavy to be lifted or rolled on to the stone-boat. Two such trenches may be made at a convenient distance apart, so that a load may be picked up in going from one to the other and avoid the necessity for taking heavy loads or turning around. When the trench is filled to within a foot of the surface the soil may be plowed back on to the stone and leveled with a harrow. The stones will be below the reach of the plow and will never afterward give any trouble. Larger stones should be buried where they lie by digging holes of sufficient size and toppling them over by means of a lever or a grab-hook and chain. Rocks that are too large to be handled in this manner may be shattered by a charge of dynamite. Dynamite is the most effective agent for breaking stone. A mass of 10 or 20 tons may be broken into several pieces by exploding a pound of it under the rock. A hole is driven under the rock in the earth with a crowbar and the cartridge is inserted. A fulminating cap attached to a fuse is first fixed in the end of the cartridge. The hole is filled with dry sand or even water, and the fuse is lighted. The shock usually shatters the mass into a few large pieces which can be handled with a bar, and where the stone is desired for buildings of any kind, this method is the best possible. Stone may be split in regular shapes by means of steel wedges. A few half-inch holes three inches deep are drilled on the line of the desired fracture, and the wedges, protected on each side with a strip of soft iron, are inserted in the holes. The wedges are struck somewhat lightly in regular succession with a hammer, and after a few blows the stone splits along the line of the drill-holes. Everlasting gate-posts and foundation-stones for buildings, may be thus split from large rocks with little trouble.

ADVANTAGES OF MICHIGAN.—Secretary Charles W. Garfield recapitulates the advantages of Michigan in his recently published "Glimpse" at her Horticulture, as follows:—

Michigan is practically free from debt; her public institutions are her pride and her educational system is commended by the best educators in the country.

The agricultural advantages for mixed husbandry are of the very best; the climate is not equaled by any Northern State; the air is clear, the water pure, and the variations in temperature comparatively slight.

The landscapes are beautiful, and a wide range of fruits, plants, flowers and trees, that form the accompaniments of a well embellished home, can be grown successfully.

Delightful resorts are near at hand everywhere: and a refined and intelligent people make up her present population.

Michigan has a motto upon her coat of arms, *Si quæris peninsulam amœnam circumspice:* if you wish to see a beautiful peninsula, look about you. That is no flaming advertisement of exaggerated proportions, but is a simple introduction to those who enter our borders, the apparently complimentary language of which is found by every visitor to be a truthful statement.

The old derisive songs that told of ague, marshes, rattlesnakes, and wolverines as the natural products of Michigan are not sung any more; and none visit the Peninsular State who do not go away with pleasant accounts of her climate, soil, productions, and people.

PACKING FRUIT.—Select perfectly sound specimens of apples and pears, says Dr. Calder, and pack them in boxes or barrels in common land plaster or gypsum, using first a layer of fruit and then a layer of plaster, using as much fruit as possible without having the specimens actually touch each other. Close the package and lay it away in some cool place where it will not freeze. The plaster will exclude the air and keep the fruit at an even temperature, and it will be found perfectly preserved after a very long interval.

MR. BUCKE, of Canada, calls attention to the fact that the raspberry may be transplanted at any time during the year, whether in full leaf or otherwise, if a good spadeful of earth is raised with the plant, the hole in which it is to be deposited having been previously made. He usually fills up gaps in the row with present year's young plants during the month of August, and finds they succeed better when they have time to take hold with their roots before the season's growth has fully ended.

PRESERVING GRAPES.—The method of preserving grapes adopted by Mr. Roe, as we see by the Christian Union, has proved very satisfactory to him after several years' experience. The grapes are picked on a dry, clear day with grape scissors, so as not to handle them much, and all imperfect berries and those not fully ripened are removed. They are then placed in clean, dry earthen jars in layers a bunch deep, dry straw paper is placed between the layers, and the jar filled in this way. A double sheet of paper is placed over the top layer and the lid then put on. Strong, unbleached muslin is pasted entirely over the lid, or cover, of the jar, completely covering the opening so that no air may enter. When this covering has fully dried and hardened the jars are buried on a dry knoll sufficiently deep to be beyond the action of frost, a stake being placed over each jar to locate it accurately. Isabellas have been kept in this way until late in February, and have proved excellent.

DR. LAWES says, in the Albany Cultivator and Country Gentleman, in a field close to his house, sown with mangels and manured with barnyard dung, he noticed in the month of June a broad strip in the middle, measuring about one acre, upon which the mangels were much better than in the rest of the field. As the manure applied to the crop could not possibly have produced this effect, he inquired further into the matter and found that where there is now one field there were formerly two,

separated from each other by a hedge having a very broad margin of grass on each side. About 33 years ago the hedge was removed, the grass was plowed out, and the fields were converted into one. He had samples carefully taken both of the soil upon this strip and of that in the middle of the field on both sides; these are now being analyzed, but it is by no means certain that any appreciable difference will be detected in the composition of the soils: there is, however, the fact of a marked improvement of the crop, due to grass that was plowed up 30 years ago.

DR. LAWES thinks that the United States farmer will be wise in using phosphates for the growth of corn, so long as they continue to give him a good crop; and at all events, if they fail to do this, they will remain in the soil, and can at any time be made available for vegetation by the use of some nitrogenous manure; whereas, an application of ammonia or nitrates is irretrievably lost, if not taken up by the growing crop.

WHEN GOOD FARMING DIDN'T PAY.—It may be stated as a fact, remarks the Live Stock Journal, (Eng.) that the best farmers have suffered most from the wet weather of the past two months. Their expenditure in labor and manures has produced heavy crops, which have gone down under the storms. So also is it true that a poverty-stricken crop suffers comparatively little from bad weather, both before and after it is cut. Well developed crops, full of vigor and substance, are much more open to the ravages of inclement seasons. Thicker on the ground, they dry slower when a fine day comes; and the chronic dampness promotes fungoid growths and germination of the ripened grain, while not a few of them ripen the more "unkindly" in the absence of the sun.

THE year throughout, the above journal concludes, must be set down as a bad one, and the prospect for the winter is gloomy enough in consequence Grass is still fresh and green for the most part, but the land is sodden with wet; hay and turnips are far below last year's crop; feeding-stuffs are high in price, and stock are low; but, above all, the harvest in many counties cannot but be reckoned as a disastrous failure, though not so much so in yield as in quality.

A WRITER in the Agricultural Gazette of England says that milk from good cows, well fed and well housed, will contain over 12 per cent. of "solids." Milk from ordinary cows, poorly fed, will not contain more than 11½ per cent. of solids. Now it is the solids in the milk that produce our cheese and butter, and as the difference between 11½ and 13 is about 14 per cent., it follows that our yield of cheese and butter might be thus most materially increased.

"OH, dry up!" as Autumn said to the leaf. "I'm not so green as I was," replied the leaf: "so I'll take your advice." . . . . . One hundred and ten thousand dollars for a lot on Fifth Avenue, on the corner of Seventy-fourth Street, 29x150 feet. This is the highest price ever paid for a private lot on this island. . . . . At a trial of the audiphone before the authorities of the National Institution for Deaf Mutes, at Paris, it was found to be useless. . . . . When a man has no mind of his own he can always find a woman who will give him a piece of hers. . . . . The New England Farmer asks, when will farmers learn to provide themselves with more than a single year's supply of food for themselves and their stock, instead of throwing themselves upon the mercy of speculators and gamblers. . . . . In pruning currant bushes, says Mr. Bucke of Ottawa, Canada, they should be kept moderately open; the red and white bear best on two and three-year-old wood, never on one-year-old; and for this reason a few suckers should be allowed to grow up each year, and the four-year-old stems should be removed with the knife. A stool of six bearing stems with three suckers would be about the correct thing for a model plant, but circumstances will frequently remodel the idea in all bush and tree culture. . . . . SPEAKING of tenants' rights the Mark Lane Express says: It is a kind of religion—a fetish-worship. "Fear God, honor the king, and knuckle down to your landlord"—that is the piousa djuration still current . . . . . It has been a kind of "Open your mouth and shut your eyes, and see what Providence, in the shape of your landlord, will send you." The moral effect has been similar to that of the hope that something "may turn up," so well satirised by Dickens . . . . . When nothing more than justice is asked for, there is no occasion to beat about the bush. The mealy-mouthed season has been perennial too long . . . . . In a wooded ravine near Egbertville, Staten Island, says the Bulletin of the Torrey Botanical Club, there is a vine of *Vitis cordifolia* (Winter or Frost Grape) having a circumference of 25½ inches at a point three feet above it base. It completely covers three cedar trees, each at least 30 feet high, and is a very beautiful plant.

Everywhere.

RURAL SPECIAL REPORTS.

Canada.

LISTOWEL, Ont., Oct. 12.—Most of the seeds of last year were unsuccessful, but the Hibiscus Syriacus, and Hibiscus Moschentos both grew and died down for the Winter. I carefully covered them, and in the Spring I was glad to see them again come up, and by the latter end of June could see the flower buds, but a cool day or two seemed to check them and they turned yellow and fell. The unusally hot weather of August and September brought others forward, of which only one opened and that was imperfect, and so the H. Syriacus has disappointed me much as it seemed to prove that this climate was too cold for it. Mold's Ennobled Oats were again sown, but though the yield was good they were very light. The Washington Oats were good and did not rust at all. So much for the old seeds. The Giant Purple Dutch Asparagus came up very thin and Argenteuil hardly grew at all, not making over six plants. The seeds of the dianthus started early in the house and were planted out; they have flowered well and been much admired. The carnations, too, look well. I raised quite a number of the plants and shall look forward anxiously to see them bloom. The Rural Branching Sorghum seems to have come up better with me than with many others, as only six hills missed out of 36, and when I cut it at the end of September it ranged in hight from two to four feet, and when the frost came on Oct. 3, the tallest bunch was just coming into head. The cow I fed it to liked it much. I think I have a few seeds left, and will try again, but am afraid the season is too short to get the full benefit of it. The White Elephant Potato also did well. I kept the seed potato in dry sand all winter and it came out quite fresh in the Spring, and I cut it into nine pieces, an eye to each, and planted them at the end of May, hoed them well and dug them the last of September. I did not weigh them, but should put them at about half a bushel. There were 59 tubers, the smallest as large as the seed. Though they do not yield like the Beauty of Hebron, I value your last collection very much. The crops round here are all housed and thrashing has been going on for some time. Wheat is turning out much better than expected, and the Spring crops are unusually good; so is the potato crop in spite of the bugs which, though numerous in the Spring, did but little mischief; some even did not pick them at all. The White Elephants were infested the worst as they were green when all the rest were dead-ripe, and the pest literally swarmed on the vines. Wheat $1.37; peas, 70c.; potatoes, 50c. to 60c. per bushel; eggs, 15c. per dozen. Peas are very free from bugs this year, but the caterpillars swarmed on the cabbages, and where not picked the pests in some cases about ate them up. A. J. C.

TRENTON, ONT., Oct. 17.—The White Elephant Potato, cut to single eyes, I planted on April 17, in 12 hills, one eye to a hill, in good garden soil. I am somewhat disappointed in the crop, for, judging by the growth of the tops, I expected an immense yield. I dug them September 12, and got 14 pounds. The asparagus seed germinated nicely and is doing well. I sowed the Washington Oats April 30, in drills 12 inches apart, seed four inches apart in the drill. They grew splendidly, being five feet high, and many of the panicles having from 150 to 170 grains. I had the misfortune to have them badly ruined just as they were fit to cut. I was, however, still able to save one peck of seed for another year. I planted the Rural Branching Sorghum on May 27; but it was a failure, for what few seeds germinated made a very poor growth—not over four or five five feet in hight, not nearly as good a growth as corn planted alongside, I sowed the flower seeds in a box in the house. I think every seed germinated. They were transplanted to garden as soon as the weather permitted, and we were well rewarded for our trouble, as we had a magnificent display of pinks. The seeds are worth much more than the price of the RURAL. W. H. L.

Illinois.

VOLO, Lake Co., Oct. 18.—I have lived on this farm for 36 years having come from Long Island. Then this place was in a state of nature; now it is the handsomest country I have ever seen, and the best land for mixed farming. It is like a nobleman's park in the Old Country, throughout. The county is bounded on the east by Lake Michigan; on the west by Fox River, and on the North by the State of Wisconsin. There are 40 lakes in it with the Oplain River crossing it, so there is a good supply of water and timber here. Some of the lakes are Summer resorts for the Chicago people. Fox Lake, which is the principal one, is five miles from here. We have had no frost here yet. The last week there was very heavy rain. The month of September had the heat of July with April showers all through it. Our drought was of short duration here. The grass was only about one week turning brown when the Fall rains came; then it commenced to grow; now it looks as it did in June. Not much Fall grain is sowed here, but what is looks good. There will be an abundant supply of fodder for the coming Winter, although a great quantity of hay in swath and cock was lost in July on the bottoms from the heavy rain we had then. Potatoes a light crop. Corn about 80 per cent. of last year's crop. Most of the oats were lodged from the heavy rain and wind in July, so they did not fill well. Wheat a poor crop. The Washington Oats I planted in drills on a clay knoll in my orchard—I put them in the poorest place I could find so that they would not grow too much straw; but the rain and wind in July laid them flat on the ground. There were a few blasted ears among them. I had five pounds of very nice oats; I think they will do well in this climate. Of the Rural Branching Sorghum only a few seeds grew, but they made a wonderful growth; they branched so from the roots that they covered about half the ground, and that would not do, but they must, when the seed began to turn white, commence to branch from the upper joints and from four to five of these branches on each stalk have seed heads; but I do not expect they will mature; it is too late in the season. I have a quantity of heads tied in bunches and hung up for seed well matured. I think the Rural Branching Sorghum the thing to have in a dry time to keep cows to their milk. I cut a few hills the 10th of September; the cows relished it although grass was flush. Those hills grew a second growth three feet high. The asparagus did not appear until July. The plants are growing finely now, The baby elephant I received weighed about two ounces. I dug them the first week in September. I got 27 pounds. They are a nice sample of potatoes; the heaviest weighed one pound a piece. The flower seeds did nicely. I have a nice lot of Cuthbert Raspberry vines. I am going to transplant them shortly; they bore a fine lot of fruit this season, having stood the Winter well, though one day the thermometer went down 25° below zero, with no snow on the ground. I like the RURAL NEW-YORKER very much. I would not be without the seed I have raised of the Rural Branching Sorghum for the price of the paper for one year. T. D.

Indiana.

ELKHART, Elkhart Co., Oct. 16.—Just as in most of the other parts of the country, it has been a very dry season here. The Rural Branching Sorghum is doing finely; nearly all the seeds came up. The Washington Oats did well. Old farmers to whom I have showed them say they never saw such oat heads. This year I have taken more pains with my garden than ever before and find it pays. Before this year I never attended a fair; but acting on the RURAL'S advice I went to our fair the other day, with 30 different varieties of vegetables, and came away with 34 premiums. I spent three days at the fair, beheld many new things, learned a good deal and saw the people, some of whom I had not seen for 20 years; and the visit paid well, too. This pleasant and profitable change I attribute entirely to your paper. Never has the ground been so wet as now, and it is still raining. Potatoes rotting somewhat. W. B.

Iowa.

APLINGTON, Butler Co., Oct. 10.—The Washington Oats I sowed in the garden. I cannot speak very highly of them; think the straw is too weak for this place and would be liable to lodge. The Rural Branching Sorghum I think fully equal to your recommendation; but it ought to be put on very clean ground, on account of its slow growth when it is young. My White Elephant came all right, but when I dug it out of the sawdust I thought it a mouse instead of an elephant. Its weight was just one ounce. It had eyes enough for an elephant, however—eight of them—which were planted one in a hill. They had the same care as my other potatoes and no more. This Fall from those eight hills I dug 70 tubers, which weighed 17½ pounds. I think that is a pretty heavy increase. We are having a very wet Fall. Grain is not half thrashed. Crops of all kinds are very poor. Corn is broken down very badly, and is growing in the field on account of warm, wet weather. There are but very few farmers who know the value of pumpkins. It costs nothing to raise them with corn. Feed them to hogs; there is nothing better for them than the seeds. Try it and see how quickly their cough will stop. L. E. C.

EARLVILLE, Delaware Co., Oct., 21.—The flower seeds I handed to the domestic department. We anticipated the pleasure it would give to see them in blossom, but, alas! they were destroyed by chickens and mice when they were about to blossom. The asparagus I put in drills one foot apart, so that I might hoe them. After putting in the seed I put some radish seed and some small sticks also in the drills and then covered the seed with a garden rake. The radish seed grew. I hoed between the drills but the asparagus did not make it appearance. Will it be likely to grow next Spring? [Think not.—EDS.] I planted the Oats on one perch of ground; they grew strong with a stout straw. From their appearance in July I expected nearly one bushel; but black smut appeared and then red rust followed very bad. Soon after they broke down and lay flat on the ground, I have not over one quart of good oats. The potato I cut into ten pieces, with one eye to each. I planted them the first week in May. One plant was very weak: the others grew strong. I dug them September 1, and had two common buckets full of good tubers, some very large, and nearly all of good marketable-size potatoes. I had a few cooked, and they were of splendid quality. The Rural Branching Sorghum I planted May 10. About one-third grew. I did not follow your directions but experimented on it, but I state with confidence it is a very valuable plant for cattle feed, if first cut in August. I cut one-quarter of it September 1, about six inches from the ground, I also cut a few two feet from the ground. In a few days shoots started out in a thick cluster, and it would have produced a large amount of feed had I cut it one month sooner. The remainder I let stand for seed, as I wanted more for next year. It grew eleven feet high with abundance of seed; it is not quite ripe but I cut it to-day when it was quite green, fearing a frost might destroy it. The seed is hard so I think it will germinate. I think I have enough for an acre or more. To raise seed yearly I think in this latitude we must raise plants in boxes and then transplant them after frost is gone. None of these seeds had any manure. They were grown on a rather light, sandy loam. The ground for potatoes was manured last year. The first frost to affect tomato vines came this morning. Oats not half our usual crop. Potatoes the same. Early planted corn good for the year, but by far the greater part of it was planted late. Many pieces will not yield over ten bushels per acre. W. C. C.

ROCK FALLS, Cerro Gordo Co., Oct. 17.—The weather around here has been very wet for the last six weeks, and we have been deluged with rain the last few days. There has been hardly any thrashing or plowing done this Fall. The seeds from the RURAL have done well except the Washington Oats, which rusted and never filled; and the pinks were destroyed by the black potato bugs, just as they commenced to flower. The asparagus has done very well, and we will have a lot to transplant in the Spring. The Rural Branching Sorghum seeds all grew, but the stalks were not cut off in time for another growth. The White Elephant Potato was cut into 21 eyes, but only 15 came up. I dug 90 good-sized tubers, weighing 22 pounds. W. W. W.

Kansas.

GRANADA, Nemaha Co., Kan., Oct. 20.—As in most all other places, it was very dry here until recently; now, however, we are having fine showers which are causing grass and wheat to make a fine growth. Our chief crop, corn, will be but about one-third of a full crop. My Rural Branching Sorghum is about seven feet high and green. I gathered ripe seeds from it three weeks ago. My White Elephant Potatoes did well considering the drought; but they resemble the Early Rose in every particular. They ripened as soon and blossomed at the time. L. H. S.

Massachusetts.

CHICOPEE FALLS, Hampden Co., Oct. 18.—The White Elephant potato you sent me I cut to single eyes; ten eyes made ten hills. I put barnyard manure in the hill. I dug them about Oct. 1. Number of potatoes, 195; large 165, and small 30 The large ones weighed 43¼ pounds, which I call a large yield, as they had only common cultivation and the season has been very bad for potatoes. I planted two pounds of Mammoth Pearl potatoes and had 6¼ bushels of large and one bushel of small tubers. The corn crop has proved better than we expected, on account of the warm weather in September. Potatoes above one-half a crop. Grass and rye were first-rate this year. The first frost we had here was on Oct. 5, and it froze the ground a little. We like the RURAL first-rate. The White Elephant potato alone is worth the price of the paper. E. W. C.

Michigan.

MAPLETON, Grand Traverse Co., Oct. 17.—The past season has been very dry here, though not as bad as in many other places we read of. The RURAL'S seeds all did well. I consider them well worth the price of the paper. Wheat about half a crop; oats and hay good; early-planted corn and potatoes are a light crop, but late-planted are good. Prices are: wheat, No. 1, $1.22; oats, 50c.; corn, 70c.; potatoes, 75c.; barley, 75@80c. butter, per lb.,

25c. I am very much pleased with the RURAL and the manner in which it is conducted. F.E.B.

STEVENVILLE, Berrien Co., Oct. 19.—On April 17 I planted the White Elephant Potato, weighing five ounces. I cut it into 17 pieces with one eye in a piece, and planted one piece in a hill without any manure. The potato bugs destroyed five hills when they first came up. The Summer was very dry, and the moles went through them, and then the grasshoppers hurt them badly. I dug them on October 14, and the yield weighed 36 pounds. They were all nice tubers; the heaviest hill weighed five pounds 15 ounces; the heaviest potato, one pound nine ounces. The flowers were very nice; they are in bloom yet. I think the RURAL the paper every farmer ought to have. I would not take $5 for the White Elephant Potato, and the RURAL is worth $2. A. M.

Missouri.

KANSAS CITY, Jackson Co., Oct. 14.—The seeds did not get quite a fair trial from me. The oats were given a fair and early start, but weeds and drought spoiled them. The White Elephant Potato did not do so well as the Snowflakes I planted nearly at the same time; still my medium-sized potato yielded half a peck of tubers that will do for seed next year. The Rural Branching Sorghum, I am sorry to say, did not get planted. The picotees and carnations have come up and are looking well and this Winter we hope to have fine plants in the hot-house from them. Of asparagus I will try to have good reports from next year. Western Missouri suffered a good deal from drought, but it has got too badly scared for all the hurt. Crops are not so far below the average in quantity or quality; but those compelled to feed corn and bran and millstuff generally in this section think we might as well have had a famine. As much as $20 per ton for bran has been and is being paid here by many of the dairymen, and as they don't read the RURAL, as a rule, they feed it dry alone with hay, and wonder why they can't make more money even when they have to sell their milk at 13 to 15 cents per gallon. H. W. S.

New York.

AVOCA, Steuben Co., Oct. 23.—Winter wheat proved better when harvested and thrashed than estimated in my last report; but it is still about 20 per cent. below an average; quality very good. The wet weather at the beginning of harvest did not injure it to any great extent. The price is $1.50 per bushel for the best. The Fultz, Clawson and Wicks are the leading varieties. Not as great an acreage as usual is being sown this Fall, owing to the extremely dry weather at seeding time making it difficult to plow and properly fit the ground and also preventing the seed from coming up well. The stand is small yet; but the warm, wet weather we have lately had has been very favorable for a good growth. Spring wheat is not very largely grown, and was a light crop owing to the hot, dry weather at the time of filling. Oats are a good crop, having got a good start in the Spring before the drought commenced, and as we had very favorable weather for harvesting, the crop was secured in splendid condition and as the acreage was large we have a surplus for market. They are now worth 50 cents readily. Rye was a good crop not much injured by the late drought. There was a fair acreage of it and there is a ready sale at $1, and as the straw is worth $6 per ton to bale for paper-making, the crop is a paying one. Barley showed the effects of dry, hot weather in filling; but as only a limited amount was sown the result is not as disastrous, but at the price, $1, it pays very well. Buckwheat suffered more severely from the hot, dry weather than perhaps any other grain; consequently it is a light crop, but as there was a very large acreage and the price is high—85 cents—it is of considerable importance. Potatoes are a fair crop where uninjured by blight which in many localities killed the vines long before the potatoes were mature. This was especially the case along the river flats and on low lands, while on the hills in many places they were not effected by the blight, but they were by the late drought: large quantities are now being marketed and shipped by rail at 75 to 80 cents. Corn was badly damaged by the cold, wet weather in the Spring; also by worms which necessitated plowing up many pieces and sowing to buckwheat. The dry weather late in the season prevented the ears from filling as completely as they otherwise would have done, but the warm, dry weather during the Fall caused it to mature in good order, consequently we have a fair crop—no market price for it as yet. Apples are a light crop and the warm Fall has ripened them early, while the hard winds have blown them off and they are now rotting badly. Hay was a fair crop and secured in fine order—worth $8 per ton delivered. The weather for a week has been favorable to Fall feed which will serve to lessen the demand for hay. M. A. H.

COPENHAGEN, Lewis Co., Oct. 22.—The small White Elephant Potato, weighing 2½ ounces, had ten eyes, two of which I cut into halves and planted 12 hills on May 20—soil, clay and black muck. I dug 30 pounds of good-sized tubers; the largest weighed 1½ pound; the four next, 1¼ pound each. The Washington Oats were sowed at the same time; they grew nicely; but the birds destroyed a considerable amount of them; yet I harvested three pounds. The Rural Branching Sorghum grew eight feet in hight. My wife is highly pleased with the flowers. I have taken the RURAL for 21 years. J. Y.

MECHANICVILLE, Saratoga Co., Oct., 20.—All the RURAL seeds were tested and my success with them was good, considering the season which has been dry and cold a great part of the time. The Washington Oats were sown April 23rd in rows 12 inches apart; I harvested seven quarts weighing seven pounds 12 ounces; the yield would have been much larger but the birds and chickens took about half of them. The White Elephant Potato was cut into 10 pieces and each piece was planted separately—yield 43 pounds of tubers, some very large. My success with the Rural Branching Sorghum has been different from what I have seen reported; a few seed were sown about the middle of May, from which I have obtained 55 heads of ripe seed; the rest, which were sown later, have grown 11 feet high. Some of the stalks were cut off and the second growth was 20 inches. All branched freely and it promises to be a good fodder material. The asparagus came up well, and is three feet high at present and some of the shoots three-eighths of an inch in diameter. The pinks are doing well; and have had some fine blossoms, to repay for the labor given them. In regard to the crops about here, corn and potatoes are usually light; oats good; grass, medium; rye and wheat were killed out somewhat last Winter, but wheat sown this Fall is looking well. J. H.

NASSAU, Rensselaer Co., Oct. 20.—It has been very dry in this section this season and there has not been rain enough yet to raise the water in the wells. Consequently the RURAL seeds have not done as well as might have been expected. The White Elephant Potato was cut into eight pieces and sprouted in a box. Seven of them were transferred to the garden May 14 and were dug September 15, yielding 45 tubers, 28 large-sized, 14 medium and three small, weighing 11¼ pounds. The Washington Oats grew large and stood up well until they headed, when they went down flat, and before they ripened the chickens destroyed the most of them. Of the Rural Branching Sorghum seed not one came up. The asparagus seed came up well and the plants stand from eight to ten inches high. From the flower seeds five plants matured, which were very fine. We are more than satisfied with the RURAL. F. H. H.

PATCHOGUE, Suffolk Co., Oct. 20.—The RURAL seeds did finely. I have nearly a peck of the White Elephant Potatoes and about the same quantity of Washington Oats, which I would not exchange for the price of the RURAL. B. H. S.

Ohio.

BRIDGEPORT, Belmont Co., Oct., 17.—I planted the Rural Branching Sorghum, a few seeds, in hot-beds on March 20. Three came up and grew: two of the seeds produced 31 heads of nice seed, some of them over a foot long. The rest of the sorghum I planted in the open ground on June 23, where it grew over five feet high when I cut it, after which it again grew two-and-half feet high. Some of my heads of sorghum can beat any I have yet seen reported. I planted the White Elephant Potato April 23 and dug a few nice tubers. The asparagus seed was planted April 26; I had 110 plants of the Washington Oats; the chickens destroyed about one-third but I got about seven pounds. I planted the pink seeds in a hot-bed; and transplanted them into open ground. I had over 20 different varieties. C. H. Z.

Pennsylvania.

NEWCASTLE, Lawrence Co., Oct. 22.—Wheat from 10 to 25 bushels per acre; worth $1.35 per bushel; was $1.50 per bushel last week. I sold what I had to sell at $1.50. Oats are below an average; selling at 50c. per bushel. Corn is below half a crop; worth 50c. per bushel in the ear. Potatoes, a very poor crop, $1 per bushel. From three acres I got only 160 bushels—weather too dry for potatoes. My White Elephants did not do well and there was something that ate them in the ground; the ground was all hollow in and around the hills. R. A.

WINTERBURN, Clearfield Co., Oct. 18.—We are in the midst of a drenching rain, the first good soaker we have had since June. Nearly all the crops were more or less injured by the drought, except wheat and grass which were good, the latter extra, and although there is more hay in this section than can possibly be fed this Winter, yet the drought has sent it up to $20 per ton. All other products are correspondingly high; wheat $1.50 per bushel; corn, $1; oats, 65 cents; potatoes, $1.25. Apples are plenty at a moderate price now, but they will not keep well this year. H. F. S.

Wisconsin.

DARIEN, Walworth Co., Oct., 2.—The season has been very changeable. Crops light especially corn and potatoes. Oats and barley average crops. Fruits nearly a failure. Strawberries, raspberries and grapes were average yields, and prices for them were good. Potatoes are very scarce and high—$1 per bushel. The White Elephant fills the bill. I received two small tubers with 25 eyes amongst them. They were cut to single eyes and planted in drills, May 1. They were dug Sept 1, and yielded 60 pounds, two-thirds of them were good-sized tubers. The yield would have been heavier were it not for the drought: quality No. 1. The Beauty of Hebron has excelled all others with me for earliness and quality. If any of the RURAL readers has a better potato than Hebron for Early and the Elephant for late, let him report. Z. H.

INDEPENDENCE, Trempealeau Co., Oct. 12.—The White Elephant Potato was cut into 11 pieces, having had 11 eyes, and planted one piece in a hill, on May 17, on common mucky soil, and dug October 4, after lying out in six weeks' rain: weight, 62½ pounds. They were very large—no small ones. I think they are a good potato for low, wet soil, as they do not rot. The flower seeds did not grow, except the pinks. The Rural Branching Sorghum grew seven feet high and the seeds got ripe. The Washington Oats did well. H. D. W.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

SOWING TREE SEEDS.

S. E. R., Spirit Lake, Iowa, asks how and when to plant apple, Honey Locust and Red Haw seeds.

ANS.—Apple seeds are sown in Autumn in drills, made in rich, mellow soil, and here the seedlings should remain from one to three years, according to the richness of the soil. When the seedlings are about a quarter of an inch in diameter they may be transplanted, either in the Spring or Fall, to rows one foot apart and three to four feet apart in the row. If they are thrifty they may be budded the Autumn following their transplanting. Honey Locust seed may be sown in the Fall or Spring. Some recommend scalding it a little before sowing, but too excessive heating may destroy the germ. Seed for hedge plants should be gathered from thorny trees. Haw seed is slow in germinating. The fruit is placed in a "rot-heap," where, mixed with earth, it is exposed to the weather for a year before sowing. Then it should be sown and cultivated like other hedge plants.

Miscellaneous.

J. A. Z., Wheeling, W. Va., wishing to learn all he can about farming before starting as a novice in the business, asks for the names of some good works treating on the subject.

ANS.—A really good work on farming does not exist in this country, though there are some excellent works treating of special features or branches of farming. Such works as Mason's and Johnson's Encyclopedias of Agriculture give much fuller and more valuable information about all departments of farming than any American work; but they relate to English farming, the economy of which differs in several respects from that of farming in this country. Moreover, both have been published some time, and therefore do not contain the results of recent research, and more has been learned about scientific agriculture in the last few years than in the previous few centuries. Among American works that treat of farming in general are Allen's New American Farm Book, $2.50, and Emerson's Farmers' and Planters' Encyclopedia, $6, both of which can be had through the American News Company, New York. The latest work of the sort is Farming for Profit, by John E. Reed, published by McCurdy & Co., Philadelphia, Pa., price $4.50.

J. A. B., Norfolk, Va., having seen it stated that Long Island farmers are using Paris-green on their turnips to destroy the cabbage-worm, asks whether it would be safe to so use it, and also whether it could be safely used on kale to be cut next Spring.

ANS.—We do not approve of the use of Paris-green when it comes in contact with the edible part of any fruit or vegetable which is to be used as food for man or beast. In 99 cases out of 100 probably no injury will result, nor will there, perhaps, even in 999 cases out of 1,000, but the one-hundredth or one-thousandth case in which sickness or death is produced by it, renders the thing objectionable. London-purple is less dangerous and equally effective; and pyrethrum is equally death-dealing and wholly harmless to man and beast. We should certainly never advise the use of this poison on kale or cabbage.

A. F., Bergen Point, N. J., asks, 1, whether the South side of Long Island is as well adapted to fruit culture as those counties of New Jersey that border on the Delaware River and Bay; and what section within easy distance of New York and Philadelphia markets is best adapted to fruit culture.

ANS.—Pears, peaches and small fruits thrive well on Long Island in the place named. Apples and grapes thrive only moderately well. We cannot answer the other questions trustworthily and are unwilling to state mere impressions. A personal examination of the fruits of the various sections inquired about and careful inquiry of disinterested parties living there would be best.

J. C., Homer, N. Y., sends specimens of a weed that proves troublesome thereabouts, and asks its name and how to get rid of it.

ANS.—It is Silver Weed—Potentilla Anserina. It grows on wet banks, brackish marshes, etc., in New England and south and west to Pennsylvania, as well as in the Northwest. The leaves are all from the roots or in tufts on long, slender runners like the strawberry's. We are not sure that it is a formidable pest anywhere, and it should be easily exterminated by cultivation.

F. P. N., Watson, Mich., asks where he can get Guenon's work on the "Escutcheon."

ANS.—Guenon on Milch Cows, 75 cents to be had through the American News Co., N. Y. The best work on the subject, however, was published about a year ago by J. M. Stoddart & Co., 727 Chestnut St,, Philadelphia, Pa. It is by Willis P. Hazzard. It is fully illustrated and in it Guenon's somewhat intricate and hard-to-understand system is simplified, explained and practically applied. It costs 50 cents in paper and 75 cents in cloth.

W. E. B., Stockton, Minn., asks, 1, if asparagus plants need mulching or covering this Winter; 2, will the RURAL wheats in next Distribution do to sow in the Spring; 3, will the RURAL pinks live if left out this Winter.

ANS.—1. Asparagus is a hardy plant and does not generally need covering. In your climate it might be well to cover or mulch it. 2. We have never tried sowing our wheats in Spring. We should be pleased to have you make the trial. 3. The pinks may need a little covering in your latitude, but no other extra care.

J. E. R., Good Ground, L. I., asks how to keep sweet potatoes through the Winter.

ANS.—It is difficult to keep sweet potatoes in the Winter in this latitude. A gentleman from Virginia, an extensive sweet potato grower, recently informed us that the surest way is to pack in boxes with dry sand, placing first a layer of sand then one of potatoes and so on until the box is filled.

L. H. S., Granda, Kansas, asks whether we can supply a bushel of the Rural Heavy Dent corn, and, if not where can it be had elsewhere.

ANS.—Our good friends are reminded we never sell anything. If it prove as good a kind elsewhere as at the Rural Farm, no doubt all seedmen will offer it.

C. E. S., Lairdsville, N. Y., asks when should quinces be trimmed.

ANS.—The quince needs very little pruning, an occasional thinning out of the crowded or decayed branches being sufficient. If the trees have been neglected in this respect, early Spring is a good time to remedy the neglect.

J. W. B., Union City, Pa., asks where can he get some good two-year-old mulberry trees, and about the price per 100.

ANS.—Of Thomas Meehan, Germantown, Pa. Price about 50 cents each.

L. L. S., Kankakee, Ill., asks 1, how to get rid of the morning glories that cover a lot of 10 acres, which has been plowed every year for 34 years; 2, a way to ditch without spades.

THE
RURAL NEW-YORKER,
A National Journal for Country and Suburban Homes,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 31 Park Row, New York.

SATURDAY, NOV. 5, 1881.

We beg to call special attention to the letter of Mr. R. Goodman, page 753, respecting aid for the unfortunate Michigan sufferers.

We have often spoken in high terms of the beautiful Zebra-striped Eulalia grass. If not for its odd leaves with transverse stripes of yellow; if not for its hardiness, vigorous growth and adaptation to many different soils and situations, it is at least desirable for its handsome plumes, scarcely less ornamental than those of the half-hardy Pampas Grass.

We have to-day—October 28—pulled two quinces from the new kind, Champion. They do not seem to be quite ripe, and if we were to judge of the merits of the Champion from this bit of experience, we should say there is little to recommend it over the old kinds, the Apple or Rea's Mammoth. We do not hear that much attention is being paid to the improvement of the quince.

We call attention to Mr. A. S. Stonebrakers's report of the Rural Branching Sorghum as a full corroboration of all we have ever said in its favor. It is published in this issue, page 753. It is a noteworthy fact that this sorghum, during the prevalent drought, has not wilted in the least at the Rural Farm, while beside it Indian corn has been burnt up. Even those plants which have been cut back to the ground, have continued to grow as thriftily as if they were receiving all the rain needed.

Readers of the Rural, do us the justice to believe and to remember this. Nobody can be more desirous of ascertaining the *real merits* of the seeds or plants which we distribute than the Rural itself. Our desire is to introduce *improved* varieties. As soon, therefore, as it appears that any given kind has no special value, we want to make it known just the same as if it were of the first value. We have no pecuniary interest in any seed or plant which we test, originate, disseminate or introduce. If our readers find them excellent, we are glad to have them say so; if inferior, their reports will find a place in this journal all the same.

William Watson of Brenham, Texas, tells us he has a hundred acres in peach orchard and could make a good living off his peaches alone. Last year he had an enormous crop; this year a Spring frost ruined his crops, but for the little he had he got big prices. The Alexander ripened during the second week of May, and he sold its fruit for $2.50 a peck, but could not get nearly so high a price in a good crop year. He declares that Texas is the best peach State in the Union. His land is rolling, sandy prairie. The trees grow fast and come into bearing early, but they are not long-lived. He also tells us that he has grafted the Japanese Persimmon on the common American one with good success; it takes kindly and grows rankly.

Remedy for a Cow's Barrenness.—Mr. T. C. Anderson, states in the Kentucky Live Stock Record, that he last year purchased the pure Bates cow, Seventh Duchess of Vinewood, at the Port Huron sale, for a low price, as barren. He took her to his farm at Side View, Kentucky, put her on to a grass pasture, gave her a pint of hemp seed daily, kept salt and ashes constantly by her to lick at pleasure, and she had plenty of good spring water. On the 18th of the past October, she gave birth to a deep red heifer calf of great value, got by the 23d Duke of Airdrie. Hemp seed is said to be a specific also against abortion, if given daily after the cow has gone three months, or so, with calf, continuing till about a month before calving. Working a cow in the yoke, and at the same time keeping her thin in flesh, will sometimes cause a barren cow to breed.

The Michigan Relief Fund is growing far too slowly. The Fire Relief Commission has just issued an urgent appeal for more assistance. The funds on hand will last only about three weeks longer—just to about the beginning of regular winter weather. What have the people in your neighborhood, especially the farmers, been doing to help the sufferers? Have you—yes, you who read this—sent on the price of that "Michigan Bushel" of wheat yet? If not, this is a splendid time for doing so. It would have been a trifle better to have forwarded it a month or more ago, as the price then was higher; but if it was not sent then, in all your life there will never be a better time to do this generous deed than just now. Speak to your neighbors, too, on the matter; one energetic man or woman in each neighborhood would do a world of good in helping those suffering Michigan farmers.

Five years ago, as we remember (the exact figures have been given in this journal from year to year), we planted a strong root of Paulownia imperialis in a circular bed. The growth was confined to one shoot. This grew the first season about 10 feet high, and was cut down late in the Fall. The second season's shoot grew 11 feet high; the third nine feet; the fourth eight feet; and the past season's six feet high. Other shrubs and trees in the same plot have maintained their vigor, the soil having been enriched once or twice since the Paulownia was planted. Thus it appears that the roots from this heroic treatment of the stem are becoming weakened and the evidence afforded is against severe pruning. The injury which hedges—both deciduous and evergreen—often sustain after they have grown to the desired size and fullness is often attributed to drought, to sudden changes during the Winter, or to intense cold; but it is very likely due to the severe pruning they have received during their hedge existence. We have more than once had occasion to think that apple and pear trees which have been "thinned out" to "admit the air and sun" have been seriously injured in the same way.

The Public Domain.—Judging by the amount of land taken up for settlement of late, Dakota appears to be the favorite with those who go West to grow up with the country. The area of public lands disposed of within that Territory during the last five years amounts to upwards of 8,000,000 acres. It was in 1877-78 that the rush began, the amount of land taken up that year having been six times as great as during the preceding twelvemonth. Since then the increase has been steady and rapid till in the last fiscal year 2,673,333 acres were taken up. The public lands taken up within the last five years in Kansas have also run over 8,000,000 acres, and in 1878-9 the area there disposed of was considerably larger than that mentioned for Dakota last year; but since 1879 there has been a marked falling off. During 1880-81 there has also been a considerable falling off in the acreage taken up in Nebraska, the largest area having been disposed of in 1879-80. Altogether the State has disposed of 4,226,939 acres during the last five years. California has got rid of 2,474,881 acres in the last five years, and 1,411,000 acres have been taken up in Washington Territory. In the five Southern States of Alabama, Arkansas, Florida, Louisiana and Mississippi, 1,514,000 acres were disposed of in the last fiscal year, Alabama and Arkansas supplying about one-third each. A very large amount of land was taken up in Texas, but that State contains no land belonging to the United States.

A LARGE PROSPECTIVE HORSE MARKET.

In 1877 J. A. Bridgland, our consul at Havre, with the permission of Secretary Evarts, imported some American horses with a view to selling them for the use of the French cavalry. They gave entire satisfaction and the consul has just reported that there are now upwards of 600 American horses in the French service. The enormous armies of Europe use an immense number of horses for the cavalry, artillery, commissariat and transport departments, and horses suitable for the several branches of the service are always in demand at good prices. It is estimated that there are in this country at least 3,000,000 horses suited for the European cavalry service, and the brilliant victories of the American race-horses, Iroquois and Foxhall, on the English and French turf, will help to impress the value of our stock on the minds of foreign buyers. Hitherto a great discouragement to the trade has been due to the high price charged for the transportatian of live stock by the French Trans-Atlantic Steamship Company; but new steamers are now being built both in France and England for the express purpose of engaging in the live stock trade between France and the United States, and these are sure to largely increase the traffic if managed with energy and intelligence by our horse dealers.

LATEST FEATURES OF THE RAILROAD WAR.

The era of cheap railroad fares to and from the West, has been greatly enjoyed by transient travelers on pleasure trips, and by the mercantile community (especially in this city), with whom there has been a special "boom" in business. Early last week the Pennsylvania, and Baltimore & Ohio roads had enough of the fun, and raised their rates to about the old figures. It appears that the original cause of the feud between the various lines was the difference in fares between Western points and Boston *via* New York, and Boston *via* Albany. It is about fifty miles farther from Chicago to Boston by the former route than by the latter, and the Boston and Albany company claimed that the mile rates between Boston and Albany and Boston and New York should be the same. To this the Pennsylvania, and Baltimore & Ohio roads have objected, and they claim that the fare from Chicago to Albany and to New York should be $20, and that from these points to Boston the regular rates, which differ by a dollar, should be maintained, making the through rates by way of New York $25, and by way of Albany $24. Against this the New York Central and Boston & Albany railroads pooled their issues, and the fight began. The great Vanderbilt line, last week, met the advances of its Pennsylvania neighbors by fixing the passenger rates from Chicago *via* Albany to Boston at $10.25; and *via* New York at $15; the fare from Chicago to New York being put at $9.25. We do not predict the next step, but we can speak certainly of the past. The warfare has made a great "boom" in trade; it has given unusual opportunities for cheap business and pleasure trips, and it has shown that railroad companies can live and have their being on much lower rates than they have been receiving for several years past.

"TIT FOR TAT."

"Down with the enemies of German agriculture!" was the cry at the meeting of the congress of German agriculturists the other day at Berlin, and by the "enemies of German agriculture" was primarily meant the United States of America. The constantly increasing importations of meat and breadstuffs from America to Europe, it was insisted, endanger the German production of grain and cattle and increase the existing agricultural distress in England, France and Germany. Accordingly the assembled land proprietors, speaking for the entire agricultural interests of Germany, strenuously advocated the increase of import duties upon agricultural products so as to render the tariff practically prohibitory. As a means of relief three measures were proposed: First, an increase of duties on products from this country; second, a league of the Central European States against the great grain-producing countries, Russia and the United States; and, third, better railroad facilities from the chief grain-producing regions of Central Germany and Hungary to the grain-consuming centers of the continent.

In this movement there is undoubtedly a menace, probably even a danger, to our export trade in live stock, meat and breadstuffs. It is part of a general course of opposition by European agriculturists against the free importations of farm products from this country. We are making bread and meat too cheap for the poorer classes in Europe, and the producers of these commodities there naturally resent the depreciation of prices. Statesmen, too, and financiers are becoming alarmed at the increasing drain of money to this country in payment for our agricultural exports. Bismarck is known to favor even a higher tariff than that lately imposed on foreign imports; France and a half dozen other European countries have already, on a frivolous pretext, prohibited importations of our hog products. The party of "fair trade" is still active and growing in England, and to meet this swelling tide of opposition there are two obvious courses open to this country. First, we must see to it that all our exports are strictly good. Behold what an impetus has been given to the present anti-American movement by the exportation of a little inferior pork! An embargo like that on our hog products is now being vigorously urged against our canned meats in Continental Europe, and less virulently in the United Kingdom. Shall we permit a few reckless speculators for the sake of individual gain to inflict still heavier losses on the trade of the nation by sending unwholesome food to the markets of the outside world? Second, if Germany shall adopt and France continue a policy of practical prohibition of our products, we must adopt retaliatory measures. Our people have more reason to seek protection against adulterated French wines than France has to embargo American meats on account of a few cases of trichina. To those who cry "Down with American importations," let our answer be "Protection of American citizens against foreign frauds and adulterations."

BREVITIES.

Will the winners of the prizes for the best five heads of wheat please send us their correct addresses as soon as possible!

A cotton growers' convention assembles in Atlanta, Ga., on Nov. 2, at the instigation of Commissioner Loring who has sent out invitations to all the agricultural societies in the Cotton Belt. A large attendance is expected.

There is a rumor, which appears almost too good to be true, that the British Admiralty has decided to introduce into the navy American salt beef instead of the article hitherto cured at Deptford. What a howl of indignation and protest so excellent an innovation would draw forth from John Bull both as butcher and stock-owner. "A more vexatiously irritating innovation can hardly be conceived," exclaims a London newspaper angered by the very idea of the improvement.

The composition of buckwheat has been examined by M. C. Lechartier. He found that the proportions of mineral matter in the straw increases with the weight. The straw may become richer in phosphoric acid than the grain, differing in this respect completely from the straw of the other cereals. The aggregate of the principal fertilizers removed from the soil by an entire crop of buckwheat is much more considerable than for a crop of wheat yielding the same quantity of grain.

In all the talk, East and West, about preventing and punishing gambling in the produce markets, the entire force of public condemnation seems to be directed against the "bulls" alone. Is this just? If the "bull" does occasionally toss up a commodity beyond its legitimate price as fixed by the ratio of supply and demand, does not the "bear" often pull it down below that point? The "bull" is sometimes, 'tis true, an unruly, objectionable animal to the general public, but the "bear" is always a hateful beast to the farmer, and we insist that whatever coercive or penal measures may be adopted against the one shall also apply to the other

From a very interesting table in the American Bee Journal on the honey yield for this year, we observe that the comparative order of the States as to total honey product is New York, Pennsylvania, Ohio, Michigan, Wisconsin, etc. But Dakota, though twenty-sixth on the list as to total yield, is first in the average number of pounds per colony, her average yield being 159 pounds. Wisconsin follows, a good second, with 112 pounds, and Louisiana comes third with 98 pounds. While New York takes the lead in heaviest total yield, her average per colony places her eleventh on the list. Notwithstanding the last was a very severe Winter on bees, those that survived have done good work, bringing up the average per colony in all States from 55 to 69 lbs.—nearly double. The amount of extracted honey, as compared with comb honey, is found to be much greater, showing that it is constantly growing in favor. Out of the total surplus reported, viz., 9,467,622 pounds, 5,477,176 pounds were extracted, and of this quantity 4,946,226 pounds were "light" extracted. The table was compiled from reports from less than a quarter million colonies, or about one-twelfth the whole number in America. If these reports may be taken as an average of the whole, the total honey crop for this year will not be less than 120,000,000 pounds, worth, at the least calculation, a million and a-half of dollars.

In the case of the City of Eufaula, Ala., vs. McNab the facts were these:—The city paid, in its bonds, $10,000 for land to be given to a manufacturing company as an inducement to build its works within the corporate limits, in the expectation that the business and commercial prosperity of the place would thereby be advanced. The bonds were not paid when they fell due, and thereon suit was brought and judgment given for the plaintiff. An appeal was made to the Supreme Court of the State, and the question considered was as to the power of the city to buy the land for the particular purpose stated. The bonds were issued under section 24 of the city charter which reads as follows:—"The council shall have full power and authority to purchase, and provide for the payment of the same, all such real estate and personal property as may be required for the use, convenience and improvement of the city." In deciding the case, in June last, Judge Somerville, while reversing the decree of the lower court, said that the terms of the charter are imperative that such property must be "required for the use, convenience and improvement of the city." Collateral commercial or business advantages will not be sufficient; property must not be acquired in aid of private enterprise, however laudable its purpose or useful its encouragement. This decision affects pleasantly many villages and small towns—oh, yes, and a few pretty large ones too—throughout the county, especially in the newly settled parts of it, and unpleasantly, of course, some of their luckless, confiding bond-holders.

Miscellaneous.

GRAND FORKS. D. T.

Its Location, Agricultural Surroundings and Commercial Importance.

MESSRS. HOLMES AND SWEETLAND.

[Special Correspondents of the RURAL NEW-YORKER.]

IN our last letter from this wonderfully progressive region we gave an introductory sketch of this city, promising more interesting information to follow. Upon our arrival we woro immediately impressed with the location. After visiting so many prairie towns, it is pleasing, indeed, to drop in on one which has a garnishing of natural timber, a silvery river wending its way on the east of the city, while westward as far as eye can scan, are fields just denuded of their wealth of grain.

Leading from the city the iron rails of the St. Paul, Minneapolis and Manitoba Railroad are seen trending to the South, to Fargo and the Northern Pacific; to the West to the great uncultivated tracts, to the north through the valley of the Red River to Manitoba, and to the east connecting at Crookston with the main line. A railway from this point to Duluth would be of undoubted reciprocal benefit, both as an outlet for grain and an inlet for merchandise and timber. Located midway in this great and fertile region, surrounded upon all sides by excellent lands, many of them already yielding a bountiful harvest, Grand Forks must necessarily be a center for supply and demand.

The wheat crop of Grand Forks County for 1880, was 463,160 bushels; that of 1881, 875,000 bushels, the increase being due to a larger acreage and a better average yield. The amount of wheat marketed in this city in 1880, exceeded 800,000 bushels, large quantities having been received from across the river (in Minnesota.) The receipts this year probably will not exceed those of last very largely, as several new stations have been opened north and west to keep pace with the growth of the country, although the capital and business represented by the increase of the acreage, center of necessity largely in Grand Forks and become tributary to its commercial interests. There are a few farmers who pay more than usual attention to securing a diversity of products, raising oats, barley, flax, hay and root crops; but as yet the hobby of nearly all is wheat, and the dangers of riding a hobby are well known to all farmers in older communities.

By the official census of 1880 the population of Grand Forks was 1,703; now by careful estimates it is reckoned at 2,800. There are five churches—Presbyterian, Methodist, Episcopal, Lutheran and Catholic. They have a handsome brick school building worth over $20,000; a graded school of five departments and teachers, efficient and successful. There is a good volunteer fire department. The cosmopolitan character of the people demands and sustains two English papers—the Grand Forks Herald, weekly and semi-weekly, and the Grand Forks Plain-dealer, weekly. There are also two weekly Scandinavian papers of good reputation. We were pleased to hear from the many Eastern people located here that the RURAL NEW-YORKER retains its place in their hearts and in many of their homes. Lodges of A. F. & A. M., I. O. O. F., and K. of P. are well sustained. The only indebtedness of the city consists of bonds recently voted for the erection of a city hall and jail, covering $5,000. These bear seven per cent interest and are now at three per cent premium.

The business-men of this city are active, enterprising, and busy workers; the stores well stocked and some efforts are being made to replace the wooden buildings with substantial brick structures. A Chamber of Commerce has been recently organized to protect and foster home interests. James Twombey, Secretary, will be a reliable correspondent. To give an adequate idea of the commercial importance of the place we only need to state that the commercial business (exclusive of wheat) approximates over $1,250,000. The active banking capital of the city is $150,000 with abundance of local means to co operate in enterprises. There are two steamers plying on the Red River regularly between here and Pembina, and they were built at this point. Timber in the vicinity is of excellent quality, oak predominating, and on this account it is thought by many that an agricultural implement manufactory would do well. A small three-run flouring mill is operating here night and day. The capital and enterprise of the city are agitating the subject of building a large merchant roller flouring mill to grind the staple product of the country to the tune of 75,000 to 100,000 barrels annually. People here need it, and we hope they will get it. We were told a foundry and machine shop would do well. There is now a wagon and carriage factory. A good quality of clay is quite near, and for contemplated improvements large brick yards are needed.

A word of the country and we close:—Of its soil and products we have treated. It has three rivers crossing it, their banks and valleys well timbered. The water near the river is not equal in quality to that obtainable a short distance back, which is excellent and plentiful. The bonded indebtedness of Grand Forks County is $14,000 at seven per cent, with no floating debt.

From this pen picture your readers can glean the salient points; but in no other way but by a personal visit to the places described, can their various elements of prosperity be properly appreciated.

We are frequently asked, as the easiest way of learning geography, "What is the best and most direct route to reach this Far Northwest?" The Pennsylvania R. R., to Pittsburgh; the Pittsburgh, Fort Wayne and Chicago, to Chicago; the Chicago, Milwaukee and St. Paul; or Chicago, St. Paul, Minneapolis and Omaha R. R. to St. Paul; and the St. Paul, Minneapolis and Manitoba R. R. direct to destination.

THE FREE SEED DISTRIBUTION.

WHEN we are the recipients of articles of real or supposed value, it is our duty, not only to the donor, but to ourselves, to make known the value thereof, especially where experience is necessary to gain that knowledge. The first in importance seems to be the Rural Branching Sorghum. My seed came up badly, and I got but one stalk to the hill. I planted on March 23, 3x3½ feet apart, and although but one stalk came up to the hill, it branched out to such an extent that the stalks nearly met in the rows. I cut it up about four weeks ago, except two hills for seed, and the growth around the hills is now from three to four feet high. The fodder made from that cut is eaten more readily than fodder of sugar corn. In fact, my horses eat all of it, not leaving a piece even of the stalk. I planted mine with a hoe, simply making an opening for the seed, and from that time on it never received any cultivation, even by plow or hoe. I regret to say so, but circumstances prevented it, and yet it kept on growing and never wilted, although we have had an unusually dry season, such as to burn up the corn before maturing. In conversation with the few subscribers I send you, they say their sorghum simply beats anything to grow they ever saw, and, wet or dry, it is always growing and green. It is certainly the fodder plant for the South.

I was unsuccessful with my White Elephant Potato, partly on my own account and partly owing to the weather. The vines had come up nicely when one severe freeze came—on the 13th of April—from which they never recovered. The asparagus came up well and holds its own very well. My Washington Oats proved a failure, as they nearly all smutted, which may have been owing to their being planted so late. This is one difficulty we have in succeeding with the seeds received—as it is generally too late in our climate for most of them, when received. My pinks have done finely and have given my family much pleasure. I measured one yesterday and it was 2½ inches in diameter, of a beautiful variegated color, whether a picotee or carnation I do not know, as I am not familiar enough with the pink family to tell. I had a white one that bloomed some time ago, one of the blooms measuring three inches in diameter. They are beauties, you may be sure, and I have an endless variety of colors. The subscribers I secured for you are freedmen, and they are infatuated with the RURAL. E. W. Williams told me yesterday that he would rather eat corn bread and do without meat, if necessary, to secure the RURAL. A. S. STONEBRAKER.

McLennan Co., Tex.

THE SUFFERING FARMERS OF MICHIGAN.

IT is quite gratifying to see that one *agricultural* paper has taken up in earnest the case of the poor people of Michigan who have suffered so much and will continue to unless help comes to them before Winter sets in. As in the case of the Kansas unfortunates a few years ago, the most apathetic class was *apparently* their own, the farmers, judging by the little notice taken by the agricultural papers and the gatherings at farmers' meetings. But injustice may be done by ascribing apathy and indifference to the individuals because their leaders and representatives show so little enthusiasm in the cause. Now as then, in towns and villages, East and West, collections are taken up mainly through the churches whose congregations are composed of the farming community, and if any one or two persons will start the ball it will roll into big dimensions and money, clothes and all necessaries will be gladly furnished. We have just raised here in Lenox, mainly through two churches, Episcopal and Congregational, $950 to be sent to the poor people in Michigan, and the general fund throughout the county is being daily augmented by subscriptions through the churches. But the good work must go on for some time yet if the 20,000 destitute people are to be assisted to the extent they should be. The people and farmers of Michigan have not called upon outsiders before doing what they could themselves, and they are yet striving nobly in the good work, but their appeal for assistance from other States should not be unheeded. Money is now more essential than other forms of assistance as these poor farmers have not only to be clothed, fed and housed, but put on their feet again in their vocation by being furnished with teams, seed and the other implements of their calling.

The RURAL NEW-YORKER has been among, if not the very first of influential agricultural organs at the East in making the distress of the Michigan farmers a subject of its leading articles, and if others had followed the example, the aid for the sufferers from their more fortunate brethren would have been more prompt and liberal. It is to be hoped sufficient money will soon be raised to prevent further calamities to those already very unfortunate people of Michigan. R. GOODMAN.

Lenox, Mass.

NOTES AND COMMENTS.

I REGRET to have to mention the fact that the Flemish Beauty can no longer be relied on to produce fine fruit. From several trees which I possess, there was only one that had pears worth gathering. On the others they all cracked open and were thus rendered worthless. I am informed that this cracking is becoming common in other localities. In order to obtain the fruit of this variety in perfection, it should be gathered much sooner than other pears and ripened in the house, for if it is allowed to remain on the tree it soon becomes soft and worthless. I usually gather it about the third of September even before it parts readily from the stem. The tree bears when quite small and is very productive and is of upright, luxuriant growth.

THE Jersey Gratioli is another excellent pear and is one that is deserving of more attention than is at present given it. The tree is very productive and is of vigorous growth. The medium-sized fruit is not of a very handsome exterior, the rough skin being of a greenish-yellow color covered with russet patches. It is, however, of a rich flavor and is quite juicy. It requires to be gathered about September 20, and ripened in the house.

THE St. Ghislain is also a most excellent medium sized pear with a rich, juicy, and sprightly flavor. It is also remarkably productive, producing its fruit upon the exterior branches. In season from the middle to the end of September.

I DO not think, Leon, that sowing the seed of sweet peas eight inches deep has had much to do with your neighbor's success (see page 665), but a rich deep soil, shelter, lots of water, keeping the seed pods picked off, together with a little care as to training and to furnishing supports as early as required, are all the essential requisites to the successful culture of sweet peas, and any person who will give this beautiful annual this necessary attention will be well repaid. It is to be regretted that these beautiful climbing plants are not as extensively cultivated as they should be. It may cause surprise to some of the RURAL readers, but it is, nevertheless, true that some persons have the impression that they are nothing more or less than common peas; but not only are the flowers as delightfully fragrant as mignonette, but they are of every hue from pure white to the darkest purple and deep scarlet, and some varieties are also beautifully striped. The seed can be obtained cheap in mixed packets or in separate colors as may be desired, and should be sown as early in the Spring as possible. To those who wish to obtain a few of the most distinct varieties I would recommend the following: Scarlet Invincible, a beautiful deep scarlet; Scarlet, striped white; Invincible, striped; Blue-edged, white and pink, edged with blue; Painted Lady, rose and white and brown; Princess of Prussia, bright blush.

I NOTICED that a good deal has been said of late relative to the tomato rot, and as it has caused me considerable annoyance for the past two seasons I was much pleased with the papers on the subject in the RURAL for October 1. When I first noticed the rot among my tomatoes I was inclined to the opinion that it was caused by the tomato worm, but upon the closest examination I failed to discover a single worm. As I am well acquainted with the habits of the tomato worm, and as no leaves have been destroyed on my plants, I am quite confident that it is not the tomato worm that has caused the rot in my tomatoes, and as far as my experience extends, I am of Mr. H. Stewart's opinion, that it is of fungoid origin. Mr. Stewart's paper on the subject is one of the most carefully written that I have seen as yet, and clearly shows that he has given the subject the closest examination. Now, as to the remedy—have we any? So far as I know we have none. As soon as I became satisfied that the rot was not caused by the worms, I had my plants examined daily and all imperfect, rotten and spotted fruit removed. This plan was followed daily for about two weeks. At the end of that time the rot had ceased. This plan, however, was of little avail; for about September 20, the rot appeared again and both large and small, green and ripe tomatoes began to rot rapidly. In this connection it may be well to remark that I notice that the Trophy Tomato is more subject to the rot than any other variety I have in cultivation, while the Little Gem is perfectly free from the ailment. CHARLES E. PARNELL.

HOOPES BRO. & THOMAS'S Hand-Book of Flowers. Westchester, Pa.

EIGHTH Biennial Report of the Illinois Asylum for Feeble-minded Children. C. T. Wilbur, Secretary and Superintendent.

GENERAL INDEX and Supplement to the nine reports on Insects of Missouri. By Chas. V. Riley, Entomologist to Department of Agriculture.

REPORTS OF THE CONSULS of the United States, Nos. 10 and 11, Aug. and Sept., 1881. Published by the Department of State, Washington, D. C.

STUDY OF THE VARIOUS SOURCES OF SUGAR, by Lewis S. Ware. Price 50 cents. Published by H. C. Baird & Co., 810 Walnut Street, Philadelphia, Pa.

AGRICULTURAL ADVANCEMENT IN THE UNITED STATES. An address read at the organization of the American Agricultural Association, Dec. 10, 1879, by C. V. Riley, A. M. Ph. D.

FOURTH QUARTERLY REPORT OF BUREAU OF STATISTICS for the three months ending June 30, 1881, issued by the Treasury Department from the Government Printing Office, Washington, D. C.

BIENNIAL REPORTS of the Commissioner of Arkansas Public Lands: 1st, from Oct. 1, 1874, to Sept. 30, 1876; 2nd, for two years ending Sept. 30, 1878; 3d, for two years ending Sept. 30, 1880. D. W. Lear, Little Rock, Arkansas.

HOMES FOR THE HOMELESS. This little Pamphlet of eight pages tells on what conditions the State of Arkansas offers to donate about three million acres of land to actual settlers, in tracts not to exceed 160 acres for each applicant. To be had *gratis* of D. W. Lear, Commissioner State Lands, Little Rock, Arkansas.

TENTH ANNUAL REPORT OF THE BOARD OF TRUSTEES OF THE ILLINOIS INDUSTRIAL UNIVERSITY for the two years ending August 30, 1880. This handsome work of 261 pages, octavo, besides giving a full account of the University, gives a great deal of valuable information on various farm topics in a series of papers prepared by members of the faculty and the head farmer. Among these are papers on Experiments in Corn Culture by Professor G. E. Morrow; Farm Leveling Instrument, Prof. Baker; Water for Stock, Head Farmer Lawrence; Blight of Apple and Pear Trees, Prof. Burrill; List of Native and Foreign Woods, Prof. Ricker; four papers by Prof. Weber on Contamination of Well and Cistern Water by Organic Matter; Determination of Organic Matter in River Water; Notes on Arragonite, and the Flash Test of Kerosene; two articles by Prof. Scovell on Shrinkage of Corn and Analysis of Soils of the University Farm, and an instructive article by Professors Scovell and Weber on Chemical Analysis and Practical Experiments with Sorghum Cane. We shall have occasion to refer to this work later on.

Societies, &c.

VIRGINIA STATE FAIR.

[Special report to the RURAL NEW-YORKER.]

THE 21st annual fair of the Virginia State Agricultural Society opened on the grounds of the Society, at Richmond, on Oct. 17, and closed Oct, 27. The weather throughout the entire fair was pleasant—more than can be said of the dust—and the exhibition was equal to those of former years. The officers made a mistake in attempting to hold a ten days' fair during the Yorktown Centennial, and so far as gate receipts are concerned, they have hardly realized their expectations. Exhibitors find a great deal of fault at the extra expense they are put to, and all believe that one

week is all that is necessary and profitable for any State agricultural show. Visitors on no single day numbered over 5,000, and but very few farmers were among that number. While I do not assume to know the rules and regulations of this Society, I do assume to say that if the officers expect farmers and agricultural implement men to attend their fair and become interested in its success, they must in future shut out all side-shows, "fakirs," gamblers, wheels of fortune and chariot races. Farmers do not come to an agricultural fair for the purpose of getting fleeced out of their money by sharpers, who have been plying a very profitable business here during the entire fair, having been licensed to swindle the visitors by the officers of the society.

POULTRY.—The poultry interest was unusually well represented, and the birds shown were very fine. The Messrs. Rowe, of Fredericksburg, Va., had the largest and best exhibit in this department. They showed Light Brahmas, Black Cochins, Plymouth Rocks, Houdans, Silver, Golden and White Polish, White-crested Black Polish, Colored Muscovy, Pekin and Rouen ducks, Brown China geese, Pea Fowls and Bronze turkeys, upon which they received premiums for every coop, including all sweepstakes, premiums and collection prizes. Coops were also shown by Messrs. Hollingsworth, Briscoe, Gillman and Ellison.

SHEEP.—In this department were shown some of the finest specimens of pure-bred sheep in this country. The Cotswolds, Hampshire Downs, South Downs and Merinos, as well as some fine grades, were particularly noticeable and praiseworthy. The principal exhibitors were Green & Farrer, of Orange Court House; A. P. & M. B. Rowe, of Fredericksburg, J. A. Reid & Bro., Gordonsville, Geo. Crisman, Harrisonburg; Carson & Sons, Riverton, and others, all of Virginia.

SWINE.—Mr. A. M. Bowman, of Waynesboro, exhibited nine head of very fine Berkshires; A. P. & M. B. Rowe, Fredericksburg, a fine lot of Jersey Reds, Essex and Berkshires, and F. Lovelock, Gordonsville, Jersey Reds. In this class as in the sheep department the animals exhibited were all splendid specimens and attracted much attention.

CATTLE.—In point of number not so many entries were made as in some previous years; but in point of quality no finer show was ever seen upon the grounds of the society. Fine herds of Jerseys were shown by M. B. Rowe, Roland, Buford, Green & Farrer, and G. Julian Pratt. The first premiums on two and three-year-old bulls went to M. B. Rowe and the second premium on three-year-old bulls to the same. The second premium on two-year-old bulls was won by J. S. Atlee. There were also very fine exhibits of Ayrshires, Short-horns, Devons and "native" dairy cows. Much credit is due Mr. Geo. Palmer, of Saltsville, Va., in this connection, a former resident of Syracuse, N. Y., who came into Virginia several years ago, and who has been engaged in improving the condition of stock in this State since his arrival here. His exhibit of Short-horns was the finest of its class, and particularly so was the "Duke of Onondaga,,' and "Rosebud's Oxford," each of which weighed upwards of 2,000 pounds. He also showed a yearling bull bought of A. Rennick, a famous breeder of Kentucky.

POMOLOGICAL.—The display of fruit was not large and showed unmistakable signs of the severe drought which has prevailed in this section. There were, however, a number of dishes of fine apples, and it was surprising so fine a quality could be grown in so droughty a season.

THE AGRICULTURAL IMPLEMENT DISPLAY was equal to any in former years and comprised exhibits from the principal manufacturers South and North. Mr. Ashton Starke, H. M. Smith & Co., and McGraw & Co., local dealers in agricultural implements, made fine shows, and their exhibits were very prominent features of this department. Among the leading implements deserving of special mention, are the following:

The KEMP & BURPEE MANUFACTURING COMPANY, Syracuse, N. Y., for the first time on these grounds, exhibited their combined manure spreader, pulverizer and cart. The machine was shown in full operation, and attracted large crowds. The farmers in this locality have been looking for some time for a machine that would mince up and distribute tobacco stalks. None, however, had hitherto been obtainable, and as a test of the merits of this one, it was loaded with sorghum stalks from which the juice had just been extracted. It was the severest test that could possibly be made, and all were much surprised at the thoroughly satisfactory way in which it minced and evenly distributed this load of sorghum stalks. The test convinced all of the justice of the claims put forth in its behalf, and many availed themselves of the opportunity to secure one of these machines. It sows with equal ease marl, ashes, fertilizers, wet or dry manure of all kinds, distributing the stuff with perfect uniformity, and thereby increasing the yield of grain or other crops to an extent that soon repays the cost of the machine.

THE HOOSIER DRILL COMPANY, of Richmond, Ind., exhibited one of their eight-hoed grain drills, with grass-seed and fertilizer attachments. This company commenced the manufacture of grain drills in 1857, and have steadily increased in manufacture and improvements from year to year until their patents and improvements number over eighty at the present time. Although they have a capacity of manufacturing over 10,000 drills, it has been found inadequate to meet the demands, and this year they are enlarging their works, and with increased facilities they hope to be able to meet all demands during the coming season. The simplicity and ease of operation of this drill are among its most noticeable points. The fertilizer distributor consists of a rotary plate which revolves under a square-edged casting which renders it a perfect force feed. The device for changing the quantity of seed or fertilizer consists of a changeable lever, which can be regulated while the team is in motion and does not necessitate the changing of wheels or cogs. This drill has received first premiums at nearly every fair where exhibited, and meets with general favor from all who examine its workings. The company also exhibited the Hoosier corn drill which is meeting with such wide approval. Readers of the RURAL will remember that this drill was used last season in planting the corn on the Rural Experiment Farm from which 150 bushels of shelled corn to the acre were harvested, as was stated in the Corn Number. The excellent work done by this drill contributed possibly not a little to the production of this large yield.

C. WATSON, Yanceyville, N. C., exhibited a rotary harrow which is comparatively a recent invention. All farmers who have tried it are convinced of its merits and it bids fair to take a first rank among this class of implements. Heretofore the constuction of harrows of this kind has been too complicated; the liability to become deranged from use, and the cost have prevented them from being generally employed. All these points have been overcome in the above harrow and we predict for it an extended sale. The harrow is not turned at the end of the row, and it never chokes up.

The Hoosier, Monach, Champion, Hagerstown, McSherry and Bickford & Hoffman drills were shown, all standard and worthy machines. Thrashers made by the Geiser Manufacturing Company, H. M. Smith & Co., B. Gill & Son, J. W. Cardwell & Co., were all shown in full operation. W. Deering & Co., 254 North Broad Street, Philadelphia, showed one of their string binders.

Mowers, made by Walter A. Wood, the Champion and John P. Manny were among the exhibits. Among plows, the Oliver chilled, Roland chilled, Dixie, Leader, So. Bend Watt & Call, and the Oliver and Deere Plow Sulkies attracted much attention.

Corn drills, manufactured by the Hoosier Drill Company and the Farmers' Manufacturing Company, both of which are familiar to RURAL readers, were particularly noticeable.

Corn shellers, the Cornell, Young America, the Favorite and Crescent, were each shown in operation, as also was the Whitman cob mill. Other Machines—cultivators, rakes, the Cooley Creamer, Davis and Blanchard churns, and implements of merit—were on exhibition, which space will not permit me to mention.

The fair virtually closed on Wednesday the 26th, with a grand parade, over four miles in length, of the tradesmen of Richmond. It was a "gala" day for all, and the parade was thought one of the largest of its kind ever held in the city. I would suggest to officers and stockholders that if they wish to see success crown their efforts in the future, and are desirous of making the State Fair of Virginia what it should be, they must exclude gamblers and sharpers of all sorts who openly ply their callings; and rely more upon the patronage of farmers and other decent citizens. And if the press and inhabitants of the city feel an interest in this matter, they must unite and give a hearty support to the efforts of the Society in this praiseworthy direction.

G. B. B.

NOTES.

THE Arkansas State Horticultural Society met Oct. 19th and elected officers for the ensuing year as follows:—Wm. H. Lipton, Little Rock, Pres't.; Benj. Thomas, Little Rock, 1st Vice-Pres't.; J. T. Mott, Hot Springs, 2d Vice-Pres't.; Prof. W. S. Thomas, Alexandria, 3d Vice-Pres't.; E. H. Chamberlain, Little Rock, Recording Sec'y; I. H. Nowlin, Little Rock, Corresponding Sec'y.; J. B. Hoag, Judsonia, Treas.; and Wm. F. Patton, Little Rock, Alfred Rison, Little Rock, C. C. Davidson, McAlmont, W. S. Thomas, Alexandria, Geo. W. Kennedy, Argenta, Executive Committee.

THE next meeting of the society will be held in January next, time and place to be selected by the executive committee.

A NUMBER of prominent citizens of Arkansas met at Little Rock, Oct. 19 for the purpose of forming a State Agricultural Association, and elected the following officers:—Gilbert Knapp, Little Rock, Pres't.; B. D. Williams, Little Rock, 1st Vice-Pres't.; W. H. Hunter, 2d Vice-Pres't.; J. H. Joslyn, 3d Vice-Pres't.; Peter Brigman, 4th Vice-Pres't.; Mr. Van Winkle, 5th Vice-Pres't.; Benjamin Thomas, Secretary; Thomas Fletcher, Treasurer. The society was organized on the plan of the New York State Agricultural Association and promises to be a flourishing body and to greatly promote the cause of agriculture in that State.

The Poultry Yard.

POULTRY NOTES.

In the RURAL of September 24, A. S. S. asks some questions which seem to me to demand a little more attention. The first I would refer to is, "Are the Langshans hardy and profitable?" This question should be answered most emphatically in the affirmative. I have bred them two years, and have found them extremely hardy and the very best of Winter layers. The statement that they are identical with the Black Cochins does the breeders of them an injustice. The facts of the case are these: Eight or nine years ago Major Croad was on an exploring expedition in China in the employ of the British Government. While in the Langshan district, in the northern part of China, he came across the fowl, and sent some to his home in England, where they created quite a sensation. The Langshan is distinct from the Cochin, the latter coming from the southern part of China. In shape the Langshans are more like the Brahmas, but have much longer tails, and large single combs. Their legs are black, the webs between the toes being of a pinkish color. That they are closely related to the Cochin I do not deny; nor do I deny that the Brahma is also. But I do believe that they are a distinct breed just as truly as the Dark Brahmas are distinct from the Light Brahmas. The comb of the Langshan, as I have said, is single, like that of the Cochin, but much larger.

The other question was, "Are the American Seabrights pure-bred or only a cross?" The American Seabrights (known by a variety of names, such as Excelsiors, Eurekas, Silver Laces, Hambletonians, etc.) are fowls resembling the Plymouth Rocks. They have been bred a number of years, and can as truly be called a pure breed as the Plymouth Rocks. They are, however, a cross between the Silver Spangled Hamburg and the Dark Brahma. I once saw the Dark Brahma hen through which came one of the best yards of Hambletonians. They are very hard to raise, having been bred "in-and-in" to such an extreme degree. In most yards the birds have the rose comb of the Hamburg, but some fanciers breed for the pea comb. The rose comb is the more popular and will be one of the qualifications in the new "Standard." How they came by the name of American Seabrights is a mystery, but such they are called. There has been, however, a move lately among the breeders of them to agree on the name Hambletonian. Whether it will succeed or not remains to be seen.

Both the Langshan and the Hambletonian are recognized by poultry fanciers as being pure breeds, and it is generally understood that they are to be admitted to the Standard at the coming session of the American Poultry Association.

D. C. S.

Providence, R. I.

Our correspondent seems to refer to a variety of poultry different from that of which we spoke under the name of Sebright Bantams. In the American Standard of Excellence, revised by the American Poultry Association, and published in 1879, the "points" of the Golden Sebright Bantams are given on pages 178, 179 and 180, and those of the Silver Sebright Bantams on the three following pages. It is to these we referred. The Sebright Bantam owed its origin and name to Sir John Sebright, who devoted much attention to its development some 60 years ago. There is an offshoot from it sometimes known as the American Sebright, but last Spring these were characterized in the RURAL as a poor sort not likely to be admitted to the Standard, by G. S. Josselyn, Secretary and Treasurer of the American Poultry Association, who is certainly an authority on such matters. Evidently the American Seabrights spoken of by our friend is a different sort from these American Sebright Bantams and from the Golden and Silver Sebright Bantams to which we referred.

A HINT TO SHIPPERS OF POULTRY.—As the season advances the demand for live poultry diminishes. Chickens should now be *well fattened* and shipped so soon as the weather becomes sufficiently cool, as much better prices are usually obtained than later in the season. Be very sure the animal heat is *all* out before packing. Pack in small boxes using plenty of *clean* and sweet straw. Ship to reach our market about the middle of the week.

TRANSPLANTING.

T. T. LYON.

ON page 701 of the current volume of the RURAL NEW-YORKER, an extract is published, from the catalogue of Ellwanger & Barry, of Rochester, N. Y., replete with valuable information upon this important subject,

It may be considered an act of temerity to differ, in any important respect, from what must be supposed to be the deliberate conclusions of persons so justly esteemed as high authority on subjects of this character. Nevertheless, I crave the forbearance of the editor while I call in question the sufficiency of the following directions, occuring in paragraph 3rd.

PLANTING.—"The trees, after the ground settles, should stand in this respect as they did in the nursery. Trees on dwarf stocks should stand so that *all the stock* be under the ground, and *no more*."

That the first direction is intended to apply to standard trees; that is, trees on their own roots, will, of course be readily understood. That the direction is sound, when applied to strong, dry or well drained soils I fully concede. It should not, however, be forgotten that men do frequently plant orchards upon moist and even wet soils, and especially on ground underlaid with retentive sub-soils. True, it may be said, very forcibly, that this should never be done. Admitted: and yet the fact remains that it is sometimes done. Besides, cases are not unfrequent in which trees are planted where the surface soil is but thin, with a "hard-pan" immediately below, so utterly impervious to the roots of trees that to plant them "as they stood in the nursery," would be to insure their failure with the first serious drought, especially should it occur before they shall be fully established.

In either of the cases mentioned my advice to the planter would be to set the tree directly upon the surface; or, in an extreme case, even upon a slight artificial mound; and draw good surface loam about it till the roots are buried even a little deeper than in the nursery, making the hillock very broad both at the apex and base as a security against drought. I accept the criticism, that this is not a proper way to prepare such ground for orchard planting; but the fact remains that such ground, in the condition described, is frequently planted to orchards, and, farther, that the practice is very sure to be continued. There is yet another case of very frequent occurrence, and one likely to be continued, and which undoubtedly should be continued, to which the direction in question should only apply with some modification. I refer to planting in light, dry, porous sand, such as is not unfrequently employed for this purpose in the Michigan "Peach Belt" if not elsewhere. In such soils trees are much surer if planted even two or three inches deeper than they stood in nursery, and this is often done with entire success. Indeed, I have very frequently seen fruit trees of all kinds growing thriftily, year after year, with sand drifted about them by the wind, till the roots are buried in two, three and even four feeth of earth.

Trees in soils of this character, with our trying lake breezes, especially in Spring and Autumn, need the aid of deeper planting and also of low branching to enable them to hold their position, while at the same time they are all the better prepared to withstand the droughts of Summer. Moreover, it should not be forgotten that the influence of high winds and of Summer drought increases as we go westward, and hence that the rules that apply in the planting and management of trees at the East, require modifications to meet the varied circumstances farther west.

Dismissing this part of the subject, I invite attention to the latter part of the recommendation in question—that trees or dwarf stocks should stand so that *all the stocks* be under ground, and *no more*. I recall to mind the circumstance that, many years since, the now venerable president of the American Pomological Society participated in a lengthy discussion of the question, how deep to plant dwarf pears; he urged that they should be planted with the point of union well beneath the surface so that ultimately the pear would emit roots, and thus acquire the vigor and longevity of a standard, thus combining the early fruitfulness of the dwarf, with the permaneney of a tree upon its own roots. I also well recollect my impression at the time that

Col. Wilder was confessedly the victor in the discussion, and that he was simply defending his own practice, which so far as I am aware he has not even yet changed; although he still continues to be an extensive practitioner in this direction. I will admit that a dwarf, planted as specified, may do very well as a shrub, in the garden, where a large tree would be out of place; but I cannot do away with the conviction that, for orchard planting with an eye to profit, it would prove an utter failure.

Pomological

FIRE BLIGHT--FROZEN SAP.

A. A. BENSEL.

FIRE-BLIGHT, as it is usually styled, is much more general on the pear trees of the Hudson River Valley this year than it has been for many years past, and the only remedy known, which is at best but partial, has not been applied as thoroughly as it should have been. Doubtless it seems a great sacrifice to the orchardist to have to lop off and cut away bearing branches, which last year were so thrifty and even the past Spring were so promising, but it will be found that as a general rule the more thorough the pruning the more certain the cure. Cutting far below the outward appearance of disease is necessary, because the poisonous ferment will mingle more or less with the healthy rising fluids. Much of the blight could be checked by Spring pruning or rather heading in the branches before the bursting of the buds. This, however, would only be necessary where it is suspected that the poisonous fluid remains in the tree.

I cannot agree with those who assert that the true cause of fire-blight is found in fungus growth and infusoria. The usual course of fungi is to attack old and weakened wood, while in this pear blight the most vigorous young growth is the first to give tokens of the disease. And against the theory stands the fact that no other wood of fruit or forest tree exhibits similar symptoms. Can fungus be so limited?

It is stated that fire-blight can be propagated by inoculation and this fact is given to prove the fungus theory. It would prove any other, I think, quite as well. The yellows in peach trees can also be extended in the same manner. Neither will the more active animal economy resist inoculation. The existence of infusoria in fermenting water or decaying vegetable matter is too well known to enter into the discussion as a *cause* of blight.

The remedies are not different from those which can be applied in frozen sap blight; and I am prepared by my observations the present season to affirm that the difference between the two forms of blight is only dependent upon variations of the seasons. In other words, the *frozen sap*, or more truly the fermenting sweet water, which would have become true sap under favoring circumstances, has only attained a different position in the tree economy from that which is exhibited in fire-blight. When the leaves fall capillary attraction becomes feeble, if it does not cease entirely. The rising fluid falls short of the intention of nature and does not become aerated, because the leaves have fallen—in short, is not healthy, inspissated sap at all. It remains in the small branches which are most exposed to early frosts, freezing and thawing alternately.

Fire-blight is first observed in the small branches; frozen-sap blight in blackened dead patches on the large limbs and body of the tree. However much they may agree or in whatever they may differ, the results point the pear grower to some rules which must be observed to attain success.

Where there is liability to standing water on the subsoil or hard-pan the orchard must be thoroughly underdrained. The early Spring and Summer growth is all that should be looked for or required of the pear tree. Late Summer or early Fall plowing is injurious. Even if it does not produce Fall growth the sap of the tree is excited to the injury of the buds and often to the production of blight. It should be remembered, too, that fertilizers readily assimilated are to be cautiously used on the pear tree.

By closely watching the seasons the keen observer may sometimes employ such measures as will evade both blights. Let it be remembered that "eternal vigilance is the price" of good pears.

Fruit Trees For Lawn Plants.

Horticola puts a question on p. 633 which no one could answer better than himself. But as he invites others to reply to it I will say that what rather unfits fruit trees for lawn planting is that, like other creatures, when they become producers of progeny, they lose much of the grace and attraction which once made them so "pleasant to the eye." The weight of fruit spoils the figure of the tree often beyond restoration, yet one cannot resolve to remove a tree that yields so much, doing its best so well, even when it has become an eye-sore in front, a broken-branched wreck among the neat, trim plants of ornament. Cherries, of some sorts, where they endure the seasons well, and Siberian Crabs, and the large-leafed, large-fruited variety of mulberry keep their form and luxuriance well, their fruit being small—and removed in July and August they have time to recuperate by a second growth. The mulberry—one tree is enough—is especially adapted to lawn planting, the only objection being that the daily visits of the children through its long period of bearing make that portion of the grass look sorely beaten. A grape bower is a common and highly recommendable feature of a lawn, and any of the fruits are admissible when the lawn is large and gradually merges into a sort of informal fruit yard or orchard, which can be divided off by an almost unperceptible wire fence so as to conserve the appearance of roominess and freedom. W. G. W.

For Women.

CONDUCTED BY MISS RAY CLARK.

THE CZARINA ON EDUCATION.

ALTHOUGH the late czarina regarded strict religious training as the most important element in the education of youth, over which she exercised in her adopted country a surveillance as energetic as it was benevolent, yet remarks a contemporary, she never hesitated to express her disapprobation of the narrow-minded bigotry only too prevalent in Russian schools, which tended towards developing fanatical faith in church dogmas and traditions at the expense of human sympathies and affections. Some years ago her majesty was inspecting the Smolnoje Institute for Girls, then under the direction of Madame Leontieff, a pious dame of the old orthodox pattern, whose educational views were more like those of a mediæval abbess than of a nineteenth century lady-principal. During the examination of the pupils the empress, singling out one of the elder girls, asked her, "What is love?" to which unexpected question the lady, blushing deeply, returned no answer. Madame Leontieff stepped forward, and craved permission to inform her majesty "that in her school no instruction was imparted to the pupils on this particular subject, and that in all probability the girl did not even understand the meaning of the word her majesty had deigned to pronounce." "That is much to be regretted," replied the empress, "for woman's life is naught but love—first of all, love for her parents; then love for her husband; and lastly, love for her children. If these girls have acquired no just comprehension of love, they have been very badly prepared for the duties of life." Having thus expressed herself, the empress left the institute in manifest displeasure; and a few days later Madame Leontieff received her dismissal from the Imperial Ministry of Education and Public Worship.—Young Ladies Journal.

THAT THRICE TOLD STORY AGAIN.

A. E. S., must be the wickedest of men. In a late RURAL he pities the "poor husband who comes in from his own work and is set doing his wife's." I have seen enough of the daily life of the farmer's wife to *assure* the wise and large-hearted A. E. S. that he need not waste his tender compassion on the husband. Likely the wife doesn't call on him, and more likely he'd refuse if she did, or do it unwillingly.

In general there is no animal so selfish and forgetful of his mate as the farmer in average circumstances. Every day she labors beyond her strength. Early and late and all day on her feet. That is what ails American mothers—too much on the feet!

Farmers are apt to be untender and uncouth.

Women are subject to ailments that are trying and a husband should be kind and thoughtful and thus enable his wife to endure gracefully her trials. Let him fail to be considerate and he never has her whole heart again. MRS. MARIA JENKINS.

CORRESPONDENTS' CORNER.

"A Constant Reader" who made request for information regarding the covering of slate frames, will please note the following:

To cover slate frames take a piece of flannel long enough to go completely round the slate and twice as wide as the frame. Sew the ends together, slip it on the frame and sew a plait in each corner; then put a little mucilage or glue on the frame under the flannel and place a weight on it till it is dry. The cover and frame will then adhere.

MOSS DALE.

Domestic Economy

CONDUCTED BY EMILY MAPLE.

CONCERNING THE TABLE.

MARY WAGER-FISHER.

NEITHER the best, nor the poorest domestic I ever had in my employ, succeeded in setting the table properly; at the best, there were always some essential things lacking—dishes for fruit, plates for salad, not enough cups or glasses—always something that would necessitate an additional demand. And is this not often true among mistresses, as well as maids, among farmers' daughters, even, who may regard themselves as being really quick and bright? How many of you set the table so well that when the family is seated around it for a meal, nothing is lacking? There are many, I well know, who fail to do this, and for the help of such, let me suggest that you make out a list of things to be done in setting a table, hang it up in the dining-room and read it three times a day. The list may be arranged something like this:

1. Lay the cloth neatly, with the central fold in the middle of the table, and place the caster exactly in the center, if caster is required.
2. Spoons, large and small.
3. Knives, forks and napkins in place.
4. A goblet at each place.
5. Mats for the vegetable dishes and coffee-pot.
6. Salt and pepper boxes.
7. Butter knife and butter plates.
8. Sauce dishes, cups, saucers and sugar bowl.
9. If there is to be soup, place the soup ladle and soup plates at the place of the hostess or mistress, who is to serve. Put a table, or dessert-spoon at each place, alongside the knife.
10. Where the meat platter is to be set, spread a large napkin, with the diagonal points on the central line of the table cloth. The object of this is to protect the cloth from the soiling that often comes from carving the meat. It may be removed for dessert. Put dinner plates in a pile at the host's place. Between the plates and the platter that lay the carving set, and a spoon.
11. Dessert. On a side table, or on the dining-table if there be room, arrange what is required for the dessert; plates, knives, forks or spoons, and finger bowls, where there are children about the table, and during fruit season especially, finger bowls are such a convenience, as to seem a necessity. They are far preferable to fruit napkins and in the long run much less expensive in labor and money. A child is very readily taught to clean its fingers and mouth with the aid of a finger bowl, and napkin, or eating apron, and the habit once formed is invaluable. Very fair napkins for every-day use are made of glass toweling which cost 12½ cents a yard. Another adjunct of the table, or dining-room, is tooth picks. How much they save the teeth from decay, and consequently save in dentist's bills, each one can judge for himself. They cost from 10 cents a box, up. Those of maple are strong, and cost 15 cents. The best are of orange wood—a box is supposed to hold about 2,500. Boys who are expert with the jackknife, can use that implement to very good advantage when the whittling fever is on, in the manufacture of tooth picks. There is considerably more profit in it than in setting a whole evening and whittling indefinitely over the floor, or the kitchen stove.

The caster is by no means so generally an omnipresent object on the table as formerly. A low plate, or dish of flowers, takes its place oftentimes. All floral decorations for the table are low; at least, things that obstruct the view across the table, are dispensed with.

Many untrained children long retain the habit of pushing the food on the fork, spoon, or knife with the fingers. They will very quickly take to a "pusher" for such purpose. Cut from the side of a half slice of bread a strip an inch wide, for the "pusher," and the little ones will think it great fun to use it in pushing their food on their fork, or spoon.

Of course in families where there is much work and few hands to do it, it is simply impossible to always have the table properly ordered, and many times there is not money to spare to furnish it as one would like. But it is always well to keep the table, and the habits of the table, up to the best mark feasible. Frugality should never be dispensed with. A crowded table, is, I think, very unpleasant—I would have room enough, if I could only afford a long, plain deal table, with only a muslin cover. I would rather do without the cover, than be crowded.

By the way, all persons who possess a fine cherry table should prize it. An old cherry table that has been well cared for, is as valuable as mahogany, and the older it becomes, the more valuable it is. Where the wood is very fine, well polished and free from spots, the most elegant dinner may be served upon it without a cloth. Handsome mats should be provided for the hot dishes.

One thing should never be allowed at table—the habit of putting potato skins, chicken bones, etc., on the cloth beside the plate. If the dinner plate is not large enough to hold this refuse, a small plate set between every two plates, will serve the purpose. It is much easier to wash dishes than to wash and iron table cloths well. Train the children to the most tidy habits possible at table, to regard the soiling of the cloth as an offence to be sorry and ashamed of—to keep the knife and fork on the plate and off the cloth. A well ordered table, at which cheerful amenities prevail, is worth more to the growing up family than the finest parlor that can be had.

DOMESTIC RECIPES.

HICKORY-NUT MACAROONS.

Take the meats and pound fine, add any spice you please, make frosting as for cake, and stir thick with the meats and spice. Flour the hands and make the mixture into balls the size of hickory-nuts. Place on buttered tins (allow room to spread) and bake in a quick oven.

STEWED CELERY.

Scrape and cut celery into inch lengths, cook tender, drain, pepper and salt, dish and pour over a cup of drawn butter in which has been stirred the juice of half a lemon. K. L.

QUESTIONS ANSWERED.

WAX FOR FLOORS.

Will you give recipe for a wax for polishing an oak floor, and oblige, MRS E. D.

ANS.—Take six pounds of yellow wax and cut into small pieces; then stir into a hot solution of three pounds good pearlash and rain water. (Water enough to dissolve the pearlash). Keep the mixture well stirred. After the wax is dissolved and effervescence ceases, stir in three pounds of dry, yellow ochre. Turn into tin and let harden. A pound of this mixture dissolved in four or five pints of boiling water is sufficient for the floor of a medium-sized room. Apply while hot to the floor with a paint brush. Stir the mixture frequently. If put on at night it will be dry by morning. Now polish with a large floor brush. This last requires much patience and hard rubbing. Finally go over the floor with a coarse woolen cloth.

CLEANING GRANITE TEA-POTS.

How shall I clean a granite tea-pot that has become brown on the inside?

MRS. BAUMGARTNER.

ANS.—We clean our Britannia and earthen ware tea-pot as follows: fill with a hot solution of washing-soda and water. Let stand for several hours. Then empty and rub thoroughly with a woolen cloth and sapolio. If satisfactory wash and scald, if not, repeat the process.

EGG OMELET.

Please give recipe for the above. J. E. S.

ANS.—Allow two tablespoonfuls of sweet milk and a pinch of salt for each egg. Beat the yelks until thick and creamy, add the milk and salt and last the whites beaten to a stiff froth. Pour into a hot pan in which a piece of butter the size of a walnut has just been melted. The mixture should at once begin to bubble. Slip under a broad-bladed knife frequently, to prevent burning. Cook three or four minutes and when the top begins to set, fold over, shake the pan to free the omelet and carefully turn over onto a hot platter. When a large omelet is needed it is best to divide the mixture and make two or three smaller ones, sending each to the table as soon as done.

EVAPORATED FRUIT; YEAST-CAKE AND LEMON JELLY.

No. 1. Where can evaporated fruit be obtained also Vienna yeast-cake? No. 2. I wish to know how to make jelly with lemons and gelatine. S. M. LACHLAN.

ANS.—No. 1 Evaporated fruit may be obtained of Maxfield & Co., 67 and 69 Park Place, N. Y., and Vienna Yeast cakes of Gaff, Fleishmann & Co., 153 Third Avenue N. Y. No. 2. The juice of fine and grated peel of two lemons, one package of Coxe's gelatine soaked in two coffee-cups of cold water, two coffee cups of granulated sugar, a pint and a half of boiling water. After the gelatine has soaked for two or three hours, add the lemon juice, peel and sugar, stir thoroughly, cover and leave for an hour. Then pour in the boiling water and stir until sugar and gelatine are dissolved. Strain through a flannel bag. Pour into a wet mold or glass. It will jell in from five to six hours. In warm weather set on ice.

News of the Week.

HOME NEWS.

MONDAY, Oct. 31, 1881.

AFFAIRS AT WASHINGTON.—On the 24th nst, the President nominated Ex-Governor E. D. Morgan of this State as Secretary of the Treasury in place of Mr. Windom. He was at once confirmed by the Senate, but would not accept the office. On Thursday last the name of Judge Charles J. Folger, of New York, was sent to the Senate by the President and that body confirmed Mr. Folger's appointment to the secretaryship of the Treasury. Postmaster-General James was reappointed, and was at once confirmed without reference to a committee. His nomination was made as a compliment to the efficient service he has already rendered the Post Office Department. Mr. Frank Hatton, of Iowa, was also confirmed as First Assistant Postmaster-General to succeed Mr. Tyner.

On the 25th the Senate adjourned after having confirmed most of the nominations made by the President. In the last hours of the session there was considerable fillibustering over the nomination of one Statham, to be Postmaster at Lynchburg, Va. Wilson, the present incumbent, had betrayed his trust, and Statham was named as his successor, but being recommended by Senator Mahone, whom the Southern democrats do not particularly love, he was opposed by the democrats, and by dilatory motions they prevented his confirmation. The nomination was finally laid on the table, and will be taken up in December at the regular session. The only work of importance done by the Senate in special session was the electing of David Davis as President of the Senate and *ex-officio* Vice-President of the United States, and the confirmation of the nominations to the Cabinet noted above.

Mr. Windom has resigned his position in the cabinet, and has been elected United States Senator by the Minnesota Legislature. In the Senate the vote stood Windom (Rep.), 29; Smith (Dem.), 5; scattering 4. In the House Windom 86, Smith 11, scattering 3.

Mr. Beecher resigned the editorship of the Christian Union of this city, on the 25th inst.

A terrible disaster occurred on the Mississippi river near Davenport, Iowa, on the 27th inst, whereby a steamer with about 30 persons on board was dashed to pieces against a bridge. Only eight persons were reported saved. The cam rods of the engine gave way and left the steamer to the mercy of the waves and she was hurled with violent force against the abutments. The latest report says that 18 persons have been saved.

The completed census of New Mexico Territory gives it 119,565 inhabitants, males being in excess by 9,000; 108,721 are whites and 111,000 native, showing that the native white Mexican stock is still the most important element. The increase since 1870 is only 8,000.

In the Criminal Court Messrs. Scoville and Robinson, counsel for Guiteau, made an application for the postponement of the trial of their client, and after hearing argument pro and con the Court stated that under all the circumstances in the case he would postpone the trial from November 7 to November 14. Mr. Scoville stated that in his opinion the Court had jurisdiction over the case, and intimated that he would not raise any question on that point.

An interesting ceremony took place in Union Square, this city, on the 25th. It was the presentation to the city of a handsome bronze drinking fountain, the gift of Mr. Daniel Willis James. The total hight of the work is 18 feet, and the cost $35,000. The exercises were brief and in good taste. What's the good of a fountain without water!

Four hundred and sixty-one persons were arrested during the fiscal year ending June 31, 1881, for depredations upon the United States mails. Of these 424 were prosecuted in United States Courts and 37 in courts of the several States where the arrests were made. In the United States Courts 188 were convicted, 26 were acquitted, three escaped, five forfeited bail, proceedings against 24 were dismissed, one was killed while resisting arrest, and 177 await trial.

At the Atlanta Exposition two suits of clothes—for Governor Colquitt of Georgia and Governor Bigelow of Connecticut—were made from seed cotton picked in the morning.

Walnut timber thieves, who have been overrunning the Indian Territory, have been checked by Secretary Kirkwood, who has rendered a decision that all walnut on the Indian reservations belongs to the Indians, and cannot be removed without their consent.

The New York Central Railroad Company, on the 26th, made an advance in its rates for passengers to the West. This action was due to the fact that the Pennsylvania Railroad Company a day or two previous increased its rates. The Central did not increase the prices to the same ratio as that charged by the Pennsylvania company. The Central's schedule, issued lately, is on the basis of $9.25 for Cincinnati, Chicago, Columbus, Detroit, Indianapolis, Milwaukee and Toledo; $8.25 to Cleveland, $14.25 to Quincy, Hannibal and Kansas City and $11.25 to St. Louis. These are the net prices, the rates being formed by means of a rebate from the prices based on $20 to Chicago.

At Mount Washington, N. H., on the 26th, a slight snow fell, the wind blew ninety miles per hour, and the mercury fell to 3° below zero.

Hamlin Brothers' sugar refinery, at Peoria, Ill., the largest glucose factory in the world, was totally destroyed by fire on the 27th. The loss is estimated at $500,000; insurance, $250,000. Four hundred men are thrown out of employment through the disaster.

The water in Cochituate Lake, the source of Boston's supply, is very low and badly tainted with vegetable impurities. A committee of the city Government have made an investigation with the view of deriving a supply from the branch works at Sudbury River, but found the latter also polluted. A water famine is not feared, but the danger is that pumping will have to be resorted to, in which case the supply must be reduced from 34,000,000 to 20,000,000 gallons daily.

Immigrants have been pouring into the country for the last three months at the rate of almost 2,000 a day—171,803 in 90 days. Notwithstanding the turmoil in Ireland, less than 10 per cent. of the total immigration is Irish—16,361; the English, Scotch and Welsh number nearly 30,000, the Germans, 59,000, Canadians, 19,000 and Swedes, 13,659.

Walker Blaine, oldest son of the Secretary, is reported to be a candidate for nomination to Congress in the Third District of Maine next year.

Twenty thousand people visited the cotton exposition on Thursday and enjoyed the festivities prepared for the occasion. It was Governors' Day, and there were present Governors Hoyt, of Pennsylvania; Bigelow, of Connecticut, with his full staff; Jarvis, of North Carolina; Hagood, of South Carolina, and Colquitt, of Georgia. Speeches of welcome were made by Gov. Colquitt and Director-General Kimball, and responses by each visiting Governor and other distinguished visitors. The Governors were then wined and dined at Exposition Hotel, and in the evening were the recipients of various attentions from the citizens.

President A. D. White, of Cornell University, who recently resigned the Berlin mission, has entered into bonds with the trustees of the University not to accept any political office for four years.

An old gentleman from the interior of Ohio last week presented for redemption $17,000 in six per cents. called in last July. He refused to accept a draft on the Treasurer, and insisted on being paid in gold. The coin, which weighed 75 pounds, was placed in a satchel, and the man staggered under the load as far as the Assistant Treasurer's room, where he began the task of counting the treasure. After the entire amount was carefully counted and found to be correct, the old gent was persuaded to express the coin home.

The site of the O'Leary stable, in which a $4 cow started the $200,000,000 fire at Chicago, is now occupied by a two-story brick residence with a tablet stating that the fire of 1871 started at that point and went to Lincoln Park.

About a thousand applications a day are being received for the Garfield relics. The committee has decided to prepare from the building material of the pavilion a variety of articles for which contributions will be received and applied to the monument fund.

At Reading, Pa., a cannon has been cast which will be twenty-five feet long. It is known as the Lyman Haskell gun, and the shot will be propelled by the explosion of power in four pockets as well as in the chamber. It will throw a 160-pound shot ten miles.

Guiteau's counsel, George Scoville, has secured the co-operation of Mr. A. S. Trude, a well-known lawyer in Chicago, who has had twelve or fifteen years' practice and who has high standing in the courts there. He is especially well informed in criminal law.

The Senate has confirmed the nomination of Charles W. Seaton, of New York, to be Superintendent of the Census.

President Arthur has rented the pew formerly occupied by President Madison in St. John's Episcopal Church, Washington. The church was built in 1815.

Wednesday was the closing day of the Richmond-Yorktown centennial celebration. There were 20,000 strangers there. The procession occupied two hours in passing a given point. Business was suspended. The streets were thronged. The British flag was raised on the state capitol and saluted by the Richmond howitzers.

At Napoleon, O., the trial of B. K. Scott, ex-governor of South Carolina, for the murder of young Drury at Progress, last Christmas, begun Wednesday.

The Pennsylvania Railway Company has contracted for 50,000 plants of various kinds to be delivered at the stations between Jersey City and Philadelphia. The purpose is to have flower beds at every station along the route.

The will of the late Col. E. B. Morgan of Auburn, N. Y., was probated on Saturday week. Among the public bequests are $100,000 to Wells College, Aurora, N. Y., in addition to $100,000 already given to form a Morgan fund for the college.

The remnants of the Philadelphia Centennial Exposition have been sold by auction. The great organ, which cost $20,000, went for $5,000, and it is to be removed to a Boston fair building. The largest mirror in the world, 11 by 18 feet, in one plate, originally costing $5,000, was bought by a saloon-keeper for $900.

It seems a queer arrangement of things that while the Atlantic coast has been terribly afflicted with drought the Northwest has been the victim of deluges. The cities of New York and Brooklyn are in danger of disaster from water famine, while other towns are almost inundated by the rising of the rivers. A better division of moisture between the valley of the Hudson and the valley of the Mississippi is clearly desirable. It would be strange if a region unduly parched should be called upon to subscribe to sufferers from floods.

There are 245 towns and cities in the United States having a population of 10,000 and upwards. General Walker, late Superintendent of the Census, predicts that the census of 1890 will give the United States a population of 64,467,000.

Private Secretary Brown estimates the expenses of the president's sickness at $100,000, of which $53,000 is for doctor's bills. Bliss wants $25,000, Agnew and Hamilton each $12,000, Reyburn $3,000 and Mrs. Edison $1,000. Woodward and Barnes, being government officers, may not get anything.

The new laboratory at Cornell University is to be erected in the spring, at a cost of $50,000 to $60,000. Plans are to be drawn this winter for new university buildings, which are to cost $150,000. They will be erected next year.

A MISSING LETTER.—In the report of the St. Louis fair, in the RURAL of October 22, a typographical error occurs in the description of the Barlow Planter, made by the Vandever Corn Planter Company, of Quincy, Ill. In the sentence "A distinctive feature of the planter is the rotary or revolving seed cup, by the use of which the corn is *shown* five hills in advance," *shown* was made to read *sown* by the omission of a letter.

A Strong Endorsement.

A lady residing in Georgia, whose son was threatened with consumption, wrote to several of our old patients, whose testimonials in favor of Compound-Oxygen we had published, asking if these printed testimonals were true. Among them was T. S. Arthur, the well-known author, who replied to her June 17th, 1880, as follows: "MRS. M——: In reply to your favor, I will state that the testimonial to which you refer is genuine. From what I have myself experienced and from what I know of the effect of Compound Oxygen in others, I am satisfied that this new remedy is one of remarkable curative power. Your son, I think, can hardly fail to receive benefit. Others as badly diseased, and suffering for many years, have been cured, or greatly relieved, by this Treatment, as you will see by Drs. Starkey & Palen's Report of Cases, which I am well assured are authentic." Our Treatise on Compound Oxygen, containing large reports of cases, and full information, *sent free*. Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.—*Adv.*

AGRICULTURAL NEWS.

MONDAY, Oct. 31, 1881.

THE following items of agricultural news are condensed from telegrams received in this city from various points from noon on Friday October 28, to noon to-day, October 31: Boston, Mass.—Hides higher and in good demand. Prices of wool are well sustained. Cotton has advanced 1-16c over price at close of last week.....

Providence, R. I.—Cotton market strong at 12¼c for middling uplands, and 12½c for middling gulfs. Outlook favorable for higher prices.....

Philadelphia, Pa.—Butter and cheese are very firm; fruits somewhat dull, Prices of wool are exceptionally firm.....

Cincinnati, Ohio.—Flour 15c@25c lower. Wheat and all other grains except corn are lower. Stock of hog products low. Winter packing has been begun by three houses. Leaf tobacco buoyant, with firm prices.....Dayton, Ohio.—The tobacco crop in this section is turning out finely, and prices are ranging firm and high.....Louisville, Ky.—Flour easy; grain dull; provisions fair. Leaf tobacco firmer with an advance of ¼c@½c on dark grades, and 1c@2c on burleys.....Indianapolis, Ind.—Stocks of wheat and corn in elevators are double as large as at this time last year.....Detroit, Mich.—Weather very fine. It is reported that grain rates East will be advanced 5c@10c on November 1. Grain trade moderately active.....Milwaukee, Wis.—Weather still stormy and unsettled. Considerable damage from overflows and washouts in various parts of the State. Receipts of wheat light, owing to impassible condition of roads in the interior. Flour quieter and lower owing to falling-off in demand; a number of mills are shutting down..... Chicago, Ill.—Bad roads and bad weather have a depressing effect on all trade. A better feeling in grain. The advance in freights has had the good effect of putting more cars at the service of shippers. Receipts of breadstuffs for the week are; 113,316 barrels flour; 305,886 bushels wheat; 1,401,464 bushels corn and 357,326 bushels oats. Shipments for week: 88,622 barrels flour; 170,414 bushels wheat; 2,242,435 bushels corn and 358,177 bushels oats leaving in the elevators about 3,800,000 bushels wheat; 9,500,000 bushels corn; 375,000 bushels oats and 307,400 bushels barley.....Peoria, Ill.—Hog packing houses are preparing to start winter packing..... Quincy, Ill.—This Sunday night the Mississippi River at this point is nineteen feet above low water mark, having risen slowly all day. All railroads south and west from here remain suspended, except the Hannibal and St. Joseph, which is still running. The inhabitants of the Suy Valley have moved out to the high grounds and many of them have taken refuge in this city. The water is steadily spreading over the thousands of acres of fertile farms protected by the embankment and the loss to the farmers will be very heavy. All the levees in this vicinity have been broken by the great pressure of water and the low lands are now completely flooded. This is the greatest flood ever known in this season of the year and there is no record of a higher stage at any time except during the Spring freshet in 1851. ..... St. Louis, Mo.: The freight blockade is slowly loosening. Flour very dull; local millers talking of closing down through November. Grain receipts still in excess of shipments. A downward tendency in all grains during the week. Provisions, too, extremely dull. Hogs are a full average of 20c. off during the week, owing to warm weather. Packing being done only with aid of ice. Cattle market demoralized. Receipts on Saturday, 1,200 head; shipments, 700. Horse and mule receipts small and behind demand.....Kansas City, Mo.: Weather clear and pleasant, but roads bad from late rains.....Omaha, Neb.: Rainy; travel greatly impeded. Prices of grain still high. Potatoes have fallen off 10c. owing to large shipments from Minn. Fears entertained of want of fuel during the Winter, as the supply of coal in the State is small.....Denver, Col.: Stocks of grain, flour and feed are larger than for some time back. Baled hay continues to arrive. Demand for tallow and hides still increasing. A good trade is growing with Kansas towns for Colorado produce. A carload of Colorado cabbage was lately sent to Kansas City—the first on record..... San Francisco, Cal.: Late rains starting grass and volunteer grains. Plowing is now general in many sections. Great agricultural activity owing to favorable outlook. Forty ships arrived during the week, chiefly coal laden to load grain. An Australian steamer due during the week brings $800,000 from New Zealand, the balance of trade in our favor.....Baltimore, Md: Grain from the West to the seaboard has advanced 2½c. to 5c. per 100 pounds. Cotton receipts still unusually large. Grain market moderately quiet.....Norfolk, Va: Cotton, flour and corn mills run day and night.....Wilmington, N. C.: Cotton picking is progressing favorably.....Charleston, S. C.: Turpentine still selling at 50c. Cotton receipts heavier: middling 11¼c; low middling 11c; good ordinary 10¼.....Savannah, Ga.: Collections coming in slowly from country places; and when the cotton is sold, they'll be harder to make. Cotton opened Friday morning with a strong demand and higher prices were asked and paid for middling and low middling: middling, 10⅞c; low middling, 10⅝c; good ordinary, 9½c.....Augusta, Ga.: Cotton receipts for the week in excess of last week's. Yet there is a general disposition among farmers to hold their cotton for higher prices. Collections good..... ....New Orleans, La.: Cotton firm and in good demand. Middling 11¼c; low middling, 10⅞c; good ordinary 10½c..... Memphis, Tenn.: Cotton receipts have fallen off considerably owing to bad weather, but if rainy weather continues planters will gin what cotton they have gathered, and an increase may be expected.....Nashville,

Tenn.: Corn dull and lower. Oats, hay and rye quiet; prices unchanged from last week.....Halifax, Nova Scotia: Provisions and produce still in good demand at firm prices with an upward tendency. Potatoes and apples in special demand, nearly all for foreign shipment. The potato crop throughout Nova Scotia is hardly an average one; in Prince Edward's Island it is fairly good..... Toronto, Canada: Receipts of barley comparatively small owing chiefly to wet weather—not over 15,000 bushels a day. About 200,000 bushels were shipped last week to the United States. Malsters holding back in expectation of lower prices. Owing to abundance of Fall wheat, prices for that sort are lower than for Spring. No. 2 Fall, $1.34; No. 2 Spring, $1.36 in lots.....

The Menasha (Wis.) Press says: A. Granger, Esq., of this city, uses St. Jacobs Oil on his horses with decided success and profit.

Another Important Patent Decision.

The United States Court of the Eastern District of Pennsylvania, Justice Butler presiding, has just decided that Dederick's patents on his horizontal baling press, wherein the loose material is pressed by sections into bales, are valid and protect him in the exclusive manufacture and use thereof.

Kidney Complaints

of all descriptions are relieved at once, and speedily cured by Kidney-Wort. It seems intended by nature for the cure of all diseases of the kidneys caused by weakness and debility. Druggists sell both dry and liquid. —Congregationalist.

We are strongly disposed to regard that person as the best physician who does most to alleviate human suffering. Judged from this standard, Mrs. Lydia E. Pinkham, 233 Western Ave., Lynn, Mass., is entitled to the front rank, for her Vegetable Compound is daily working wonderful cures in female diseases. Send for circular to the above address

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is enough. Price 25 and 60 cents per box.

BURNETT'S COCOAINE

Promotes a Vigorous and Healthy Growth of the Hair.

It has been used in thousands of cases where the hair was coming out, and has never failed to arrest its decay.

Use BURNETT'S FLAVORING EXTRACTS—the best.

The Markets.

SPECIALS FROM THE CHIEF CENTERS

Until Saturday, October 29.

CHICAGO.—WHEAT active, but weak; No. 2 Chicago Spring, $1.32cash and October; sales at $1.34¾@1.36¼, December; No. 3 do., $1.19; rejected, 96c.@$1. CORN active at 61½@61⅝c., cash; 61⅝c., October; 61¾c., November; 63¼@63⅜c. December.; 63⅝c., January; 61c., May; rejected, 58½c. OATS easy at 44¾c., cash; 45c., October; 44¼c., November, December and January; 47⅝@47¾c., May. FLAX-SEED easy at $1.42½@1.43. RYE easy at $1.02½. BARLEY easy at $1.06. PORK in fair demand, but unsettled, at $16.50, cash; $16.40, October; $16.37½@16.40, November; $16.50@16.55, December; $17.80, January. Lard fairly active and a shade higher at $11.40, cash and November; $11.57½@11.60, December; $11.75@$11.77½, January. Bulk-meats easier; shoulders, $7; short rib, $8.90; short clear $9.30. HOGS—market weak and prices 5@10c. lower than on Friday; mixed packing, $5.70@6.30; choice heavy, $6.40@7.00; light very slow and weak at $5.75@6; Yorkers mainly $5.95; culls and grassers, $3.70@5.40. CATTLE—market very quiet, but steady; export steers, $6.40@7; good to choice shipping, $5.40@6; common to fair dull at $4@5; butchers' steady; poor to fair cows and mixed, $2@3; good to choice, 3.50@4.20; stockers and feeders very dull and weak at $2.25@4. range cattle steady; Texans, $3@3.75; half-breeds and natives, $3.65@5; milkers and Springers, $25@52 per head. SHEEP—prices generally unchanged; inferior to fair weak at $2.80@3.25; good to choice heavy muttons, $4@5.

CINCINNATI.—WHEAT dull and declined 1c @2c since yesterday; No. 2 Red Winter, $1.42. CORN in good demand at full prices; No. 2 Mixed, 69¼c@69½c; new, in ear, 58c. OATS dull; No. 2 Mixed, 45c.@45½c. RYE in fair demand and firmer; No. 2, $1.11½. BARLEY quiet; No. 2 Fall, $1.15. PORK dull at $19. Bacon scarce and firm; shoulders, 9c; Clear Rib, 10¼c; Clear Sides, 11c. BUTTER.—Creamery is not in excessive supply, and prices of fancy are firm. Most of the off-grades have been worked off. The market closes quiet but steady. Fancy creamery sells 37@38c, prime do. at 35@36c, choice dairy at 28@30c, prime to choice Western Reserve at 27@28c, medium do. at 22@25c, prime to choice Central Ohio at 20@23c, common at 15@18c, and inferior 12@14c per lb. CHEESE.—The receipts have been liberal, but the supply of choice of mild cheese is light, and prices are firm. Prime to choice factory sells at 12½@13½c per lb. HEMP is in fair demand and firm. Rough Kentucky sell at $125.00 per ton on track. Single dressed sells at 8½@9c and double do. at 10@10½ per lb., from store. HOGS steady and firm; common and light, $4.90@$6.10; packing and butchers', $5.80@$6.40.

ST. LOUIS.—WHEAT active; No. 2 red Fall, $1.41¾, cash; $1.42¼, November; $1.45⅝, December; $1.48½ January; $1.50 February. CORN active at 62½c., cash; 63c., November; 65½c., December; 67⅝c., January; 69½c., February; 72½c., May. OATS dull at 44c., bid, cash; 50¼c. bid, May. Rye, $1.03½. PORK dull; jobbing, $17.75. Bulk-meats lower; Shoulders, $7.40; Clear Rib, $9.25; Clear Sides, $9.60. Bacon dull; nothing doing. BUTTER easier; dairy, 28@35c.; creamery, 34@38c. EGGS quiet at 18@20c.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Oct. 29, 1881.

BEANS AND PEAS.—The market is not so strong for beans as it was. Buyers seem to be holding off for a turn in their favor. This may occur in some good useful stock now coming in, but sellers express a firm future tone for the finest wants. Green peas are again lower, now quoted $1.90 for Wisconsin bbls. Southern B. E. peas quiet at $3 ₱ 2 bu. bag.

Marrow beans, prime, $3.45@3.50; fair to good, $3.25@3.35; medium, choice, $3.30@3.40. fair to good, $3.15@3.25; pea, choice, $3.15@3.20; white kidney, $3.50@3.55; red kidney, $3@3.10; oil, $2.60@2.85; turtle soup, $1.90@2.

Receipts of beans for the week, 15,540 bush.

Exports do. 125 bbls.

BUTTER.—The market is steady at slightly shaded prices for fine State dairy and creamery; Buyers have become very particular as to quality and will accept not the least imperfection in creamery when they pay the extreme. A good class of distributors are becoming a little independent of the fancy grades that have held the market so long, as good fresh Fall farm stock begins to arrive. During the week there has been some little competition for these new goods and prices have held up better than the close of last week indicated. Western butter is not much of a feature, that is, grades for table use, and they hold high prices. Common and off-quality stock is a great drug and owners have begun to try and brighten the offering by distributing it to other cities. Exports very light and there is no show of an improved outlet at the moment.

Creamery, State and Elgin, choice, 36c.; good to prime, 31@35c.; sweet cream, fresh, 32@33c.; fair to good, 28@30c.; State, June, good to prime, 26@28c.; 24@25c.; Western, choice, 31@35c.; good to prime, 30@32c.; fair to good, 28@29c.; poor, 18@28c.; June, prime, 26@27c.; fair to good, 23@25c.; State firkins, dairies, choice, 28c.; good to prime, 25@27c.; fair, 22@24c.; poor, 18@20c.; dairies, half tubs, choice, fresh, 32@33c.; good to prime, 28@30c.; fair to good, 25@28c.; Welsh tubs, choice, fresh, 31@32c.; good to prime, 27@29c.; fair to good, 24@27c.; poor to fair, 18@23c.; Western imitation creamery, 29@31c.; Western dairy, fresh, choice, 27@28c.; good to prime, 24@25c.; fair to good, 20@23c.; poor to fair, 15@20c; factory and ladle-packed, Iowa, fine June, 18c.; Ohio and Indiana, June, good, 17c.; late made, good, 16@16½c.; fair, 15@15½c.; poor, 11@14c.

Receipts for the week, 32,675 pkgs.

Exports do. 2,400 do.

CHEESE.—The market took an encouraging start early in the week but at the close the buoyant tone has subsided. The fine late made have been held to a degree that makes some accumulation of desirable lots and shippers are using the circumstance against holders. A little animation abroad will check a further decline and the outlook for very fine mild State is for above 13c. Under grade cheese close very weak; the home trade does not give much support. Skims of all kinds very dull, and good useful parts have declined.

State factory, fine, Sept. 13c.; good to prime, 11½@12c.; fair to good, 10½@11½c.; poor to fair, 9½@10½c.; Ohio factory, flat, fine mild, 12@12½c.; good to prime, 10½@11c.; fair to good, 9@10½c.; creamery, partly skimmed, choice, 9½@10½c.; poor to good, 4@8c.; fully skimmed, 2@3c.; full-skimmed factory, 1@3c.

Receipts for the week, 51,517 pkgs.

Exports do. 17,236 do.

Liverpool cable, 58s. 6d.

Steam to Liverpool, 8s. 9d.@12s. 6d.

COTTON.—It has been a tame week in this staple. Speculators have no encouraging incentives and cash buyers seemingly have no pressing wants. Prices closed fairly steady.

CURRENT PRICES FOR SPOT COTTON.

Quotations based on American standard of classification and on cotton in store, running to quality not more than half a grade above or below the grade quoted.

	Uplands.	N. Orleans and Gulf.	Texas.
Ordinary	8¾	9	9
Strict ordinary	9 5-16	9 9-16	9 9-16

STAINED.

Good ordinary	8¾	Low Middling	10 1-16
Strict good ordinary	9⅜	Middling	11 3-16

Average of futures:—

October, 11.13c.; November, 11.40c.; December, 11.66c.; January, 11.86c.; February, 12c.; March, 12.17c.; April, 12.33c.; May, 12.48c.; June, 12.50c.; July, 12.57c.. August, 12.63c.; September, 12.15c.

DRIED FRUITS.—There are no changes to note in prime lots of any variety. Unpeeled peaches, however, quoted to the extreme. The demand for small fruits is brisker than usual and the scarcity of some standard will give well cured lots a ready market.

Apples, evaporated, new, 13¾@14c.; fair to prime, 12@13c.; N. C. new, sliced, fancy, 8½@9½c.; fair to choice, 6½@8c.; Southern quarters, choice, 6@7½c.; State, old, fine-cut, choice, 7@7½c.; quarters, do. 6½@7c.; small lots, 6¼@6¾c.; Ohio and Mich. choice, 6½@7c.; Western, fair to good, 5¾@6¼c. Peaches, evaporated, peeled, old, 35@40c.; unpeeled, new, 18@20c.; N. C. peeled, fancy, 24@25c.; choice, 22@23c.; Ga. 22@23c.; Southern, peeled, fair to good, 19@20c.; unpeeled halves, N. C. 8½@9c.; halves, Tenn. 8½c.; quarters, 3¾c.; Plums, State, black, 17c.; Southern Damson, 15@15½c. Blackberries, 13c. Cherries, Southern, dry, 19@20c. Raspberries, 23@25c. Huckleberries, 15@15½c.

EGGS.—Receipts for the week, 4,583 bbls.; do. last week, 7,053 do. The demand is very good considering prices. The trade is not large but frequent calls upon a moderate stock of fresh have sustained about these quotations all the week. Lined are doing remarkably well compared with fresh.

Near points, 23@24c.; State and Pa. 26@27c.; Canadian, 25c.; Western, fresh, 25½c.; fair to good, 22½@24½c.; lined State 21@22c.; Western and County, 20½@21c.

FLOUR.—The week has been in favor of buyers, but the business has not been important, as but little wholesale trade has developed with the downward turn of prices. There seems to be a disposition on the part of operators in flour, as with many other items of spot produce, to let the market settle one way or the other, as they think that prices are now to a point that make the risk reasonable.

No. 2, $3.30@4.70; State and Western, superfine, $5.00@5.50; city mills, extra, $7.25@7.50 Spring wheat, extra, $5.40@5.85; Spring XX and XXX, $6.00@7.25; patents, $7.50@9; Ohio round hoop shipping, $5.65@6.10; trade brands, $6.25@7.00; St. Louis extra, $5.55@6.35; do. double extra, $6.50@6.85; do. family, $7.00@7.50; Southern extra shipping, $6.00@6.60; do. XX and family, $6.75@7.75. Rye flour, superfine, $5.45@6.65; buckwheat flour ₱ 100 lbs. $3.90@4.20. Corn-meal, Brandywine, ₱ bbl. $3.80@3.85; do. Western, $3.40@3.75.

Receipts of flour for the week, 120,750 bbls.; corn meal 3,250 do.

Exports of flour for the week, 37,200 bbls.; corn-meal 8,225 do.

FRESH FRUITS.—Exports of apples, 1,891 bbls. Since Jan. 1st, 215,338 do.; same time last year, 318,400 do. Prices have run up to a use-checking rate and the market is something weak. Some samples of the delicious Canadian Fameuse, or Snow Apples as they are named here, are bringing $3.75@4 ₱ bbl. Pears very dull and irregular; few barreled lots of any kind remain. Quinces are quiet, but not plenty and held firmly. Grapes in fair supply and demand; prices steady. Cranberries scarce and show an important advance. Florida oranges will be here next month. September shipments have not done well heretofore

Apples, Baldwin, State, ₱ bbl. $3@3.25; Jersey, $3@3.25; Greening, State, $3@3.25; N. Spy, do. $3@3.25; mixed lots, do. $2.75@3; King, do. $3.75@4.00; Phœnix, Jersey, $2.75@3. Pears, Sheldon, ₱ bbl. $5@6; Duchess, $3.50@5.00; Lawrence, $3@4; Vicar of Wakefield, $2.50@3.50; cooking, $2.00. Boston box pears plenty and have a wide range $1.50@4. Quinces, apple, prime to choice, ₱ bbl. $5@6; No. 2, $3@4. Grapes, Iona, State, bskts. 15 lb, 8@10c.; Catawba State, bskts, 6@7c.; Diana, State, bskts. 5@6c.; Concord, State, bskts, 2@3c.; up-river, loose, 2@4c.; Isabella, State, bskts, 2@4c. Cranberries, Cape Cod, fancy, large, ₱ bbl. $10@10.50; prime to choice, $8@9.50; good to prime, $8.50@9; poor to fair, $7@8; frosted $3.50@4.50; ₱ crate, $3@3.50; New Jersey, fancy, ₱ crate, $3@3.25; good to prime, $2.50@2.75; fair to good $2@2.25; poor to fair, $1.50@2; frosted, 75c.@$1.25.

Peanuts quiet and firm. A few extra prime new sold at 6¼c. Prices firm. Hickory nuts favoring sellers. Chestnuts moving better and a shade higher. Black walnuts shelled would probably sell at 17@18c. ₱ lb.

Peanuts, Va., hand-picked, ₱ lb, 7¼@7½c.; fancy, 6¾c.; extra prime, 6¼c.; good to prime, 5¼@6¼c. shelled, 5½@6c.; pecan nuts, 9@11c.; hickory, shell-bark, Northern, ₱ bu. $1.50@1.75; Western, $1.50@1.60; chestnuts, Southern, $3.50@4; Northern, $4.50@5.

GRAIN.—Quotations for the week are as follows:—

Wheat, Spring, $1.25@1.42; Spring No. 2, $1.39@1.41 red Winter No. 2, $1.43½@1.49; red Winter, $1.35@1.50; white Western and State, $1.35@1.45. Rye, $1.00@1.05; Oats, white No. 1, 51c.; No. 2, 51½c.; No. 3, 50c., mixed, No. 1. 48c.; No. 2, 47½c.; No. 3, 45@46½c; Corn, Western mixed, 66@67c.; No. 2, 69½@70½c.; yellow, 70@73c.; white, 73@75c. Barley, Canada No. 1, $1.17@1.30; do. bright, $1.20@1.23; State 4-rowed, $1@1.05. Buckwheat, 95@97c.

Receipts for the week, wheat, 794,750 bush.; corn, 580,325 do.; oats, 190,575 do.; rye, 53,850 do.; malt, 40,500 do.; barley, 124,500 do.

Exports for the week, wheat, 562,000 bush.; corn, 703,000 do.; oats, 3,200 do.

The visible supply of grain, comprising the stocks in granary at the principal points of accumulation at lake and Atlantic ports, and on rail, on lakes, on canal and on Mississippi River:

	1881. Oct. 22. bush.	1880. Oct. 25. bush.	1879. Oct. 25. bush.
Wheat	20,857,536	17,180,091	25,691,223
Corn	27,870,174	19,328,286	10,413,981
Oats	1,658,208	4,799,002	3,082,000
Barley	2,523,603	2,470,300	3,790,021
Rye	1,210,865	865,773	912,054

HAY AND STRAW.—Exports since Jan. '80 66,100 bales; do. last year 96,250 do. The market is in good shape. The offering is considerably reduced. There is a good demand at firm prices; straw steady.

Prime Timothy hay, ₱ 100 lbs., $1.05@1.10; medium Timothy, 85c.@$1; shipping grades, 65@70c.; clover mixed, 65@80c.; clover, 60@65 c.; Straw, long rye, 80@85c.; short rye, 55@60c. oat and wheat straw, 40@45c.

HOPS.—The Producers' Price Current says: "Receipts are very large and the tone of the market weak. Much of the stock was bought early and pays a large profit at present quotations and enough holders are willing to realize to keep the market well supplied with goods. Exporters have been in the market for strictly sound good useful hops at 20c, and have obtained a fair quantity. Brewers buy cautiously occasionally paying 28c. for a choice lot. A very few fancy samples holding at 30c. London advices are less favorable; the market quiet; highest quotation for choice American 15s.

Crop of 1881, choice, 28@—c.; good to prime, 25@27c.; fair to good 22@25c.; eastern, 20@27c.; 1880, good to prime, 18@23c.; poor to fair, 12@15c.; 1879 fair to prime, 10@15c.

Receipts for the week, 7,927 bales,

Exports for the week, 2,534 do.

MILK.—Commission opened at $2.72 ran up to $3 and closed at $2 ₱ can of 40 quarts; late supplies large.

POULTRY AND GAME.—Supplies of dressed are liberal and good quality State and Ohio give an easy tone to prices.

Turkeys, Phila. prime, 14@15c.; Jy 12@14c; State and W'n d.-p. 12½@13c.; scalded, 11@12c. Chickens, Phila. spring, 15@16c.; Bucks Co. do. 14@15c.; Jersey, do. 13@14c.; State, do. 13@13c.; Western, do. 11@12c. Fowls, Phila. dry-picked, 13@14c.; Bucks Co. 12½@13½c.; Jersey, 12@13c.; State and Western, dry-picked, 11@12c.; scalded, pr, 11@12c.; Inferior, 10@11c. Ducks, Spring, Phila. ₱ lb, 16@18c.; Jersey and Bucks Co. 15@16c.; State, 13@15c.; old, fair to good, 10@12c. Geese, Phila. dry-picked, young, 13@15c.; do. old, 10@12c.; Western, old 8@9c. Squabs, white, ₱ doz. $2.75@3; dark, $1.75@2.

Cooped stock has arrived freely and prices are easy. A good trade is now using up all prime live.

Chickens, Jersey, spring, ₱ lb. 1'@12½c.; State and Penn. 11@11½c.; Western, and Southern, 10@11c.; Fowls, Jersey, State & Penn. 11@12c.; Western and Southern, 10@11c. Roosters, old, 5@6c. Turkeys, J'y and Penn. 11@12c.; Western, 10@11c. Ducks, Jersey, extra-large, ₱ pair, $1@1.25; Jersey, New York and Penn. 65@75c.; Western, 45@55c.; Southern, 45@50c. Geese, Jersey, $1.50@1.75; N. Y. and Penn. $1.25@1.50; Western mixed $1@1.25; Southern, 75c@$1. Pigeons, large, strong birds, 30c.; young, 25@30c.

Game has arrived very freely and as the weather has not been assuring for holding; prices are generally weak.

Grouse, choice, ₱ pair $1.00@1.12; soft, 50@60c.; partridges, State & Western, $1@1.12; East'n & Minn, 75c.; soft, 50@60c.; woodcock, choice, 50@60c.; English snipe fresh-killed, ₱ doz. $1.75; plover, do. $1.50; venison, Minn. short saddles, ₱ lb. 19@20c.; Western, 17@18c; whole deer, 12@14c; wild ducks quoted $1.75 for canvassback, 50@60c. for redhead, 40@50c. for mallard, 25@40c, for teal and wood and 25c, for common ₱ pair.

PROVISIONS.—The closing remark in our flour paragraph bears upon provisions. Exporters are holding off and prices are wavering.

Pork, prime mess ₱ bbl. $17@18; extra prime, ₱ bbl. $16@16.50; Western mess new, $18. Lard, steam Western, ₱ 100 lbs., $11.70@11.80; prime city, $11.65@11.70. Hams, smoked city, ₱ lb. 13@13½c.; pickled Western and city, 11¾@12¾c.; Shoulders, smoked city, 9c.; pickled, 8c. Rib bellies, pickled, 9½@10¼c. Bacon, long clear Western, 9¼c. Beef, Western mess, ₱ bbl. $12; packet, $14; India mess, ₱ tce. $25.00@27.00. Beef hams, ₱ bbl., $21.

Receipts for the week—Beef, bbls. and tcs. 608; pork, bbls. 2,255; cut-meats, pkgs 22,300; lard, do. 18,800.

Exports for the week—Beef, bbls. and tcs. 1,361; pork bbls. 2,813; cut-meats, lbs. 4,059,694; lard do. 3,438,783.

RICE.—There is considerable inquiry for large parcels for export, but as the limits are below prevailing rates, orders have to go unfilled. Quotations are for Carolina and Louisiana, common to fair, 5¾@6¼c.; good to prime, 7@7¼c.; choice, 7¾@8c.

SEEDS.—Clover seed is in moderate request at quotation; exporters are offered lots from store at 9¾@9¼c, but make few purchases. Timothy seed is steady.

Clover, W'n, 1881 car lots on track, 9@9½c; Timothy: job lots in store, $2.85@3.25; Flaxseed, American, rough, ₱ bu. $1.50.

SUGAR.—Quotations are for:

Cut loaf, 10¼@10¾c.; crushed, 10¼@10¾c.; powdered, 10¼@c.; granulated, 9 15-16@10c.; mould A, 9¾@9¾c.; confectioners' A, 9¼@9¾c.; standard A, 9¼@9¾c.; off A, 9@9¼c.; white extra C, 8¼@8⅞c.; yellow extra C, 8¼@8¾c; C, 7¼@8c.; yellows, 7@7¼c.

TOBACCO.—Kentucky leaf is very quiet, as exporters are out of market. Seed leaf has a good demand for consumption here and abroad.

VEGETABLES.—Exports of potatoes, 1,083 bbls.; since Jan. 1 '81 867 do; same time last year 172,531 do. Receipts have piled up and the market feels the weight of them. Prices are 25c off compared weight last week. The strong market that has ruled here of late has induced the experiment of shipping European produce here. Potatoes and cabbages have arrived in a small way from England and Germany. In the opinion of the trade the stock is not down to such reduced conditions as to make room for these innovations. Sweet potatoes are doing a little better; onions tending easier.

Potatoes—Early Rose, Eastern, ₱ d.-h. bbl., $2.75@3; State, $2.50@2.75; do. bulk, ₱ bbl. $2.50; Prolific, Eastern, $2.50@2.75; Snowflake, State, d.-h. $2.50@2.75; do bulk, $2.50; Burbank, d.-h. $2.50@2.75; bulk, $2.50; Peerless, State, $2.25; sweet potatoes, Va. yellow, ₱ bbl. $3.25; Del. River, $3.50; Jersey, $2.75@3.25.

Onions, white bulk, ₱ bbl. $1; yellow, $2.50@2.75; red, $2.25@2.50; red, Chester, $2.25@2.50; red inferior, $2; tomatoes, L. I. ₱ bush. $1.25@1.50; squash, Marrow, ₱ bbl., $1.50@1.75; Hubbard, $1.75@2; cabbage, ₱ 100, $4@10; beets, L. I. ₱ bbl. $2.25@2.50; carrots, $1.50@1.75; turnips, Russia, $2.25@2.50; cauliflower, fancy, ₱ bbl. $5; average quality $3@3.50; inferior, $1@2; pumpkins, ₱ 100 $10@6; celery, ₱ doz., $1.50@2.

WOOL.—Manufacturers are again in market, and as the stock of fine fleeces is moderate and cannot be largely added to from raising points after the heavy early trade; prices are strong under a competition. The Fall clip of Californian is being marketed there; trade reported slow, as holders are looking for higher bids than are current.

X and above Ohio, 44½c.; X Ohio delaine, 49c.; unwashed and unmerchantable Ohio, 31½c.; scoured Texas, 70@75c.; Spring do. 18@25c.; Fall do. 24c.; Spring Cal. 25@36c.; Australian, 44c.; Donskoi, 31½@32c.

LIVE STOCK MARKETS.

NEW YORK, Saturday, Oct. 29, 1881.

BEEVES.—Receipts for the week, 15,839 head; do. last week, 17,101 do. The closing market compares well with Wednesday's sales. Cattle arrived late, and for that reason stock sold a little lower than it would, as butchers were in large attendance, all wanting stock. Texans sold at 7½@7¾c. to dress 55 lbs.; Colorados at 8@8¼c.; common to choice natives 8c. to dress 55 lbs. to 12¼c. to dress 57 lbs., with some rough oxen down to 7½c. to dress 55 lbs.

VEAL CALVES.—A number of good selling weeks have attended veal calves and the market again closes steady.

Live calves, N. J. choice, 9½c.; do. State, prime to choice, 9½c.; fair to good, 8½@9c.; poor to fair, 6@8c.; Mount Hollys, 7@9½c.; buttermilks, 3½@4c.; grassers, 3@3½c.; hog-dressed up-river, 12@14c.

SHEEP AND LAMBS.—Receipts for the week, 40,337 head; do. last week, 42,275 do. Good sheep were scarce and brought full late prices. Lambs were in liberal supply, and with a good many reported on the road the feeling was very weak and a reduction of ½c. per pound is reported on all grades. A car-load of choice wethers sold at 5c. but most of the sales of heep were at 3½@5¼c; lambs ranged from 5c. to 6¾c

SWINE.—Receipts for the week, 32,781 head; do. last week, 35,324 do. At the close prime corn hogs seldom exceed $6.40 ₱ 100 lbs.

New Jersey pork, light, 9@9½c.; other weights, 8@9c.; city dressed, 8¼@8¾c. Pork tenderloins, 14c.; beef do. 17c.

Terms for 1881.

Root Crops.

THE next crops in importance to grass and grain are roots. With these, potatoes are generally included, although these are not roots, but tuberous enlargements of underground stems. Besides potatoes there are usually grown turnips, rutabagas, mangels, beets, carrots and parsnips. Turnips are related to the cabbage tribe of plants; rutabagas are a species of turnip, brought from Sweden and Russia, and sometimes called Swede turnips; mangels are a species of beet, but not so sweet as the sugar beet. This root is largely cultivated in Europe for making sugar, and the French and Germans procure all their sugar and molasses from it. It is grown for the same purpose to a small extent in America, but it does not seem to become so profitable as our more cheaply-grown Southern sugar cane. Carrots and parsnips are not often grown as field crops, except in market farms and gardens; but their great value for feeding render them a very desirable crop for farm culture.

Only good farmers grow roots in large quantities, because they require rich soil, plenty of manure and ground free from weeds, which would choke the plants when young and small and prevent their growth. But a good crop of roots supplies a larger amount of fodder than any other crop that can be grown. A yield of 30 or 40 tons of turnips or mangels per acre is by no means unusual with farmers who know how to grow them; and 30 tons or 60,600 pounds per acre, would furnish one cow or ox with 60 pounds per day for 1,000 days or nearly three years. No other crop that is grown will support an animal for this long period of time.

As roots are usually fed in the Winter when the other feed is dry, the fresh, juicy roots are then very acceptable to the stock and serve to keep them in the best of health, when, without them, the dry feed would not be so healthful. On this account mangels and beets are grown for feeding cows for the dairy in the Winter, and turnips and rutabagas are grown for feeding to sheep and oxen, or to beeves that are fattening for the butcher. The latter are not desired for dairy cows because they possess a strong flavor and give a disagreeable taste to the milk and butter.

Roots are grown in drills, usually 24 to 30 inches apart, so as to permit them to be kept clean with the cultivator or the horse-hoe. The seed is sown in the drills either by hand or with a machine made for the purpose, and much thicker than is actually needed for the plants to grow. This is done to get a good stand; or a sufficient number of plants so close together in the drills that the surplus may be cut out with a hoe and leave a regular row of plants at even distances apart, and from eight to twelve inches. If the seed were sown only at this distance apart some would fail to grow, others would be destroyed by flies or cutworms or grubs and then there would be many vacant spaces which would greatly lessen the yield. For this reason several times as much seed is sown as would really be required, but the cost of the seed is of small account as compared with the value of a full crop. Of mangel seed, about six pounds per acre is sown; of sugar beets, about 12 pounds; of turnips, about four pounds; of rutabagas, about four pounds, and of carrots about two or three pounds. Mangels and beets are sown the earliest; usually early in May; carrots are sown in May or June; rutabagas in June or early in July; and turnips in August. The reasons for this variation in time of sowing are that mangels and beets are tender and require the Summer heat of the sun to force their growth; while turnips are not injured by light frosts and thrive better in the cool Fall weather than in the hot Summer; besides the turnip is a rapid growing plant and if sown in May or June it would become too old and perhaps run to seed before Fall; and this would destroy the value of the root for feeding.

THE HORTICULTURAL CLUB.

SECOND DISCUSSION.

Topic:—Orchard Fruits; Their Management for Winter Use, Best Varieties, etc.

THE second meeting was called to order by the Chairman—Uncle Mark. He said the importance of the question about to be discussed could not well be overestimated. It is not enough to have apples, plums and pears, but we should have the *best* varieties of them, such as will taste, look and keep the best. We want not only the best varieties, but we should know how to keep them so that we may enjoy them, even the year around. Nothing is healthier at any season of the year than good, sound, ripe fruit, and this is especially true at the Spring season. While there are some apples, such as the Golden Russet, which has good keeping qualities of its own, proper care in packing, and keeping in a temperature just above the freezing point, will enable us to keep almost any good Winter varieties much longer than we commonly do. For late Winter use the Baldwin, Golden Russet, Belmont, Ben Davis and Danver's Winter Sweet apples may be recommended.

NELLIE MCINTYRE—Of our varieties I consider the Wagener the best. For Winter use we prefer the Baldwin, Spitzenburg, Ben Davis and English Russet. Apples should be carefully picked and put in the cellar on shallow box-shelves, where they may be easily assorted.

HENRY WELFARE—Apples should be packed in barrels or laid on shelves in the cellar. The more leaves the better. The Snow Apple did as well with us, this year, as any. The Russet and Seek-no-further keep best here in Michigan.

ROSY BENTON—Orchard fruits are unknown to many of us children on the Western prairies, except as we get them in the market. My brother Andrew wonders what those cousins living in a world of fruit would think to buy apples in the market and find, on opening the barrels, that the first two layers were large, perfect apples and all the others small, imperfect ones. That's the way we find them sometimes.

THE CHAIRMAN—The deception just mentioned is, I am sorry to say, too commonly practiced. Just to make apples sell well some dishonest men resort to mean tricks. I hope none of the Club will ever think of doing such a thing. Honesty, in everything, is the best policy, and those who deceive others in packing fruit will, I hope, realize the fact. If they are once found out nobody will buy of them the second time, and while they may get a good price for one lot, they may get a very poor one or none at all after their way of doing business is known.

NELLIE BALDWIN—We do not grow very large apples in this part of Minnesota, but among the best are the Wealthy, Minnesota, Tetofsky and Duchess of Oldenburg. We have excellent varieties of crab apples, such as Early Strawberry, Orange, Whitney's No. 20 and Transcendent. The last is subject to the blight after a dozen years or so, but it it very fruitful and pays well before the disease affects it. Our plums are the wild varieties, some of which are very fine and large.

W. J. MASON—About eight years ago I picked some wild plums and planted the stones. When the little trees came up I took good care of them, and now I have plums that are as much superior to wild plums as a peach is superior to wild grapes. They are very large and sweet. Worms make their nests in our trees in the Spring, but I soon clean them out by applying a kerosene torch.

W. D. HERRICK—No farmer should be without orchard fruits. Of apples for Summer use I think Early Harvest and Strawberry are the best; for Autumn, the Pippin and Maiden's Blush; for Winter, Ben Davis, Golden Russet, Baldwin and Talman's Sweet.

WILLIE PRESTON—We raise a great many pears and plums. Among the former we prefer Beurre d'Anjou, Brandywine, Bloodgood, Seckel and Bartlett, and among the latter the Early Green Gage, Golden Gage, Isabella and Miner are good varieties.

FRANKIE LEWIS—I would like to ask the Club if packing apples in sand or in cut straw is better than the old method with barrels and boxes simply.

THE CHAIRMAN—It is decidedly better. Sand-packing is to be commended. Fruit will keep longer and fresher than in any other way. The apples thus preserved lose less water by evaporation, are very free from moldiness, and when one happens to decay it does not easily affect the others. Straw-packing, while it may preserve the fruit as well, is quite apt to give it a musty taste if the straw gets damp. There is but little advantage in wrapping apples in tissue paper, since, if the cellar is damp, mold will develop itself on the paper. Good authorities recommend storing in dark, damp cellars.

JOHN MORRIS—The great secret in keeping apples in the Winter is in first packing only the perfectly sound fruit. Bruised fruit will soon decay and impart disease to that adjacent. The practice of pouring apples, unassorted, from the picker's basket into the barrel in which it is to remain is to be deprecated.

THE CHAIRMAN—I am glad to notice an increased interest in these discussions. The topic for December 3 will be "Winter Flowers for the Parlor: how and what to propagate."

A PROPOSITION.

"ALL WORK and no play makes Jack a dull boy," but it is no worse than all play and no work, if it is as bad; in fact, I'd rather raise my little ones on the work. I think they would be more apt to make good men and women, yet I love to see them play and hear them laugh, for

> "The laugh of a child, so wild and so free,
> Is the merriest sound on the earth to me;"

and no child better enjoys a romp and play than the one who has learned his lessons well, or finished any task.

I am much interested in your Horticultural Club; hope you will take good care of your gardens, and share your surplus with those who have not your advantages. Now if Uncle Mark will not let me join because I'm a woman, perhaps he will let me get things from you and at the same time help you. I do all kinds of hair-work—make switches, curls, watch-chains and flowers of hair. I will make these, or show how it is done, and let you pay me in choice lilies, roses, grape-vines, raspberry or strawberry plants or other plants that I have not, if you furnish hair material. Many little girls would like to learn, and if they will write what they have to spare, and the price they wish, I will answer, if we can make a bargain. Plants must be well packed in damp moss or paper. Some years ago I gathered a large lot of flower seed and sent all over the United States to poor little girls who were not able to buy, and I've never had more satisfaction than in the reading of their humbly thankful letters. But now I have three little ones of my own who want to have flowers and fruits, and they want to know how to to help raise them as soon as they are large enough. MAGGIE WOOLMAN THOMAS.

Kent, Union Co., Iowa.

A PLEA FOR THE CHILDREN.

"PLEASE, papa, can't I go?"

"I wish you would quit bothering me about going to school. They say Tom Hawkins is obliged to sell his farm this Fall, and it will be sure to go cheap, for he's let it go down till I'm ashamed to have it adjoining mine; and what a nice thing it will be to have this farm and that all together."

"But, papa, I'd like so well to go."

"Didn't I tell you that I want to save enough to buy that other farm?" said Josiah Clover to his daughter Nellie, who wished to attend a select school.

I sat in the next room sewing, and thinking how I had heard sister Della coaxing father for the same luxury which her daughter Nellie was pleading for, and I can hear the answer yet, almost as if I had just heard it uttered. "For mercy's sake stop your bothering me about going to school; stay here and mind your own business," said father. And as she grew up to be a young woman how often I could hear her sobbing after having cried herself almost to sleep.

A few years after, Jo. Clover took our little girl to help him build a home. Six years later we saw the sod closing over her grave. Baby Nellie was motherless—another victim to overwork had gone to rest. Many times did father tell me that he wished he had let his darling go to school. I don't believe she ever got over that rough answer.

Now I dare say I have seen as much of this world as many of your readers, and I shall always insist on giving the children a chance to go to school, if they want to.

AUNT MOLLIE.

NOTES.

THE Cousins will doubtless be glad to see the report of the meeting of the club in this issue. I am more and more impressed that *we*, not I, can make this of much interest, if we are so disposed. For our next discussion which will occur in four weeks, a subject on flowers for the Winter has been chosen, and I hope that the nieces especially will take up the subject in a lively manner; they will have to or the nephews will out-do them. However, the young ladies have done well this week. Now, let's see who says the best things about the next topic, the boys or the girls. If you don't know much about the culture of house plants, ask your mother or aunt or cousin about them. Enlist them all in your service, then send to the RURAL your best opinions. In that way our discussions will be interesting. My roll of members is increasing wonderfully and bids fair to be a much longer one than the former. We want every wide-awake boy and girl in the RURAL family to join us. We should like to hear what the Cousins think about our "Discussions."

New Members of the Club for Week Ending Oct. 29.

PERSONALS.

Horatio Seymour, Jr., of New York, expects to move to Michigan to take charge of extensive landed interests.

Walt Whitman has been invited to pay a visit to Mr. Swinburne, the poet, and will leave for Europe in a few months.

The late Governor Wiltz, of Louisiana, left his widow and five children in poverty, and a committee of leading citizens has appealed to the people of the State to provide a fund for them.

Mr. Gladstone gives this account of himself: "By blood I am a Scotchman; I am by residence a Londoner; I am by marriage a Welshman; and I am by birth a Lancashire man."

S. D. McEnery, who, by the death of Governor Wiltz, has become Governor of Louisiana, is fifty-four years of age. He is a man of fine address, exceedingly popular, and is opposed to rings and ring legislation.

Stock.

Cheshires a Specialty.

Tea & Coffee.

We have made a specialty for the past *five years* of giving away as Premiums to those who get up Clubs for our goods, *White Tea Sets, Gold Band Tea Sets, Dinner Sets, Silver Plated Ware, &c,* Our goods are warranted equal to any in the country. Full line of every kind and variety. Send postal for Price and Premium List, and mention Rural New-Yorker.

GREAT LONDON TEA CO.,

801 Washington Street,

Boston, Mass.

CARPETS.

AT RETAIL

By the Manufacturers.

We have now open an immense stock of Carpetings, including full lines of all the New Fall Patterns and Styles.

Being the product of our own factories, we warrant every Carpet as represented, and full satisfaction is guaranteed or the money refunded.

Axminster Carpets—We offer 300 pieces of these desirable goods at **$1.75** per yard, the same quality as sold last season at **$2.75.**

French Axminsters—A full line of our own importation at **$1.65** per yard.

American Moquette Carpets—400 pieces at **$1.40** per yard—the cheapest carpets ever offered. These goods cannot be found elsewhere in the city at anywhere near the price.

Velvet Carpets—The largest and best stock of Velvet Carpets in the United States at **$1.50** and **$1,60.** Extra good value.

Body Brussels—Best quality, full five frame, at **$1.25** per yard, special patterns at **$1.40** and **$1.50.**

Tapestry Brussels—A very large assortment of popular patterns at **75 cts.** per yard—same goods as sold elsewhere at **90 cts.** Finer grades at **90 cts.** and **$1.05.** A splendid assortment.

Ingrains—Extra superior quality—a very full line from **75 cts.** to **90 cts.** Also a good line of all wool ingrains from **65 cts.** to **75 cts.** yer yard.

Persia and **India Rugs** and **Mats** of our own importation, a large assortment at low prices.

J. & J. DOBSON,

40 and 42 WEST 14th ST., NEW YORK.

John Van Gaasbeek, Manager.

A GOOD SAW MILL

For $200.

Our No. 1 Plantation Saw Mill is designed to be run by 8, 10 or 12 horse-power Agricultural Engines. With this power from

1,500 to 4,000 Feet

of lumber can be cut in a day—a product 25 to 50 per cent. greater than can be cut with any reciprocating saw mill with the same power. The mills are complete except saw, and will be put on the cars in Cincinnati for the low price of $200, and warranted in every particular. Saw Mills of all sizes. Engines and Boilers, Shafting, Gearing, etc. Illustrated circulars sent free.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME.

Ralph Evans

VOL. XL. No. 1659.} NEW YORK, NOV. 12, 1881. {PRICE FIVE CENTS $2.00 PER YEAR

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

The Herdsman.

OUR ANIMAL PORTRAITS.

Dutch-Friesian Cow, Sjoerd.

THE SUCCESS that attends the introduction to general notice of a breed of cattle or other domestic animals, that has previously been prized only within a limited area, depends very largely, at the outset, upon the skill with which the introduction is effected. It is a trifle doubtful whether the Short-horns would have stepped to the foremost place in the front rank of neat cattle so rapidly had not special attention been called to the fattening capacity of the breed by the peregrinations of the enormous "White Heifer that Traveled," just at the time when the labors of the two Collings and of the other early breeders of the race were bringing to general notice the fine qualities of the choicest developments of the cattle formerly highly valued locally along the banks of the Tees. The "Heifer's" wanderings quickly attracted wide attention to the great merits of the breed to which she belonged, and a few years won for these merits a general recognition which it might otherwise have taken as many decades to obtain. To secure rapid popularity, and consequently high appreciation and high prices for any breed of stock, not only are great merits necessary, but skill and enterprise are also essential in bringing these to the favorable notice of the people.

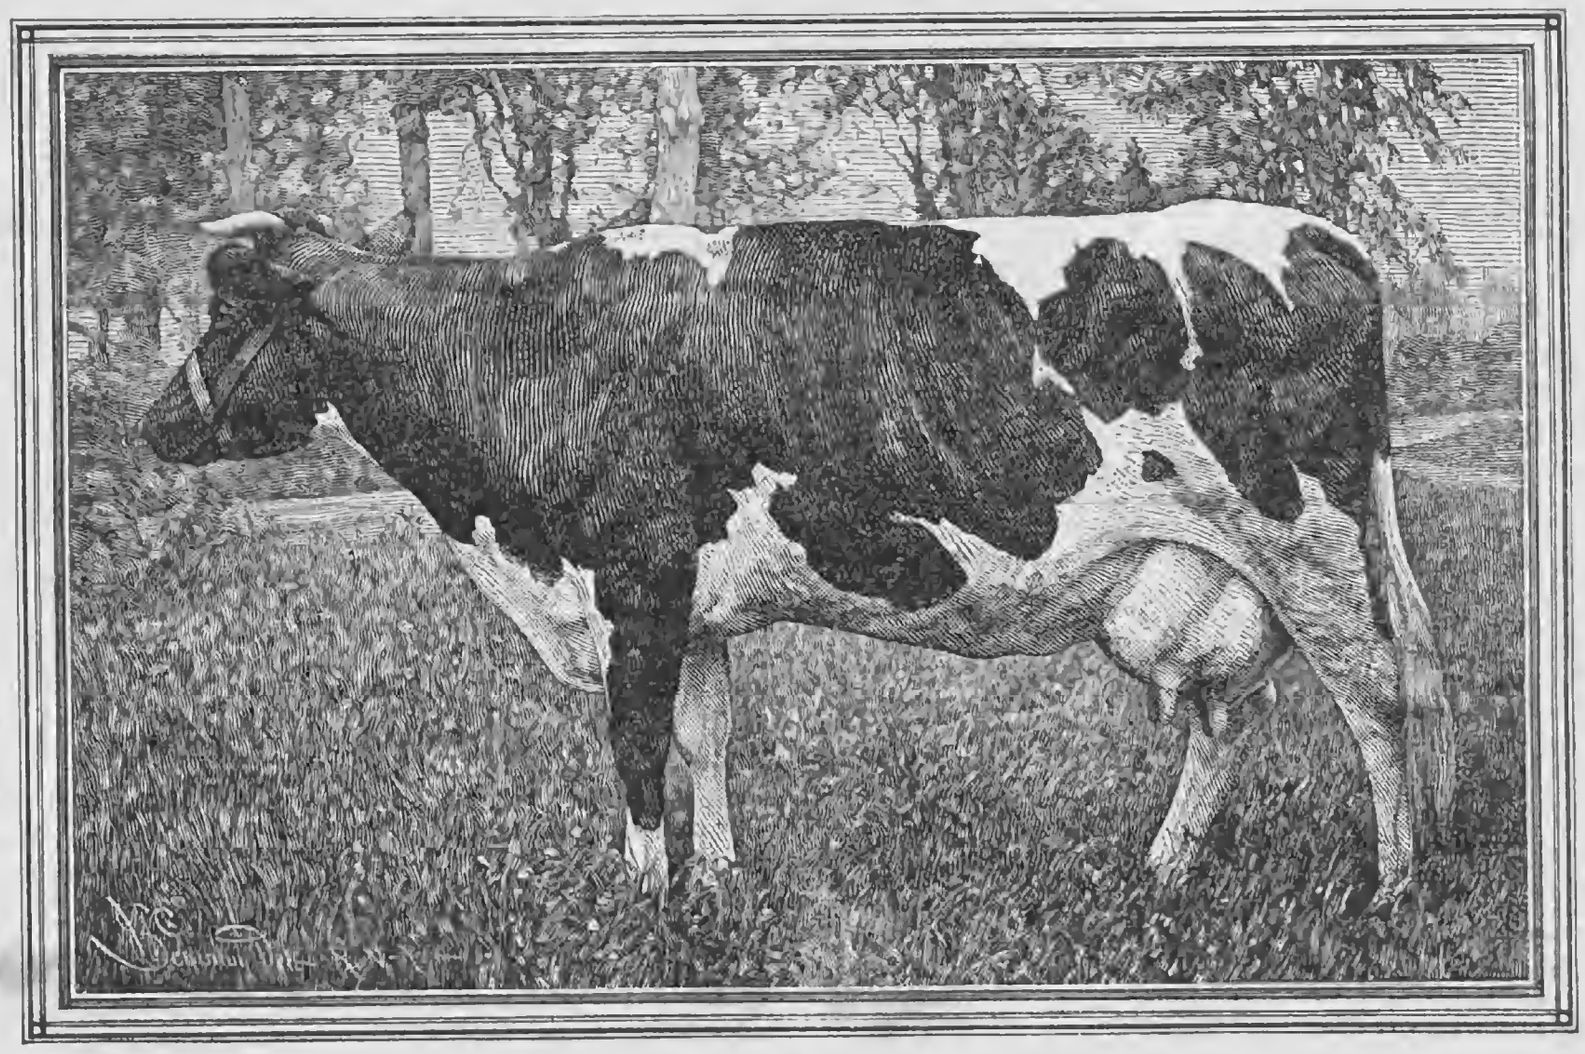
The visitor to English agricultural shows and cattle fairs, or the reader of English agricultural papers, cannot fail to notice the frequent appearance of the same herds or single animals at the chief exhibitions in different parts of the country. Within the narrow boundaries of England this is a matter of comparatively little difficulty or outlay, but in this country, where vast distances intervene between the points at which our chief agricultural fairs are held, to incur the trouble and expense necessary to make such frequent appearances speaks well for the spirit and enterprise of the exhibitor, and for his high opinion of the excellence of his exhibit.

The Unadilla Valley Stock Breeders' Association has lately successfully accomplished such a venture, Mr. Langworthy, their agent, having just returned from exhibiting a herd of 12 choice Dutch-Friesian cattle at the four leading Western fairs. At the Minnesota State fair, at Minneapolis, they were awarded six first and three second premiums, including the first and second prizes in the Holstein class, and the first herd prize in the sweepstakes class, composed of all the dairy breeds, six herds competing for the Holstein and twelve for the sweepstakes dairy premium. After this the herd was divided, five animals going to the Northern Wisconsin fair and seven to the Chicago fair. At the latter they were awarded five first prizes and one second, including the sweepstakes in the class Holsteins, for which five herds competed. At the Illinois State fair, at Peoria, the herd was reunited and carried off eight first and two second premiums, including the sweepstakes for dairy breeds, for which 13 herds competed. Finally, at the St. Louis fair, the last they attended, they were awarded nine first and four second premiums, including the first and second herd prizes in class Holsteins, and the sweepstakes on single bull and on single cow. Altogether the premiums won by the herd at these four shows foot up $2,645—a sum that will go a long way towards paying the expenses of the trip. By this successful series of exhibitions this breed, previously little known in this country, has been widely introduced to public favor, and doubtless the high reputation and sales of this herd will well reward the enterprise that planned the journey and the skill that has brought it to a prosperous close. At the various fairs the protests made against the admission of these Dutch-Friesians into the Holstein classes were overruled. In all fairness this decision could be justified only on the understanding that the Dutch-Friesian and Holstein cattle are substantially identical—the Dutch-Friesians being merely a tribe of the Holstein breed, or *vice-versa*, so that the reputation won by these cattle in competition with other breeds should be shared by the Holsteins generally, while their triumphs over the latter merely reflect credit on the herd or tribe.

In the RURAL of October 22 we presented to our readers a likeness of the bull Mooie, a fine specimen of the males of this herd and of the Dutch-Friesian breed. We now place before them an excellent likeness of one of the cows which has lately contributed to the Western success of the herd, Sjoerd, No. 71 in the American Dutch-Friesian Herd Book and No. 83 in the European Friesian Herd Book. She was bred by Albert S. Heeg, West Friesland, Holland; calved February, 1875; sire, Gerber; dam, Sjoerd. She was imported by her present owners, the Unadilla Valley Stock Breeders' Association, of West Edmeston, N. Y. Before her importation she had won first prize at the West Friesland fair, held at Lenwarden, Holland, in 1779. Her milk was subjected to a four weeks' test for butter last March, commencing on the 6th, with the following results:

	lbs.	oz.
Milk for 28 days	1,757	8
Average per day	62	12
Butter of 28 days	73	1½
Average 7 days' yield	18	4½
Greatest 7 days' yield	20	2
Average yield per day	2.61	
Milk per pound of butter	24	

In the Herd Book she is described as follows: "Black predominating, shield, white throat, spot on shoulders, white left hip and loin; head large but well formed; horns short, curved inward and slightly downward, black-tipped; neck fine at throat, well set to shoulders; chest capacious; shoulders thin at top; chine straight; hips very broad; rump very broad and level; handling best; escutcheon best, with thigh ovals. Length, 69.21½; width, 23¾–20½; hight, 56–56½; girth, 78½. July 7, 1880."



DUTCH-FRIESIAN COW, SJOERD.—FROM AN INDISTINCT PHOTOGRAPH..—Fig. 512.

Farm Economy.

CORN-FED STOCK.

B. F. JOHNSON.

THE corn crop in Central Illinois is, you may be sure, in a bad way, though probably the damage done by sprouting and rotting in the field, is a good deal over-estimated. Compared with last year, there will not be, for the whole State, over a third of a crop of merchantable corn; but the unsound corn, that is, the portion thought to be good enough for stock and particularly hogs, will be larger than for several years, say, since the crop of 1875. But the feeding of unsound corn which disastrously affects the health of some swine, will not be so much seen or felt this Fall as in course of next Summer, when hog cholera will probably play as conspicuous a role as when consuming the damaged portions of the crops of '75 '76 and '77. While probably hog cholera poison is not directly derived from unsound corn, the feeding of it so lowers the animal's vitality as to invite the attacks of all manner of disease, whether epizootic, infectious, contagious or otherwise. But that certain forms of disease in the human subject do arise from a nearly exclusive diet of unsound, unripe or damaged corn is notorious, chief among which is the pellagrue of the French and the pellagra of the Italians, common to the half-fed and half-paid peasantry of the south of Europe. The physiological and anatomical structure of swine and that of man, having more points in common than that of any other domesticated animal, it is neither illogical nor unreasonable to suppose a nearly exclusive diet of the same article would produce diseases of a similar or related character. The corn crops of '78 '79 and '80 were not only remarkably large, but very sound ones and so were those of winter wheat. While these crops were being consumed, hog cholera nearly disappeared, and the farmers of the country were not called upon to adopt the heroic remedies recommended by the veterinary commission, appointed by the chief of the Department of Agriculture. This commission reported with considerable unanimity that hog cholera was nearly as infectious, contagious and dangerous to swine, as pleuro-pneumonia to neat cattle and should be treated accordingly; that is, all affected and infected swine should be slaughtered and the premises occupied by such, thoroughly disinfected. Luckily the report was received with public derision and incredulity and the country was saved an enormous sacrifice.

THERE is no manner of doubt but an exclusive, or nearly exclusive, corn diet not only lessens the vitality, invites disease, and finally destroys the constitution of the progeny, but also produces butchers' meat of an inferior quality compared with that made from more nitrogenous foods. If the sole object of feeding swine were to produce the greatest amount of lard, and if bone, nerve, muscle and flesh were of small account and the health of the animal of still less, then an all-corn diet would be a proper one. But if sweet and juicy lean flesh is wanted and fat meat which wont shrink away to a rag in the pot, or fry to a mere scrap in the pan, and these to come from an animal of sound health and good digestion, then something beside corn must be provided—and that something must be more or less nitrogenous food like peas, barley, oats, milk or the product of milk in any form, and, last but not least, animal food.

I suppose I will be likely to astonish many and disgust not a few, when I say the best pork, that is, the sweetest, the juiciest and the tenderest, is often made in a slaughter-house yard, where in addition to unlimited corn, the swine have equal opportunity to satisfy their craving for animal food. The next best pork is made on grass and unlimited sour milk and butter-milk, while hogs eating mast and running at large, make remarkably sweet and juicy lean meat, but the fat is very oily, and when dry cured, becomes nearly transparent, and when aged, rancid.

But all this is so contrary to the generally accepted idea, that some explanation seems necessary. Carbonaceous foods, like corn, produce fat, and nitrogenous foods, like oats, produce flesh, therefore, when we wish to put fat on an animal we feed the former, and when flesh and muscle, the latter. But even the most carbonaceous foods contain a certain portion of nitrogenous matter, and the most nitrogenous, other certain portions of

carbonaceous substance. So if we feed a horse corn and nothing but corn he will get very fat and still be able to do some work, and a hog will do very well indeed when fed on oats or barley, but he won't get very fat, at least, not for a long time. But when corn is fed, most of its substance goes to make fat, and little is left to furnish material for building up the bony structure, the organs of digestion and respiration and the other fleshy substance of the body. But the fat through the entire body is contained in very small cells the walls of which are not fatty, but fleshy substances, and these are thick or thin according to the food furnished, thin when the food is corn or carbonaceous and thick when it is nitrogenous.

A very fat corn-fed hog is little more than a ball of lard and grease. Its vital organs have been reduced in size, its blood in quantity and the juices of the body crowded out to give place to cells containing fat, the walls of which are so thin and tender an ordinary strip of pork, cut from such an animal, will not hold together, unless supported by the skin. When the fat is fried or boiled the oil escapes and nothing is left but a mere scrap, and when the lean is cooked in any way, the meat is found dry, tasteless, hard and tough. But under a nitrogenous diet the entire bony and lean parts are fully developed, the blood is strong and rich, the juices of the body abundant, the cells have thick walls, the fat has some strength and fiber in it, and may be cut in small strips and used for larding game and lean meats. When boiled the fat shrinks some, but not much, in the pot; when fried, two-thirds of the substance remains after the oil is out; and when the lean is boiled, fried or roasted, the meat is tender, juicy and sweet. A diet of corn produces the extreme on the one side, and a meat diet, such as is afforded by milk and flesh food, on the other—and thus pork flesh is always good or bad, according to the amount of nitrogenous or carbonaceous food given.

But it is true that the fat of hogs fed on a diet largely nitrogenous, is softer under a medium temperature than if the food had been of an opposite character, but nevertheless the facts remain of less shrinkage in cooking and more sweetness and flavor. In times past when the house lights were chiefly furnished by tallow candles, those who could, obtained the tallow to make these from grass-fed beeves, because the tallow would make candles which would not run; whereas that taken from corn-fattened cattle, required the addition of alum or some other similar substance, to harden it. But the tallow of grass-fed beeves is not only harder, but the fat is harder too, and shrinks less in cooking; while the flesh is juicier and sweeter. How a grass diet favorably affects the sweetness of the fat and juiciness of the lean is well illustrated in the meat of the buffalo; and beeves fed on distillery slop, that is, on corn after the starchy portion has been abstracted, make juicier and sweeter beef than where the diet is whole corn chiefly; but the fat is softer and higher-colored.

Though popular ideas have not been corrected in respect to the value of fat as an article of diet, popular tastes have, and now when most of us buy a steak from a butcher, we say when the carcass is a fat one, "Oh, don't give me so much tallow." Fifty years ago, everybody wanted as much fat on their roasts and steaks as possible, and buyers would have been indignant had butchers cut away the fat the former are now so anxious to get rid of. Fifty years since or earlier, the price of tallow was something near that of lean meat; now it is a great deal less, that difference in price measuring, in some sense, the extent to which fat has been laid upon butchers' stock, at the expense of corn.

And now we come to the summing up of the whole matter. Within 50 years, and since the settlement of the West and the increase in the production of the cereals, and notably Indian corn, the food material for the making of fat has increased out of all proportion to that class of vegetation which makes bone, flesh and muscle; and without becoming justly sensible of the fact, we have gone astray in putting on fat at the expense of lean, and to the serious damage, not only of the health and constitution of the animals, but to the lessening of the value of the meat, in the case of butchers' stock, and destroying the health of such of our stock as are used for breeding and work. The consequences are, dear beef and pork and cheap tallow and grease, if not lard, and the appearance of a new class of diseases in farm stock of all kinds. It was a natural thing, of course, that after long centuries of feeding, during which the most costly and difficult thing to get was fat, when we suddenly became possessed of the material to furnish it at low cost, we should make use of it in an extravagant way, and that the result should be as we see; but now that the mistake has been forced on our attention in a hundred ways, the correction of abuse will come in due time, and just as a matter of course.

And hence we hear of more grass, roots, vegetables and milk for hogs, and barley, oats and peas in place of Indian corn; and for sheep and neat cattle, Winter pasture which is everywhere easy to be made on all the Blue Grass soils south of 40 degrees. Of course, the return to the medium between the two systems will be slow, and corn will always hold a prominent place as the chief and leading grain in fattening butchers' stock; but it will soon come to be recognized that for breeding stock and for young animals the less corn they have the better, where a vigorous constitution, sound health, prepotency and long life are sought.

Horticultural.

RAYS.

If you have a Calla Lily that is in bad order, shake it out of its pot and repot it into as small a pot as you can conveniently get it into, using lots of clean drainage, and a soil of little pieces of old sods out of which you have shaken the loose earth, with some sharp sand added, something through which water will percolate as freely as through a sieve. When this pot is filled with roots you should shift into a larger size and use richer soil, but always an open one.

* *

In Shaw's Gardens at St. Louis, the other day, I observed a "Collection of Bible Plants" in a plot out-of-doors near a large conservatory. Most of them were growing in pots, but set outside for the Summer. They were labeled as follows:

Almond Tree—Amygdalis communis; Eccl. xii., 5.

Apples of Gold—Citrus medica: Prov. xxv., 11.

Bay Tree—Laurus nobilis; Psalm xxxvii., 35.

Box Tree—Buxus sempervirens; Isaiah, xli., 19.

Camphor Tree—Laurus camphora; Rev., xviii., 13.

Cedar of Lebanon—Cedrus Libani; Psalm, lxxx., 10.

Cinnamon Tree—Cinnamomum; Prov., vii., 17. Rev. xviii., 13.

Fig Tree—Ficus carica; Deut. viii., 8. Matt. xxiv., 32.

Fir Tree—Cupressus sempervirens; Ezekiel xxxi., 8. Isaiah xxxvii., 24.

Frankincense—Amyris toxifera; Song of Sol. iii., 6.

Husk or Carob Tree—Ceratonia siliqua; Luke xv., 16.

Hyssop—Capparis rupestris; I. King iv.. 33.

Mustard Tree—Salvadora Persica: Matt. xiii., 31.

Olive Tree—Olea Europæa; Hos. xiv., 6.

Palm Tree—Phœnix dactylifera; Psalm lxixii., 12.

Sycamore Tree—Ficus sycomorus; Amos vii.. 14.

Wild Vine—Vitis Labrusca; Isaiah v., 5.

"The identification of the plants mentioned in the Bible is a task of great difficulty; and in almost all instances the result of the most learned investigations, whether by Bible commentators or by botanists, is unsatisfactory and open to doubt." So says the Treasury of Botany. I will not, therefore, ask what sort of Frankincense the ancients got from Amyris toxifera, but I would like to know where on earth they got hold of our Northern Fox-grape, Vitis Labrusca, which is purely an American species and nowhere found wild in the Old World. No, not even to-day, let alone 2,200 years before Columbus discovered America!

* *

In answer to a query in the London Garden about an indoor grape-vine border and the best vines to plant in it where there is plenty of heat, W. Coleman (one of the best indoor fruit growers in Britain) answers, in substance:—Build the vinery on arches or piers; have an inside and outside border; let the bed for the border be four feet deep, concreted and sloping one inch to the foot to the front, where should be a drain all the length of the border, In the bottom place a nine to eighteen inches deep layer of stones or brickbats covered over with lime, rubbish and gravel, and over that a layer of sods green side down, then the soil. To begin with, have the border five feet wide and altogether inside, or three feet inside and two feet outside and walled around with sods, and year after year, as the vines demand it, add three to four feet in width to the border. For compost use equal parts of turf from a heavy limestone pasture, one year stacked, and fresh soil free from lime off igneous rock; to six barrow-loads of this add one each of old lime rubble, charred refuse and burned earth, but no manure. Crushed one-half-inch bones with the dust, to the extent of 12 per cent. of the whole mass, may be added with advantage. Plant the vines—one-year-olds—in February, March or April. In planting, wash away all the soil from the root-balls, disentangle the roots, spread them out in every direction and cover with fine soil; then put a stake to each vine and cover the border with a mulching of short manure. Kinds of grape-vines for a warm house: Black Hamburgh, Maddresfield Court Muscat, Alicante, Foster's Seedling, Buckland, Sweetwater and Muscat of Alexandria. For Autumn and Winter use add Gros Colmar, Lady Downes. Black Morocco, Alnick Seedling, Gros Guillaume and White Tokay. I would say that ordinary pasture turf may be as good as that off a limestone pasture.

* *

Horticola's note on abutilons, p. 652, prompts me to say that so far as I know them, Abutilon insigne has no equal as a Winter bloomer. It has large, prominently netted and rusty, hairy leaves, a scraggy habit if uncared for, and in Winter and Spring, instead of producing its blossoms singly, as in Boule de Niege, or in bunches as in Darwinii, it bears them as it were in long, pendant racemes or panicled racemes. The flowers are open, prominently veined and of a purplish-brown color. It seldom blossoms in Summer, is harder to propagate than most other Abutilons and may not bear transplanting with so little impunity. Leon.

FRUIT NOTES.

CHARLES A. GREEN.

A blind man has more acute senses of feeling and hearing than his brother whose eyes are perfect. The strong mentally are apt to be weak physically—nature makes compensation for our defects. I never knew a man so bad but I could discover in him some trait to admire. Thus it is with fruits. We are searching for varieties possessing *every requirement*, but must be reminded that such varieties are an utter impossibility. We may make progress in size, or vigor, or productiveness, and lose in quality, health or beauty. At rare intervals we make headway in many points of merit, and then the world applauds. Our progress is truly wonderful, and much may be hoped for, but our expectation should not be given too wild a rein.

No fruit garden is complete without a vine of the Iona Grape. Here it sets as much fruit as the Concord, and in order to induce it to ripen early we remove a portion before maturity—the earlier the better. The Iona is of better quality when partially ripe than many varieties when at their best. Crushed in the mouth, the pulp (if it may be called pulp) dissolves instantly, and we are refreshed as though sipping the finest old wines. It is almost seedless—often having but one seed and that exceedingly small. Healthy and hardy as it is here, I wonder it is not more often called for at the nurseries. If some one should introduce a new variety as desirable, it would create a sensation. [The Iona has never borne a fair bunch of grapes at the Rural Grounds.—Eds.]

Horticola asks for an improvement in color and quality on the valuable New Rochelle Raspberry, and I assure him that I can fill the bill. An old gentleman in this county has found in his garden a seedling that proves to be of better quality and color and much larger and more vigorous. It is the largest raspberry I have ever seen, and makes the largest plant, forming a hedge behind which a farm wagon and team could be hidden from observation. If Horticola will favor me with his address, I will gladly send him plants for testing. It is called Shaffer's Colossal.—[Already referred to as being tested at the Rural Grounds.—Eds.]

Peach growers may be congratulated on the art displayed by them in covering the different varieties with different colors of gauze, ostensibly to prevent too frequent testing of samples of the fruit, but, in fact, to enhance the beauty and price of the produce. No one but the initiated imagines how marvelously beautiful a basket of red-cheeked Crawfords or Fosters may be made by stretching a two-cent strip of gauze or mosquito netting over it. The observer will notice that different colors of gauze are used with different varieties, which he supposes to be merely a matter of chance, but the suiting of the color to the variety is closely and shrewdly followed to the pecuniary advancement of the peach grower. I saw a man exhibiting some Crawfords at the Fair in baskets covered with pink gauze, and his peaches attracted a crowd, while others on exhibition, equally large and showy, were passed without notice.

Fruit growers find it important to give their goods a showy appearance in the markets. "An article well put up is half sold," is an old saying which applies well to fruit. The miserable practice of marketing grapes in market baskets holding half a bushel, whence the dealer dumps them upon his stand, where they are culled, thumbed, and clusters partially denuded by purchasers or loungers, then wrapped in a bundle like so many onions minus bloom and everything that makes them attractive, belongs to a past age. Grapes should be gathered with shears designed for that purpose, and without handling be deposited in baskets holding five, ten or twenty pounds. These baskets should be covered, and sold by the pound with their contents

The strawberry beds will soon require covering for the Winter. The covering is often put on too early. In fact, it is the repeated thawing and freezing of Spring that often do the greatest injury. When the earth is frozen hard enough to bear up a wagon and team, the time to cover has come. If one has a few valuable plants it will pay to cover the beds with evergreen boughs just enough to shade the plants—this is the best of all coverings. Litter from the horse stable is generally used, as it is light and easily scattered, and enriches the soil. The objection is that Timothy, clover and other seeds are not destroyed by the digestive organs of the horse, and these seed down the strawberry beds that have been so carefully weeded. If wheat straw is spread now in the pasture or orchard and permitted to be picked over and trodden by the stock for a few weeks, weed seeds will be detached from it, the straw shortened, and a desirable mulch secured. Heavy, cloddy manure should never be used for the covering of strawberries. Generally twice the amount of covering necessary is applied. On our clay loam covering is not absolutely necessary, yet it will pay by increasing the yield in most seasons. On low soils or any subject to heaving, covering is indispensable.

It is often desirable to heel in trees and vines during the Winter, but this is a hazardous undertaking with the novice. High and dry ground should be selected, the soil made fine and firmly pressed about the roots which should not be crowded together. Nurserymen cover stock thus heeled in with evergreen boughs, and when the work is well done the stock is safer than when left undug But through haste and carelessness I have seen stock taken out of the trenches in the Spring with blackened or moldy roots—completely ruined. If it is impossible to find an elevation, a ditch should be opened to permit surplus water to escape.

Monroe Co., N. Y.

NOTES AND COMMENTS.

Yes, Horticola (page 662), the abutilons are excellent plants for room cultivation, and in the greenhouse or conservatory they are indispensable. Good, strong plants of A. Mesopotamicum and A. M. variegatum, when grown in six-inch pots and suspended from the rafters of the greenhouse, and when trained on a low, circular trellis, are, when in full bloom, excellent decorative plants. But in order to see the flowers of this pretty species in all their beauty it is necessary that it should be grafted or inarched on some of the robust-growing species, such as A. Santana or A. striatum, about four or five feet high. With a little care and attention as to pinching back the shoots, it will soon form a compact head with drooping branches reaching almost to the ground, and when in full bloom no plant can equal it in beauty.

A. Thompsonii is also an excellent room plant, and, whether in blossom or not, is always attractive on account of its leaves being beautifully mottled with golden spots. It requires to be grown in a sunny situation in order to bring the variegation out distinctly. Its flowers are produced in great profusion throughout the entire year. If I were confined to the choice of one abutilon, I would select this.

A. Sellowanium marmoratum is another exceedingly attractive variegated variety and is also an excellent foliage plant, the large leaves being of a golden yellow, richly tesselated with green. A. Auguste Pasewold is another beautifully variegated variety, the large, thick-set, dark-green foliage being elegantly blocked with yellow. A. roseum superbum is another very distinct variety, and one that is well adapted for room cultivation on account of its producing flowers in the greatest profusion. The flowers are of a rich rose-color, beautifully veined with delicate pink. A. William Fowler, with bright yellow flowers; Snow Storm, of dwarf, compact habit and pure white flowers; Santana, dark crimson, are also excellent varieties..

In cultivating the abutilons it is well to remember the fact that they are greenhouse shrubs, attaining a hight of from four to eight feet, or even more, so that where the necessary room can be given, large, old plants are valuable on account of the immense quantity of flowers which they produce. They can be given the treatment as advised by Horticola, but for window cultivation I think that smaller plants would be preferable; so for this purpose I advise that young plants be propagated or procured in the Spring and planted out in

sunnny situation about the end of May, about four or five feet apart, so that they may not become drawn. Pinch the shoots back occasionally if they show a tendency to grow out of shape, and about the middle of September take them up carefully and pot them, using a compost composed of two-thirds well-rotted sods and one-third well-rotted manure.

IS THERE any remedy, that can be easily and cheaply applied, for the cabbage worms? I never saw them so numerous and destructive as they were during the past season. Whole fields of both cabbage and cauliflower have been destroyed by them. In this vicinity many remedies have been tried, but without success. The question is how to apply them, as most of the worms work on the under-side of the leaves. CHAS. E. PARNELL.

Queens Co., L. I.

THE CYCLAMEN.

PETER B. MEAD.

THE cyclamen is a beautiful winter-blooming plant, and is not yet as well known as it deserves to be, especially among amateurs. It is highly prized by those who know it. There are several species of the cyclamen, some one of which is in bloom from Fall till Spring, C. autumnalis being the first to show its pretty flowers, and it should be the first planted. The best known among us is the C. Persicum, of which there are not a few varieties or variations, the foliage generally differing more than the flowers. Some decided improvements, however, have recently been made, the most striking, in foliage and flower, being known as Giganteum, of the Persicum type, a very good portrait of which accompanies this article.

The cyclamen will flower freely either in the greenhouse or the sitting-room, and responds generously to very ordinary care after having been once established. The plants may be raised from seed, and in experienced hands small flowering corms may be produced in one year from the sowing; but the better way is to buy the corms. These may now (Nov.) be bought of the florist already potted, or of the seedsman, who imports them. Those bought of the seedsman will be dry and very much shriveled, and seem to be more dead than alive. The soil I use is made up of rich loam (rotted sod being best), leaf mold and sufficient sand to make the mixture light and porous. The corm should be laid on the surface of the soil, very slightly pressed in, and secured in position by a couple of bent wires or pegs till roots have been emitted. The watering should be light till the corms have filled out and begun to grow. They should be watered regularly and freely when in bloom, and the water gradually withheld in the Spring when the flowers have disappeared.

At this point there is a difference of opinion as to the treatment. Many withhold water altogether, and let the corms dry up; but this practice is going into disuse. I have always succeeded best by withholding water gradually in the Spring, but never allowing the soil to become so dry as to cause the corms to shrivel. In fact, I generally set the plants together in a shady place in the open air, and give them a dash of water occasionally till Fall, when I turn them out of the pots, shake off all the soil that will come away, and repot them, giving them pot room according to their needs. This is simple and is really all that is needed.

A single corm, carefully grown, can in time be made to produce three or four hundred flowers in a season; such a plant is a rare and beautiful sight. It is a beautiful plant, in fact, at all times, the foliage being ornamental and the flowers unique and striking and sometimes quite fragrant. It will do best in a moderate or low temperature. Red spiders and mealy bugs will sometimes prove troublesome, but frequent syringing or occasional washing will keep both in subjection.

THE MOCK-ORANGE OR SYRINGA.

WILLIAM FALCONER.

BOTH of these names are applied to one of our commonest and prettiest garden shrubs. On account of the orange-blossom fragrance of the flowers of some of the kinds, the common name of Mock-Orange was given to these shrubs; as Syringa is the botanical name of our lilac shrubs, I think it is inapplicable to those which are botanically known as Philadelphus, therefore I would suggest that we drop the name Syringa in this case and cling to that of Mock-Orange.

Mock-Oranges are very common and very beautiful, copious and in most cases hardy, and they are usually in blossom from the first of June till the first of July, of course, earlier or later according to the part of the country in which they are growing.

Several of them are indigenous to the United States, some to Eastern Asia, and others of unknown origin are supposed to be garden varieties; indeed, the species throughout are rather ill-defined. The first to come into blossom is P. coronarius; it has creamy-white flowers that are powerfully fragrant. It is a native of Japan, etc. There are single and doubled-flowered as well as a dwarf form of it. P. hirsutus, a hairy-leaved species from the Southern Alleghanies, and which has smallish, white, scentless flowers, is next

CYCLAMEN PERSICUM GIGANTEUM.—FIG. 513.

in order. It gets cut back considerably in severe Winters. This species is sold in the Southwest as P. Mexicanus. Then comes P. inodorus also from the stream banks of the hill-country of the South Altantic States; its handsome variety called grandiflorus, also wild there, and other kinds as P. latifolius and P. speciosus of unknown origin, but all

THE MOCK-ORANGE—PHILADELPHUS SPECIOSUS.—FIG. 514.

apparently quite hardy. Bringing up the rear are Lewisii, a smallish, spreading and somewhat tender species from Oregon; and Gordonianus, a tall-growing species found wild along the shaded banks of mountain streams from California and Oregon into Washington Territory. Besides these, there are other reputed species and several varieties grown by our nurserymen.

Mock-Oranges grow readily in our gardens and are easily propagated by means of cuttings of the ripe, one-year-old shoots or seeds. They blossom best when grown in an open situation, and delight in good soil and moisture, but the better they are fed the ranker they will grow and that is rather objectionable than otherwise. There is only one thing in the culture of the Mock-Orange, that I think calls for pronounced attention, and that is pruning. The usual method is, about midsummer to top over the shrubs, like hedge plants, with shears, thus leaving stumpy thickets of shoots, and robbing them of most of their flowering wood. Better keep the shrubs well thinned by the entire removal of most of the root sprouts, and annually reducing old wood in favor of that which is firm and young, and moderate cutting back of the shoots that have just bloomed, and a partial bit of judicious Summer shortening of the current growth.

P. speciosus, the subject of the illustration, which we reproduce from the Gardeners' Chronicle, is, so far as size and showiness are concerned, one of the handsomest of all Mock-Oranges. It belongs to the P. inodorus class. If I could have but one Mock-Orange I would take speciosus; if two, speciosus for its large, white blossoms, and coronarius for its fragrance.

Asparagus.

Will Mr. Mead in his next article inform us which is the best time for cutting off the tops of asparagus? Some say after the first hard frost or two; others that this injures the roots, and that the tops should not be cut before the last of March in this climate. If left on till then, the seeds are scattered over the garden, germinate and make plants, which are as much in the way of the gardener as so many weeds. If cut off in Autumn, the asparagus can then be dressed with stable manure, to lie on and protect it all Winter. In the Spring this can be forked in among and alongside of the roots, and be all the fertilizing the crop will need. It would be more desirable to cut off the tops and dress it in Autumn, because the gardener is not so hurried in his work as in Spring. B.

GLADIOLI.—To multiply more rapidly this magnificent flower, save the little bulblets. If well grown they blossom the second year, and occasionally sport. I have a new color this season from such a sport. It requires three years for seedlings to blossom. I get nearly as many new varieties from my offsets as from my seedlings. D. S. MARVIN.

[We have saved hundreds of the bulblets and they usually come pretty true to the parent bulb.—EDS.]

Field Crops.

TOBACCO-GROWING NOTES.

AS SOON as tobacco has become thoroughly cured it should be taken down from its hanging position in the curing barn and the plants piled in "ranks," with the butt-ends of the stalks outward, and carefully covered upon the top to prevent the leaves from drying. This work can only be done when the leaves are made soft and pliable by warm, damp weather. It is very important that the tobacco is in good condition as regards moisture when taken down, otherwise artificial means for moistening the leaves will be necessary, which necessitates additional labor and risk; for tobacco is sometimes seriously damaged, and even ruined, from improper artificial dampening. It is wise to take down as much of the crop as possible before Winter fairly sets in, for if left, an opportunity may not occur again until Spring, when the work of taking down, stripping and assorting will prove much more expensive, for it will greatly interfere with the regular Spring work of the farm.

WHOEVER has tobacco to manipulate during the coming Winter should provide a good place in which the work can be done comfortably and conveniently. The necessary requirements for a good tobacco assorting-room are that it shall be large, light and warm. The room should be furnished with tables or benches, on which the work of assorting the leaves can be done conveniently. A sky-light window gives the best possible light for the work, as the rays of light then fall directly upon the leaves and over the shoulders of the assorters, which gives them better opportunity to judge correctly of their qualities. A side-light window, with the light shining directly against the face of the workman, is to be avoided, for it is not only very trying to the eyes, but the work cannot be accomplished so pleasantly or so effectually.

THE sooner the leaves are stripped from the plants, after they are taken down, the better. If allowed to remain in a "rank," or pile, with the leaves left upon the stalks, fermentation is almost certain to occur in warm weather, which will result in serious damage to the crop. The leaves should be carefully stripped off the stalks, one by one, and tied in small bundles weighing five or eight pounds, with a coarse cord which will not cut the leaves. The bundles should be tied near the center, so that the butts of the leaves will have opportunity to become thoroughly dry and compactly "ranked," with their butts extending outward. The tops of these ranks should be kept well covered to prevent the drying of the leaves, and if weights are placed on the top of the rank, all the better.

GREAT CARE needs to be exercised while manipulating leaf tobacco, not to allow the leaves to become dry. The piles, or "ranks," should be kept carefully covered, and the

stripping should be done, so far as practicable, in warm, damp weather. The assorting also should be done in a warm, damp atmosphere, made thus either naturally or artificially. The latter requires that the work be done in a tight room in which the air is impregnated with moisture from the evaporation of water. A kettle placed upon a stove in which there is a steady fire day and night, kept filled with water, will accomplish the desired result in a close, tight room. G. A. G., JR.

Chemung Co., N. Y.

NOTES FROM THE RURAL FARM.

We planted a patch of the Early Ohio Potatoes April 23. The crop matured July 12. They were planted in sandy soil without manure, single eyes one foot apart in drills three feet apart. They were hoed once and London-purple was applied once. The yield was at the rate of 150 bushels to the acre. There is much to be said in favor of this variety—a seedling of the Early Rose. The tubers lie close together in the hills and are remarkably uniform in size. The Early Ohio has with us a flesh-colored skin. The eyes are sometimes deep, though generally as shown in the cut, Fig. 515, which is characteristic in shape and size. The flesh is nearly white with more of the potato, or "strong," flavor than most others of the same parentage. The vines grew only a foot in hight and bore no blossoms. As the tubers grow close together in the hill and average only medium in size and the vines are short and upright, it will appear that the pieces may be advantageously placed less than one foot apart and the drills not over two feet apart. So cultivated, a large if not a heavy yield might be looked for. The Early Ohio is everywhere among the earliest of potatoes—upon this farm the earliest of any we have ever tested. It submits to slouchy treatment, and a single cultivation with the harrow after the sprouts appear, suffices to produce a fair crop. It has been grown in this neighborhood for several years and as a first early potato is preferred to the Beauty of Hebron.

The drought is finally broken. Occasional showers are falling as we make these notes—one having time to soak in the ground ere another commences, the weather remaining warm. While this is helpful to the growing wheat, it will scarcely determine many farmers to sow wheat who have been unable to sow before this time.

THE BRITISH WHEAT CROP OF 1881.

J. B. LAWES.

[Dr. Lawes favored us with an advance slip of the following, which was first published in the London Standard. We were unable to print it, however, until this issue.]

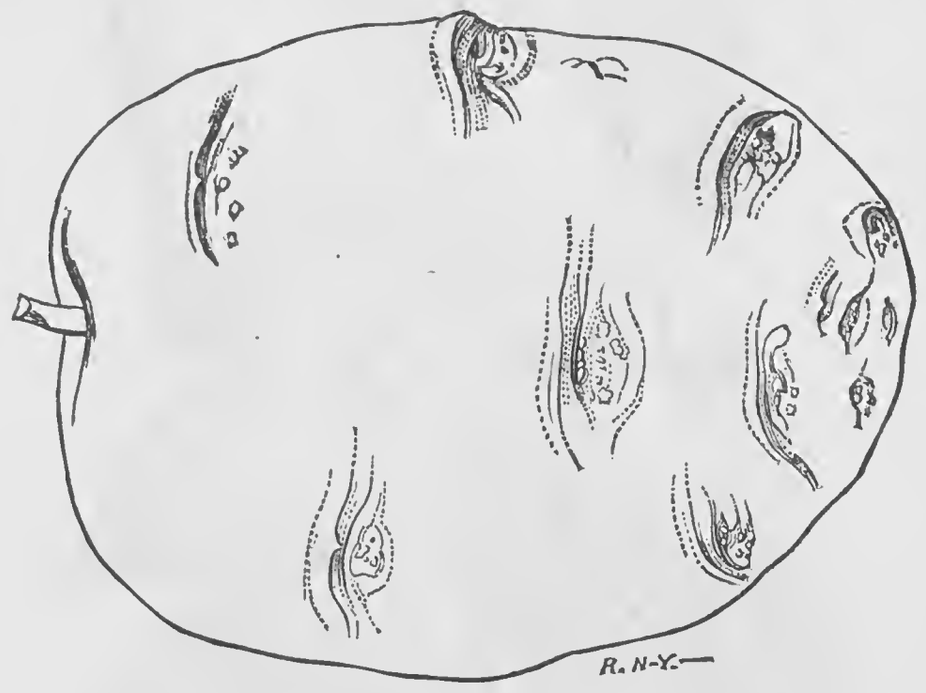
The seven seasons ending with 1881 have been more disastrous to British agriculture than any seven consecutive years of which we have a record. Those who hold the opinion that the fluctuations of the weather occur in definite cycles will have some difficulty in finding a parallel to the period of the last seven years without going back to very remote records.

The change in the relative proportions of home-produced and imported wheat which has taken place during the last few years, has entirely altered the character of the trade. In 1868-70 two-thirds of the total bread consumed was the produce of home-grown wheat. A few years later the requirements of the country were met by one-half of home-grown and one-half of foreign wheat. But the harvest of 1879 scarcely supplied one loaf in four required, that of 1880 only one in three, and that of 1881 will also supply only about one loaf in three required.

We cannot ignore the fact that, in consequence of these great changes, the question of a good or a bad wheat crop, however important it may be to the land-owner or the cultivator, is no longer of the same importance to the nation at large as it was formerly. Another point worthy of notice is that, although our requirements for foreign wheat are becoming larger and larger, the fluctuations in the amounts required from year to year are becoming much less. Thus, after the bad season of 1860, the net imports of wheat increased from 4,500,000 to 10,000,000 quarters, or by more than 100 per cent. In 1872-73 the imports were 3,000,000 quarters more than in the previous year, corresponding to an increase of about 33 per cent. But after the harvest of 1879, the worst on record, when the net imports of wheat increased from 14.1 to 16.4 million quarters, the increase only amounted to about 16 per cent.

During the year ending August 31, 1881, the amount of foreign wheat retained for home consumption was more than 16,000,000 quarters. As the area under wheat in the United Kingdom was last year rather less than 3,000,000 acres, a deficiency of half a quarter per acre in the yield of the crop, although a very serious matter so far as the interests of the cultivator are concerned, has comparatively little influence on the requirements of the country at large for foreign wheat.

I have no doubt that my estimate of the home wheat crop of 1880 was considerably too high. The average of the usually selected plots in my experimental wheat field showed a produce of 27 bushels, reckoned at 61 pounds per bushel. There was not at that time sufficient evidence to show how exceedingly bad was the yield of the crop upon the lighter soils; nor can I now account for the fact that in that year wheat grown continuously was so much better than wheat grown in rotation. For example, in the experimental field of light soil at Woburn, the land growing wheat every year showed but little difference between the crops



EARLY OHIO POTATO.—FROM LIFE. FIG. 515.

in 1879 and 1880; but where, in the same field, wheat was grown in an ordinary four-course rotation, after clover fed off by stock with cake or corn, or without cake or corn but with an application of artificial manures, the produce of 1880 was from 11 to 16 bushels per acre less than under the same treatment in the very bad season of 1879.

In the following table is given the produce in 1881, upon the same selected plots as usual, in the field at Rothamsted, which has now grown wheat for 38 years in succession. There is also given for comparison the average produce, on the same selected plots, over the last 10 years, 1871-1880; over the preceding 19 years, 1852-1870; over the total period of 29 years, 1852-1880; during which time the same manures have, in every case, been applied to the same plots:—

HARVESTS.	Mean of plots 3, 2 and 7, 8, 9	Artificial manures. Plot 9	Plot 8	Plot 7	Farm-yard manure—plot 2	Unmanured—plot 3

Average 19 years, 1852-70	31	31	31	31	31	31
Average 29 years, 1852-80	31	31	31	31	31	31

(1) Equal to 24 bushels, at 61 pounds per bushel.
(2) " " 22¾ " " 61 " " "
(3) " " 23⅝ " " 61 " " "
(4) " " 26⅜ " " 61 " " "

These figures do not show much prospect of an abundant harvest. The yield per acre is low, and the quality indifferent. In no case among the nearly 40 plots in the experimental field does the weight per bushel reach 60 pounds, and the produce of straw is at the same time exceedingly low. In an adjoining field 21 varieties of wheat were grown side by side; not long before harvest the crops presented an exceedingly luxuriant appearance, and it was considered that the yield would be from 50 to 60 bushels per acre. The result of the thrashing is, however, disappointing. The highest produce in the field is only 54 bushels per acre, with a weight per bushel of 57½ pounds, and the lowest produce is, in two cases, 39½ bushels, in one with a weight of 61 pounds, and in the other of scarcely 59 pounds per bushel. It is, I think, quite evident that the yield of the wheat crop will vary very much, not only in different districts, but in the same district, and even in different fields on the same farm.

The produce in my experimental field, taking the mean of the same selected plots as for many years past, shows an average of 24 bushels per acre reckoned at 61 pounds per bushel; and assuming an average crop of wheat to be 28 bushels, the crop is 14 per cent. below the average.

According to the returns of the Registrar-General, the population of the United Kingdom was a little below 35,000,000 on June 30, 1881. Making due allowance for the natural increase, the mean population to be fed during the year commencing Sept. 1, 1881, and ending August 31, 1882, will be 35,280,000. Estimating the consumption at 5⅝ bushels of wheat per head, the quantity required to feed the population will be a little under 25,000,000 quarters, or 200,000,000 bushels.

The area under wheat in the United Kingdom was, during the past harvest year, slightly under 3,000,000 acres. If the yield in my experimental field be taken as a guide, the total wheat crop of the country would not amount to 9,000,000 quarters; and, deducting from this the amount required for seed, the quantity of home-produced wheat left available for consumption would be only about 8,000,000 quarters; and we should thus have to depend upon foreign supplies for nearly 17,000,000 quarters, or 136,000,000 bushels. As, however, wheat has risen considerably in price, and the potato crop is likely to be abundant, it is probable that our requirement for foreign wheat may be satisfied by an import equal to that which we have received during the last two years—namely, from 16,000,000 to 16,500,000 quarters.

With a stationary or decreasing area under wheat, and a rapidly increasing population, it is probable that, before many years are past, the home produce of wheat will not furnish more than one-fourth of the total amount required.

Old Sweet Potatoes Under New Names.

A writer in a recent number of the Rural speaks of growing Bliss's Early Golden, Peabody and Southern Queen sweet potatoes. This suggests to me that here are two potatoes under wrong names. That under the name of Peabody introduced some five or six years ago, was nothing but the Red Bermuda that has been in cultivation as long back as I have known sweet potatoes. After growing the Peabody and comparing it with the Bermuda and calling the attention of growers to the two, there was no room left for doubt as to their identity, and I so reported to an agricultural journal, possibly the Rural New-Yorker. This seemed generally to be accepted, but I notice a noted grower of plants still puts it out under the name of Peabody. This custom of selling an old plant under a new name is too prevalent, and where known to be such, can be characterized, if the truth is told, as a dishonest one. I find also that the Early Golden introduced in 1880, is identical with the Yellow Strasburg, a variety sold under that name in the West as much as four years ago. And I have a letter lying before me from Rev. Leon Wilson, of Cynthiana, Ind., which narrates how he found a vine growing among some Bermudas, differing from them in color, and, that having sent it out to different parties it came back to him under the name of Yellow Strasburg. I grew this and the Early Golden which I got of the Agricultural Department, together, and they proved alike in every respect. These statements are made in the interest of truth and fairness. J. A. Foote.

The Swine-Herd.

PIG EXPERIENCE.

COLONEL F. D. CURTIS.

Last year we lost money on a pen of pigs. The price of pork was low and we thought we would feed them a month or two longer, although the weather was beginning to get cold, and we would have the advantage of an increase in price as well as an increase in weight. We made the pen as warm as possible and fed them all the shelled corn they would eat, thoroughly cooked. After feeding them a full month, the price of pork being no higher and the pigs apparently not gaining, they were slaughtered. We were satisfied that the corn consumed was a loss. The manure which was made did not any more than pay for the labor of cooking the feed and the care of the pigs. This year we are not disposed to try any more such experiments. This mistake is often made by farmers of feeding without any profit.

It requires very close calculation to make profit in fattening animals. We have several sows now suckling pigs which we designed to turn off this season. Corn is worth 72 cents a bushel, and pork is nine dollars a hundred in our markets. On this basis will it pay to try to fatten these hogs? We do not think it will. We have heard old farmers say that it will always pay to fatten pigs when pork would bring as many dollars a hundred as corn is shillings a bushel. No doubt this rule is good when the fattening can be done in warm weather. In cold weather the ratio should be double for the price of pork; for our experience teaches us that animals will not gain half as fast in cold weather as they will in warm, and although the price of pork is exceptionally high, we have concluded to winter these sows. They can be nearly wintered on the corn it would take to fatten them, or, what is better yet, they can be wintered on apples and roots and the corn be saved. The corn which it would take to fatten them will furnish feed in the Spring to prepare the pigs for sale, and make a handsome income. After that, if allowed to go without offspring, by early Autumn they can be made nearly ready to butcher on pasture alone. This is the cheapest way to make pork.

The cider mills in this vicinity are offering 12½ cents a bushel for apples. Farmers generally sell to these mills all their apples which are not good enough to market as barreled fruit—such as refuse grafts and common apples. We shall put ours in the pig-house cellar to feed to the hogs. Father used to winter his store hogs entirely on apples and they kept in good condition. We are satisfied that six bushels of apples will go a good deal further in feeding pigs than a bushel of corn, which is the relative proportion at the present price of both.

A man refused the other day to buy a thoroughbred boar pig, although he said he wanted him very much, because he could not get him for one dollar less than the price asked. This is a kind of economy which may save a dollar—but is it wise? We rather commend the more progressive farmer who thinks that the best is the cheapest.

It is surprising to those not acquainted with the fact to see how much crude sulphur pigs will eat when fattening. It should be given to them every few days; or, what is better yet, be kept in the pens where they can help themselves to it. When pigs are fed a large amount of hearty food, their stomachs become disordered and they need sulphur and charcoal to neutralize the acidity and to correct the condition of their stomachs. When it is given to them plentifully they will eat better, digest more and are freer from bowel disorders. These correctives help to keep the blood pure and the skin free from affections. When hogs have these correctives their flesh must be healthier. We have had hundreds of hogs and never a case of cholera, which we attribute to the healthful effects of plenty of charcoal and sulphur together with succulent feed. A long-continued corn diet will invariably produce fever and more or less inflammation of the stomach and bowels.

The Horseman.

EASTERN MARKET FOR WESTERN HORSES.--No. 1.

L. S. HARDIN.

It was one of the wisest sayings of the "Bard of Avon" that "the bearer of ill news hath but a losing office." No one is very fond of being told a disagreeable truth, and therefore a little censure may fall to my part if I in any degree contribute toward destroying one of the idols of horse worship; as it is proposed, however, to deal with this subject solely from a money point of view, if my facts hold good the conclusion can be drawn by each reader to suit himself.

That the Eastern farmer has been following a cruel delusion until his market has abandoned him, I think it is not only easy to demonstrate, but still easier to point out the

sources whence the false teaching emanates. In the first place, our human nature carries a superfluous and burdensome quantity of the spirit of gambling—the desire to take a chance based upon our superior judgment and skill; This weakness of our nature is taken advantage of by parties with a view to make a profit out of it. Hence we find the arts and allurements of the race-course, with its exciting contests and many risks, enlisting the ambition of every country boy with the hope that some day he may be able to produce a a colt that will win not only the thundering applause of excited thousands, that he reads about in the papers, but the more substantial emoluments of the race track in the shape of rich purses. In the lottery of breeding fast horses somebody is bound to win a Maud S or a St. Julien. Of the thousands of losers who contribute to the prize we never hear. Thus not only the young men of the farm but those who are old enough to know better go on from year to year in the effort to raise the horse that can win the money. Now, let us see what the result of that practice has been.

Trotters it is well known "go in all forms," and for the matter of that in all sizes, too; but the first requisite of a fast trotter is to have plenty of day-light under him. To get the benefit of whatever skill has been developed in breeding race-horses the mass of farmers have been compelled to adopt certain families that have shown a predisposition for speed. Among the numerous families we may mention Hambletonians, Clays and Black Hawks as the most prominent at the East. By breeding stallions of these families to leggy, cold-blooded mares, a class of weak, leggy animals has been created and the "bone and sinew" of horse flesh well-nigh eliminated from the race.

If these statements are true, then let me ask the question: Does it pay the highest profit to raise this class of horses? I think it easy to demonstrate that not only does it not pay, but that it is rapidly destroying what little is left of a market for Eastern-bred horses. In the first place, has anybody ever made money by simply breeding trotting horses? By breeding is not meant trading in horses, nor will it do to say a man makes money by breeding trotters when he has bank stocks and factories to furnish the money for running his farm. The prizes are so far apart that not one in a thousand succeeds. Then if the horse does sell at a fabulous figure it is never procured until his speed has been developed, and that is almost invariably done by some professional horse jockey, and it is he who reaps the benefit, and not the breeder. For medium or even high-class trotting stock the general market is destroyed by wealthy breeders who throw large numbers on the market and care nothing for the prices obtained, as they simply breed for pleasure and are entirely independent of success in obtaining remunerative prices.

The expense of raising a colt to a marketable age is seldom properly calculated. He is generally looked upon as a scavenger to eat what would otherwise go to waste on the farm. Such, however, is not the case. A colt is rather a dainty feeder, and eats very little that other stock reject. The outlay of money and trouble in raising him is so small day by day that it goes by unnoticed, but the aggregate is pretty large, and if the expense be carefully summed up, it will be found that he costs not less than from $150 to $200 by the time he is four years old, in addition to cost of service of the stallion. The demoralizing effect upon young men of training trotters is too apparent to need even a hint of warning to the average father.

The question as to what size horses should be to produce the greatest profit to the breeder is dependent somewhat upon circumstances. If needed only for farm use and driving long distances to market, a horse of 1,200 pounds' weight will probably do the work with greater speed and less injury to himself than a horse that weighs 1,600 pounds. It is probable in this country farmers could do their work with greater economy by the use of heavier horses than they are accustomed to employ, by hauling heavier loads, using double plows, larger harrows, etc., as farmers now do both in Continental Europe and in England. But my principal purpose is to induce those who have the proper appliances to consider if it will not pay them to furnish large, stylish horses for carriage and draft work in the large Eastern cities.

Farm Topics.

THREE HORSES ABREAST.

I noticed in a late RURAL another of those complicated three-horse eveners, and I take the liberty of sending you a sketch of one that I have used for a long time and which I like very much. It is light, simple and cheap. The evener, A, five feet long, is two inches thick, four inches wide at the middle point, and two-and-a-quarter inches at the ends. At B, B are two plates of two-inch band-iron, with cast-iron rollers, as shown in the cut. C, C are small cable-chains with hooks attached at the ends. The hooks at the ends of the evener are represented at D, with a loop, which slips over the end of the evener, and is fastened with a staple in the back side to admit of freer movement. By removing one set of pulleys and chains, and moving the other to the center of the evener, two horses may be used conveniently. A. V. CLARK.

Miscellaneous.

RURAL BRIEFLETS.

WE believe this is the largest White Elephant Potato we have heard of:—

Stratford, Ont., Canda, Oct., 22.—This may be of interest to you, from the Seaforth Expositor: "Mr. John Teddy of East Wawanosh, has grown potatoes on his farm this season some of which weigh over three pounds and three ounces. These potatoes are called the White Elephant and the seed was procured from New York." White Elephants took first prize at South Perth County exhibition at St. Mary's, Oct. 4. and 5. C. W. Y.

WE have to thank Mr. A. L. Crosby for the following light upon the history of the Black-bearded Centennial wheat:

In the RURAL NEW-YORKER of October 22, you ask for help in tracing the history of Black-bearded Centennial Wheat. I will see what I can do to help you. In '76 there was shown at the Centennial Exhibition some wheat from *Australia* I think, but won't be sure. A Mr. Easter, of Baltimore, procured some of it and grew it for a year or two and in the Summer of '79 I first heard of it, and about that time I sent to the Department of Agriculture for some new variety of wheat to try, and I received two quarts of white wheat labeled Back-bearded Centennial, and the label also stated that it was grown by Mr. Easter. I saw Mr. Easter and he gave me the account of it that I have given you. My wheat I drilled in the same field with Fultz and found it considerably later and not nearly so hardy. On harvesting, I found some of the beards, which were unusually long, were tipped with black and some were white. The wheat as sown was a dirty white, the berries large, some of them shriveled and not handsome by any means. The wheat I grew was greatly changed in color on account of the character of the soil (a red loam) and might be called a light red. The yield was not satisfactory and as it was late and not hardy I did not sow it again. Mr. Easter has now been dead about a year or I could refer you to him for these facts. As I have a little space left I cannot refrain from telling you how much I am pleased with your journal. I think you are doing a good work. I took the RURAL for a trial of three months when it was published at Rochester, and three months' trial was sufficient. But now if any farmer can read it for one year and not get his money's worth, he either knows all there is to know or else he doesn't know anything. A. L. C.

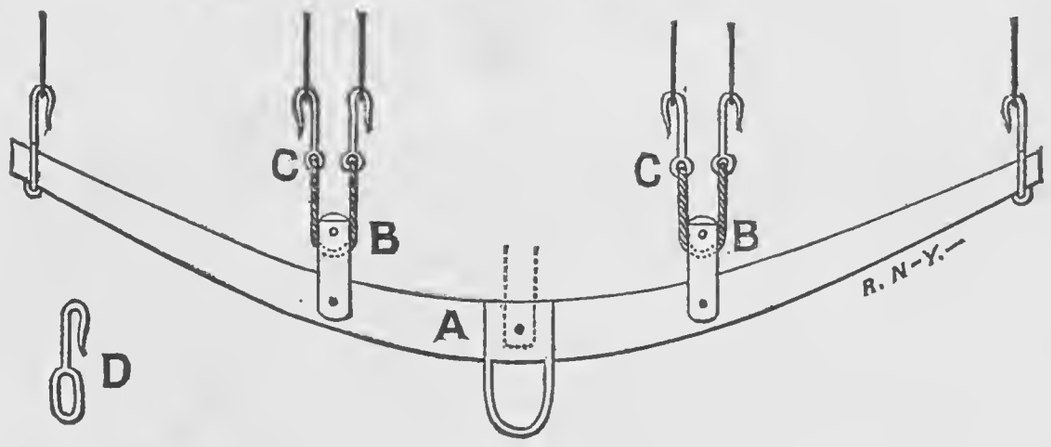
AWHILE ago, we reproached our correspondents Messrs. Holmes & Sweetland that their praises of the far western country in which they are traveling, were excessive. Here is a part of their reply:

"WE claim that our letters are free from personal flatteries and so far as they are commendatory of the country passing in review under our pencils, they are, in every respect truthful, and nothing could induce us to misrepresent through your columns, both for the reputation of the RURAL and ourselves. There are thousands of people East—readers of your journal—who desire to know of the topography, soil, climate, products, price of the lands and farms, taxes, streams, timber, railroads, stock-raising, dairy product, schools and society in this great West, and this information we endeavor to give tersely and truthfully, and have not made any statements in our correspondence but what are capable of convincing proof; hence the admonition to "keep within the truth," is fully in accord with our views and practice. It is a fact that the simple truth regarding much of this Western country, is so far beyond the comprehension of many Eastern farmers that for years they have heard and read with incredulity, and this is the principal reason why so many of them have not long ago come West, and placed themselves within the range of absolute conviction and conversion.....

AWHILE after we sent out the now well-known Cuthbert Raspberry in our Free Plant and Seed Distribution, Judge Parry of New Jersey introduced the Queen of the Market Raspberry. These two were soon ascertained to be the same and Judge Parry's attention has several times been called to the fact. Nevertheless he still maintains there is a difference—still sends out the Queen of the Market as if it were entitled to the name. When leading horticulturists themselves disseminate plants under erroneous names and decline to rectify the error when it has been repeatedly and authoritatively pointed out, there can be no end to the impositions which the purchasing public are obliged to submit to.....

Now comes the "Lost Rubies" Raspberry, introduced by Mr. Chas. A. Green, an enterprising, competent and, so far as we know, conscientious nurseryman. This raspberry is said in some respects to be more valuable than the Cuthbert. But Mr. Purdy, of Palmyra, N. Y., who has had years of experience with small fruits, expresses a positive opinion that it is Naomi, an old variety that has already at various times been re-introduced under other names. Years ago Mr. A. S. Fuller presented the writer of this with a collection of his raspberries, which we have since carefully preserved. Among the collection was Naomi. Comparing it with Lost Rubies as the latter comes to us from Mr. Green, we find that the canes of the latter are purple while those of the former are green. How is this? If Mr. Purdy is right then our Naomis are not Naomis or our Lost Rubies are not Lost Rubies.....

MR. GREEN, as we understand him, does not claim that Lost Rubies is a new variety. It differs from any other variety with which he is acquainted, and although he has consulted others, he has thus far been unable to identify it with any of the old kinds. Of one thing we feel assured, should it prove to be Naomi or any other old raspberry, Mr. Green will not follow Judge Parry's example and continue to sell it under its new name.....



THREE HORSES ABREAST.—FIG. 516.

WE wish the banana was better known as a conservatory plant, presenting to our eye one of the noblest types of vegetation. But it need not be confined to conservatories, since it stands both the dust and heat of a living-room much better than many inferior plants which are cultivated for their large leaves. We speak of Musa ensete. The fruit is not edible like that of the plantain and banana which are sold in the streets and fruit stores. These are M. paradisiaca and sapientum. The fruit of the former is longer and not so thick and has what might be called a core running through the center, which is tough and disagreeable to the taste. Musa ensete also stands wind and rain with little laceration while the others are torn into shreds. In tropical countries the value of these plants is scarcely less than that of cereals and tubers and roots in temperate countries. In the tropics it is said, "the pith of the stem, the tops of the floral spike and even the shoots of several species are eaten as vegetables." Cultivation has produced many varieties of form, color and taste. . . . . Another plant which will stand any amount of dust is the India-rubber Tree, Ficus elastica. We have seen very good specimens of this even in the street windows of New York. It may be cut back from year to year as it grows too large for the space it is to occupy. It will stand light frosts and its leaves are large, glossy and of a deep green color.....

A RESPECTED friend writes us as follows: "Our good friend Mr. Mead has given only the laborious and expensive method of making and cultivating an asparagus bed, as practiced in the gentleman's small, fenced garden. Perhaps he means to give field cultivation hereafter. I never allow my garden fence to be so near the cultivated ground that a horse and wagon or a plow cannot be run out at every side with plenty of room to turn, etc. I cultivate the whole garden almost entirely by horse power, and thus make and cultivate an asparagus bed at about one-fifth the cost of doing it in the way described by Mr. Mead."

OUR friend and contributor, Chas. E. Parnell, need scarcely have looked for the Tomato Worm even as late as the middle of September. We do not doubt that Mr. Stewart is quite right in attributing the tomato rot to a fungoid origin—but our readers will find that the tomato worm causes the rot too.

What Others Say.

IN the Fall of '79, about the middle of October, a writer in the Michigan Farmer thought his wheat destroyed by the fly, and he sowed a piece about the 20th, thinking at least that he would raise his bread and seed. It came up, but it did not get much growth in the Fall, and in the Spring it was literally destroyed by the fly, so that he plowed it up; while his wheat sowed about the 10th of September, yielded 27 bushels to the acre. He has raised wheat about 40 years and never had any destroyed by the Hessian fly sowed from the 10th to the 15th of September. That is his experience, whether it is worth anything or not.

PRODUCTIVENESS OF OREGON AND FULTZ WHEAT.—John M. Stahl tells the Ohio Farmer how 20 acres of wheat yielded in that State the past season. Of this, 11 acres were in Oregon and nine acres in Fultz. The Oregon thrashed out 208 bushels, or very nearly 19 bushels per acre. The Fultz yielded 128 bushels, or a little over 14 bushels per acre. It will thus be seen that the Oregon yielded five bushels more per acre than the Fultz. They were sown side by side in the same field, and the Fultz was on slightly the better soil. In 1879–80 his Fultz was almost a total failure, while his Oregon made a fair average yield. The reader may think that 14 and 19 bushels are small yields. In a good year they would be. But Mr. Stahl is quite sure that, taking into account the entire acreage of wheat sown, the average yield per acre in his county was not four bushels. The RURAL'S experiment of two years with this wheat has been very favorable, as already noted. It bears a reddish chaff and is bearded. The straw is purplish and slender, but strong. The heads average but 2½ inches—six breasts, 2¼ kernels to a breast. But the grain is large.

THE following is sent to us, clipped from a Wisconsin paper—the name of which does not appear:—"C. C. Deits, of Minn. Junction, last Spring received from the RURAL NEW-YORKER one potato of the White Elephant breed, which weighed 1½ ounce, and he planted it in five hills. Last Saturday he dug from these five hills 33½ *pounds of potatoes*. They are all fine and large, not one of them being as small as the seed. At this rate it has been figured that on one acre of ground over 2,000 bushels can be raised." Ahem!

NOR is it unhealthy to eat pork on general principles, the blind prejudice of many to the contrary notwithstanding, remarks the Western Rural. We have been careful to observe during the last few years the effect of pork consumption upon those who ate a great deal of it, and we have no hesitancy in alleging that no better or more harmless meat than pork comes on to the American table.

CIDER MAKING.—A late meeting of the Farmers' Club, as reported in the Husbandman, discusses the best methods of cider-making. There are at least three or four indispensable requisites to making good cider. The fruit should be fully matured and fully ripe, and free from bitter, crabbed, unpleasant flavor, as the process of grinding and pressing cannot enrich or improve the natural flavor of the juice. Cleanliness is another indispensable requisite, as sweet cider is most sensitive to anything with which it comes in contact, and will take an unpleasant and ruinous flavor from musty or filthy barrels, or from apples that have been allowed to heat and mold by lying in bins or large piles, or by lying too long under the trees with grass growing over them, or by being picked dirty with leaves or other litter, or by being scooped from a dirty wagon-box, or if the straw used in laying up the cheese be musty or have any weeds in it, the cider will partake of the bad flavor. A half-dozen stalks of ragweed will flavor the cider from one hundred bushels of apples. . . . . It is of vast importance that the cider should come from the press with the least possible of pomace or sediment; hence the very great importance of the manner in which the apples are ground. . . . . Mr. Ketcham said, "I have repeatedly heard the assertion that cider would be better in large quantities, or large casks, than in small ones. My experience has proved this to be true. I have many times filled a five-gallon or ten-gallon keg with choice juice, and after particular care, invariably and in every instance its fine flavor was changed to a dead, sluggish sour, and it was consigned to the vinegar cask. In larger casks it is less exposed to air and fermentation is retarded. A cool place, even down next to freezing, is very essential in order that fermentation may go on very slowly. So kept, cider will increase in excellence all Winter. And now I may give it as my opinion, based upon my own experiments, that by selecting proper fruit, excluding everything that can impair, even the worm holes, and all that we would reject in eating an apple, we may have a drink that will compare favorably with the juice of any fruit that our soil produces."

S. M. Carr remarked that he fully concurred in the above. It is possible to get just as good cider from grated apples. The latter process makes more care necessary; the juice must be filtered. His way is to run it through clean gravel and straw. That strains out all pomace—at least all that can be arrested in the passage through a filter that may be close enough to permit very slow draining if required, and he thinks makes the cider as free as it can be from crushed apples. It is true that the juice can hardly be made entirely free from pomace by any process, and pomace is injurious to cider. To make a good filter put about two bushels of clean gravel in a barrel provided with suitable holes in the bottom to let the juice drain; mix a little char-

coal in the gravel, cover with straw and charcoal and the thing is done. The gravel should be washed until water will run off clear.

When you come to an extra-good hill of potatoes, toss them out separately and pick them into a barrel, and save especially for seed. Will not this have a tendency to increase the the yield if practiced for a term of years?—Home Farm via Tribune. . . . . Henry Ward Beecher says:—"My father used to say: 'Henry, when you kindle a fire never throw an armful of wood on at once; that will put it out. Get some kindling that is dry and put one shaving on, and one more, and one more, and, little by little, you can build just as big a fire as you have a mind to.'" Mr Beecher certainly learnt the lesson well; for he has kindled several roaring fires during his eventful life. . . . . Among the cargo of the steamer Leipsig, which arrived at Baltimore October 22 from Bremen, were 8,000 heads of cabbage, imported from Oldenburg, Germany. This is said to be the first importation of European vegetables ever brought there, and is due to the high prices of home-raised cabbages. It is not long ago that the Rural was advising its Western friends to send cabbages to the New York market. . . . . The Herald says that 7,000 Morwomen are divided among 3,000 Mormen. . . . . The Lowell Citizen says that the man who went to work with a will was a lawyer. . . . . If you wish to be really happy take a good deal of out-door exercise and never run in debt. . . . . It is one thing to have a house to live in and quite another thing to have a home to live in. . . . . Professor Beal says that to be constantly giving information in science makes intellectual tramps, and not trained investigators.

Everywhere.

RURAL SPECIAL REPORTS.

Canada.

Brantford, Ont., Oct. 27.—The Washington Oats yielded 28 pounds; the White Elephant Potato 35 pounds—none very large. The Rural Branching Sorghum is not suited to this locality—grew about six feet high. The seasons are too short for a successful crop. Asparagus seeds were not sown until late, consequently they made little growth. I have 16 picotees and carnations and the remainder of the plants under *these names* are a mixture of Chinese and Japanese pinks, some of which have bloomed, but they have produced none equal to what I have. The pink seeds were pinks of all kinds, from the florist's pinks down, or, rather, up, to Heddewigii, double and single-fringed and plain. My pentstemons of a former distribution bloomed this Summer, and are very pretty. One iris also blossomed and was magnificent. Abies Sibirica succumbed to the heat and drought this year. The Cuthbert Raspberry has done well, producing a large quantity of strong canes for next year's fruiting. They stood our last severe Winter uncommonly well; thermometer at one time 32 degrees below zero. J. G.

Illinois.

Champaign, Champaign Co., Oct. 26.—If the climate of the valley of the Mississippi is one of intensities and extremes, it is at least one in which there is no end of compensations. After three months' heat and drought we had three weeks of moderate and refreshing rain, and now after the rains comes some of the most magnificent weather ever experienced. For four days of last week there were light frosts of a morning, but so light they killed nothing on the surface, but did change the foliage of trees so that they have put very unusually high-colored garments on. Then came two days of rain and then more such enjoyable and delightful weather it is difficult to picture it. The skies are a pure and cloudless blue; pastures, meadows and wheat fields, a vast stretch of living green; tree and shrub vegetation shows all colors from deep green to bright scarlet and from dark brown to pale gray—the temperature ranges from 50° to 60° at sunrise and sunset, and from 70° to 75° at noon; the winds are laid; and, in short, Indian Summer has come without the preliminary of frost or the storms which commonly usher it in. B. F. J.

McHenry, McHenry Co., Oct. 26.—We received the Rural seeds and gave the following a trial. Rural Branching Sorghum is doubtless all that is claimed for it; from the few seeds that came up it has branched out till the row is well filled and eight to ten feet high, planted on light, rich soil. Unless the frost holds off it will not ripen, but we shall give it another trial next Spring as we planted only a part of the seed, reserving some in case of failure. The White Elephant Potato contained 14 eyes and was planted in 14 hills, of which 13 grew and produced 18 pounds of potatoes, the three largest weighing two pounds. We think it an excellent yield considering the dry weather and the potato pests. This one-eye business has given us an insight as to the waste of planting so many unnecessary bushels to the acre. The flower seeds gave a fair show and the flowers are highly prized, being both new and beautiful. We shall have a grand display next year. I think we are more pleased with the seeds than we would be with a chromo, and you can count on our subscription another year, for we are meditating on that big corn, for this is the farm for corn, being oak openings under good cultivation. But wheat is almost a failure in this part of the country, it being so very light. This reminds me of a suggestion in a late Rural about cleaning seed wheat—if every seed was good the result would doubtless be a heavier crop of grain. Our first frosts, which were light, occurred on Oct. 19 and 21. Heavy rains now and warm weather. Corn and potatoes are plentiful in this section. Oats light; apples scarce. Butter, 30c.; eggs, 20c. I've just sold three dozen chickens at 6c. per lb.; $4, per doz. Sold 12 hogs for $5.50 per hundred. P. L.

Monticello, Pratt Co., Oct. 24.—From 20 hills of the White Elephant Potato I dug 35 pounds of Elephants. The oats I put into rich ground and they broke down. I have a fine bed of asparagus plants standing about one foot high. The flowers were a success; the Rural Branching Sorghum a failure. G. A. S.

Iowa.

Illyria, Fayette Co., Oct. 24.—After our long drought through July, August and up to the middle of September, the rain came and it has rained almost ever since; now it is raining every day and night. The wells are almost full; some are running over. Cellars where they are not drained are fast filling up. Farmers are getting badly behind with their work. Our corn crop is very good—about an average. Potatoes a good crop, but many of them have been dug in bad order; some farmers are complaining of their rotting in the ground. Wheat none; very little sowed; what there was, chinch bugs ate up entirely. Oats about two-thirds of a crop. Barley not very good. Fruit a light crop; hay and grass very good. Flax a poor crop. Farmers will do well here this year, because everything brings a fine price. Cream and butter are very high, in fact, the prices are up for everything the farmer has to sell. Corn and hogs are very high for this time of year. Fayette County farmers feel good. I cut my Elephant into 15 pieces, one eye to the piece and planted them in a drill 15 inches apart in the rows, and plowed them once, hoed them twice, and dug 70 pounds of nice Elephants, the largest one weighed 2¼ pounds, the next 1¾ pound; three 1¼ pound each; five of the largest weighed 7¼ pounds—beat that who can. We had some baked for dinner and found them very good. The asparagus is doing well. The flowers are the finest I ever saw. The Washington Oats were a failure. The Rural Branching Sorghum grew finely; but I cannot tell much about its wonderful qualities, as I went to York State and other places the past Summer, and when I came home it was five feet high and I cut it only once; cattle and hogs are very fond of it. W. H.

Mentor, Bremer Co., Oct. 22.—The White Elephant yielded 46½ pounds of tubers. Of the Rural Branching Sorghum nearly all the seed grew 10½ feet high. I have got quite a lot of ripe seed. If I had planted it as early as I might, nearly all of it would have got ripe: as it was, only the main stalks produced ripe seed. I did not plant until May 20. The hens got the oats. The pinks grew and were nice. Potatoes and corn are good; oats fair. It has rained about half the time for the past seven weeks; streams so high that mills cannot run; ground so wet we cannot plow. E. E. F.

Newell, Buena Vista Co., Oct. 24.—All of the Rural seeds were planted in my garden—black prairie soil, new land broken a year ago last June. The Rural Branching Sorghum was planted June 1; it grew six feet but produced no seed. The asparagus seed all grew; the plants are one foot high. The oats came up well and grew very fast; they rusted very badly; heads half smut; saved one quart; will try them again. The White Elephant Potato I cut into seven pieces and planted them June 1; they got no extra care; on October 1 dug five pounds of nice tubers. The flower seeds did splendidly; my wife and daughters say they are the finest they have seen. We have had a very wet Summer here. June, very wet; July, very fine weather; August and September, very wet; October, rain all the time; cannot do any farm work at all—no plowing or thrashing has been done yet, and it is too wet to husk corn as it cannot be hauled from the field. J. F. L.

West Branch, Cedar Co., Oct. 24.—The Rural seeds were received in due time last Spring, but the season was so late that no planting could be done till about the 5th of May. The medium-sized White Elephant Potato was cut into 12 pieces, with one eye in each, and planted in drills 12 inches apart, making 12 nice hills, which did finely till the bugs took them when they were nicely in blossom, and then, in spite of Paris-green, London-purple and hand-picking, they were ruined about the middle of August. However I got a good yield of small tubers, all of which have been saved for seed. The Rural Branching Sorghum was planted May 10 in three rows four rods long. It grew well from the start, there being 10 to 20 stalks about eight feet high to the hill. On August 8, I cut all but one hill, which was left to see if it would seed. I cut off the heads of this hill on October 15; the seeds were all hard, and the color of the heads was a brownish-green. I think the seeds are ripe. The cut stalks are now about four feet high. The asparagus seed did not germinate well, and the two months' drought was hard on it, but I will have plants enough for a pretty good bed. The Washington Oats were not planted. The flower seeds gave us some beautiful pinks, some very double and some single, but all beautiful. No carnations. The first frost of the season visited us October 18. W. A.

Kansas.

Walnut, Crawford Co., Oct. 21.—The sad drought of 1881 was broken here September 29 and was followed by heavy wind and rain storms. What corn was left on the stalks in the field was snapped off or blown down upon the ground, and the long-continued rain has prevented our farmers from getting into the fields to gather it; consequently the corn crop is very much damaged. Wheat, oats and flax that have not yet been thrashed, are also badly injured by the rain. About one-half of the hay, straw and fodder is ruined, and it will require a very careful use of feed, together with good warm shelter for our stock, to get them through this Winter. Since the rain set in our late potatoes took a fresh start, and if frost stays off two weeks longer we shall have a large crop of these tubers, as I never saw potatoes grow faster than they are doing now. B. G. S.

Maryland.

Rayville, Baltimore Co., Oct., 20.—The drought which began the first of July still continues; corn and potatoes about half the usual crops. A majority of our farmers are unusually late sowing grain this season. That which was sown early has come up very thin, and has an unhealthy appearance. A large acreage of rye is generally sown on account of the demand for straw by the numerous paper-mills which are located in this section. There are twelve of them within a radius of six miles and all use straw, with one exception. I planted the seeds of the Rural Branching Sorghum, on May 14, in ground prepared in the same manner as for corn. A large percentage of the seeds did not germinate. As it was planted in a row beside a patch of corn, it received the same cultivation as the latter; the growth was slow until July 1, when it grew off finely. On July 19, when about two-and-a-half feet high, I cut a few hills, containing from seven to eleven stalks each, about four inches above the ground. On August 4, the same hills were cut again about six inches from the ground and the cut stalks measured two-and-a-half feet. On September 1, it was again cut about eight inches above the ground and the stalks measured two-and-a-half feet; and on October 4, it was again three feet high when it was cut off at the ground, making a total growth of 10 feet two inches, in the driest season our "oldest inhabitant" remembers. That which was not cut at all grew seven feet high; the blades were killed by a severe frost on the 5th inst. It was then in full bloom, and I succeeded in saving enough seed to plant next year by covering the tops with paper bags when I thought there would be frost during the night. The frosts killed the blades but did not kill the stalks. I cut the tops off to-day and some of the seeds are filled with flour, while others are in the doughy state; but I think that with good attention they will all germinate. The cows and horses passed judgment upon it and pronounced it *good*. P. S. C.

Michigan.

Evart, Osceola Co., Oct. 22.—We had a dry Summer and Fall up to the middle of September. Since then it has been very wet. Crops have turned out very good except corn. Considering the drought, the hay crop was good, as the dry weather did not come on soon enough to hurt it. Late potatoes are turning out better than was expected in this neighborhood. I planted my White Elephant the 9th of May in good garden soil—10 eyes and pieces. I dug them September 8, and got 48 rather small tubers; the hot, dry weather killed the tops prematurely. The Rural Branching Sorghum I planted June 10; it grew rank, throwing out a good many suckers. I cut a part of it about the first of September, and the second growth was two feet high on October 1. I counted 57 stalks in one hill. What I did not cut grew about six feet high, but did not seed: my horses and cows ate it greedily. The Washington Oats grew finely and yielded well, but were badly rusted and there was a good deal of smut. My hens got at them and harvested most of them for me, but I have saved more than the original package for seed; will try them again. The flower seeds came up well and were *splendid*. Prices are: Wheat, $1.30; corn, 60c; oats, 50c; potatoes, 60@75c; butter, 28@30c. Now about the Beauty of Hebron Potato: I think it the best eating potato I have ever seen—with me it is 10 days or two weeks ahead of Early Rose; but I find some of them have a hard black spot in them. I gave some to a neighbor last Spring; he planted them on ground well manured and they were nice in size but were nearly all of them black inside. I planted some on new ground without manure and do not find many affected ones among them; the soil is sandy loam. Last year I thought it was on account of hot, wet weather, but that has not been the case this year. "But with all their faults I love them still." I am trying several new varieties this year. The asparagus seeds were soaked before planting, but only a few plants came up, and some of them not until this Fall. I think the good old Rural is doing me a great deal of good and I shall continue to take it as long as I live if I can get the money to pay for it. My father took the Genesee Farmer and then the Rural, and "us boys" when we got homes of our own took it—I have only missed one year in twenty, and think it improves with age and acquaintance. I am trying to have my neighbors subscribe for it. [Thanks.—Eds.] First frost Oct. 4. E. O. T.

Minnesota.

Hutchinson, McLeod Co., Oct. 24.—The season here has been remarkably wet, so much so that we cannot do our plowing or much other work. There will be a great deal of plowing to be done in the Spring. I thrashed my Washington Oats. I could not save more than half of the seed, but they are very nice—large grain and heavy. The flower seeds were very satisfactory. J. C.

St. Cloud, Stearns Co., Oct. 24.—We have had in this part of Minnesota almost continuous rains since last Spring, consequently some of our crops are not first-rate, notably wheat and hay. The grass was abundant, but the meadows were overflowed and the hay in many instances was totally ruined, and what is saved is generally in poor condition. This applies more especially to the natural meadows; the Timothy and clover hay is generally in good condition. The White Elephant Potato had 13 eyes. I divided the eyes and made 27 hills, or, rather, sets, as I planted them in a row 20 inches apart. I dug just 200 pounds, and I think at least 20 pounds rotted on account of the wet. We have tried them on the table and find them superb. I planted the Rural Branching Sorghum on May 22, 3½ feet each way. Just two-thirds of the seeds failed to germinate, but as I planted three seeds in a hill, I had enough to transplant and have one plant in a hill. Soil gravelly loam, manured with four wheelbarrowfuls of rotten barnyard manure, made principally from tame hay and wheat shorts and bran. I gave good corn cultivation with hoe only. There were from nine to thirty-two stalks from each plant. I did not cut it until the middle of September. It grew from nine to ten feet high. Seed did not ripen. The stalks were cut in the feed cutter and mixed with wheat middlings. The cows ate it well. In some sections of the country it is, no doubt, *the* fodder plant; with me I think sweet corn more profitable. The Early Marblehead Sugar Corn, the earliest I ever saw, had full-grown corn for table in 45 days from planting—the best early corn I ever had. The asparagus I could not plant; I intend to do so next Spring. The carnations were not carnations at all, but beautiful, nevertheless—very double and splendidly colored. L. I. Salter.

Nebraska.

Crawford Valley, Antelope Co., Oct. 22.—I planted Rural Branching Sorghum, May 10, on light sandy loam. *No manure.* It grew very nicely; seed did not ripen. Sowed Washington Oats and Mold's Ennobled, in drills side by side. Both grew well; like the "Ennobled" best. The Asparagus seed all grew nicely. The small White Elephant Potato with eight eyes I cut into eight pieces, making eight hills; dug 13½ pounds of rather small tubers; bugs destroyed the tops early; common cultivation, no manure; ground all quite new, only second crop. Corn a fair crop; wheat and oats failures on account of late Spring. A. B.

New York.

Moravia, Cayuga Co., Oct. 24.—The "dry spell" reached us this season in earnest. Never, in the memory of the oldest inhabitant, has it been so severe. Wells have become dry that have never been known to have failed before. Fruit is scarce. Oats a fair crop. Wheat below an average. Corn half a crop. Potatoes are better in some portions

than in others. Shipments of potatoes from this station in the month of September amounted to 10,000 bushels; thus far this month, they are being forwarded as fast as cars can be obtained to receive them, and thousands of bushels are in store awaiting transportation. The White Elephant I received made twelve hills, an eye in each; bugs very plentiful; product 17 pounds. The Washington Oats grew four feet high and yielded three pints of seed. Prices are: Wheat, $1.50; barley, 90c; oats, 50c; corn, 75c; flour, $4; butter, 30c; eggs, 25c; hay, $10; potatoes, 80c; hogs, 8c; beans, $3. G. W. S.

Ohio.

PLEASANT PLAIN, Warren Co., Oct. 24.—The White Elephants weighed two ounces and had 21 eyes. On April 19 I planted one eye in a hill in good garden soil; used old hot-bed manure and unleached ashes, well mixed. On September 15 I dug 16 pounds, some weighing a pound each. The weather was very dry. The Rural Branching Sorghum came up nicely. It was planted in drills, but too thick. I cut every other row; the suckers are now four feet high and 10 or 12 to each plant. The remainder is now 10 feet high, and there is a sucker to nearly every leaf-joint. Some of the heads are now ripe. The frost of the 20th did not affect it any. The Washington Oats were a failure—rusty. The asparagus seed did not propagate well—but few plants. The pinks are doing very well; some are in bloom. I obtained one pound of the White Russian Oats of D. M. Ferry & Co., of Detroit, Mich. They were planted in drills six inches apart, in garden soil. The product was 1½ bushel; four to six stalks from one grain. C. W. D.

Pennsylvania.

COLUMBIA, Lancaster Co., Oct., 26.—I had hoped to be able to make a report on the White Elephant Potato, that would go ahead of all others, but the severe and long-continued drought, cut the crop short. My son started the potato in the greenhouse—cut off the sprouts and soon rooted them, cut them off again and again, until he had five or six boxes, 12 by 18 inches, filled with growing sprouts, and hundreds of little potatoes, the size of peas, on the surface of the ground. After danger of frost was past he planted them out in a row 120 feet long. All started finely until the dry spell commenced in May; then they made little growth afterwards. Bugs, too, appeared determined to use them up. The several sprinklings of Paris-green bothered the bugs somewhat. His crop was 49 pounds of small potatoes. As to the Rural Branching Sorghum, I also planted a few seeds in a pot and afterwards planted out three plants. These soon started to grow and throw out sprouts, each plant eight to ten. The main stalk grew up eight feet, and the sprout six to seven feet high. All the seed on nine heads on each of the three plants ripened perfectly, and I now have about three pints of very nice seed. Now what shall I do with the seed? [We give your address, so that those desiring seed may apply. EDS.] As we farmers in Lancaster Co., Pa., have not yet got to the soiling system, we have no use for this kind of green feed, preferring to let our cattle pick their feed in the fields. The asparagus seeds came up well, but the drought soon finished them, as it did our cabbage, celery, and other garden truck. The flower seeds were nothing new or extra. Our wheat was a fair average crop; corn over half a crop; tobacco a medium crop, but of extra quality, free from flea-bites or worm holes. Light rains lately are bringing up the wheat finely; but springs and wells are not yet affected. J. B. GARBER.

GLENORA, Butler Co., Oct. 24.—The Washington Oats I drilled in good ground. They grew very rank, but smutted badly; I got half a gallon of good seed from them. From the White Elephant Potato I got almost a peck of nice tubers, which I thought a good yield, owing to the continued dry weather we had for so long a time. Potatoes are worth from $1@1.30 per bushel. The asparagus seed germinated and grew finely. The Rural Branching Sorghum was a failure; only a few seeds germinated. The RURAL pinks were beauties. I think the RURAL a worthy paper and hope it may long flourish. G. G. G.

Washington Territory.

KLIKITAT LANDING, Klikitat Co.—In this section wheat must be sown shortly after February 1, for in many seasons a crop of late-sown grain does not get rain enough to cause it to sprout. Experiments with the seeds you sent out this year show that the White Elephant hardly equals the Early Rose either for quantity or quality. The Rural Branching Sorghum is a real success. The Argenteuil Asparagus, fair; German Asparagus, almost a failure. The carnations have been a wonderful success and a real surprise, such a variety and so beautiful. The pinks have taken splendid roots and we are looking forward for a fine show next year. The season has been a favorable one for farmers. Growing crops have all about matured. Prices here are, per pound, wheat, 1c; corn, 2½c.;—a poor crop here; barley, 1c; oats. 1¼c; potatoes, ¾c; pork, 5@6c; beef, 3@4c; apples, ¾c; grapes 2@4c; peaches and n arly all kinds of small fruits abundant and prices low. G. W. B.

Wisconsin.

MINNESOTA JUNCTION, Dodge Co., Oct. 24.—My original White Elephant Potato weighed 1½ ounce. I planted it in five hills and dug 33¼ pounds of nice, large tubers—all larger than the one planted. I would not sell the potatoes for what three subscriptions to the RURAL cost. The asparagus also came up finely and has done well. Most of the carnations have blossomed and my "better half" thinks they are splendid. The Rural Branching Sorghum has done finely and I think I shall save some seed. The Washington Oats lodged badly, and half turned out smut. Crops are poor. The average yield of wheat is nine bushels; potatoes good; oats, middling; corn, a failure, on account of the white grub. Old meadows are all destroyed by the same pest. We are having rain almost every day and plenty of it. Ground too wet to plow or to do any work on the farm. Cows pay best of anything on the farm; we get 32 cents per pound for creamery butter. Fall seeding good on account of having so much rain. We have had but three frosts that amounted to much; they have not killed our geraniums in the garden. Not as much Winter wheat has been sowed as usual. I think it pays to take the RURAL NEW-YORKER, and you can count me as one of your life members as I am an old reader. I have bound copies in my library since 1871, so you see I am no stranger to the RURAL NEW-YORKER. C. C. D.

TROY, Walworth County, Oct 23.—Our crops, on the whole, have been rather poor; wheat yielded from three to twenty-five bushels; averaging from six to eight. Corn, early-planted, good where the grubs did not eat it; late, very poor; oats a fair yield, but light in weight. Potatoes the same as corn—early, good; late, very poor; half a crop. My White Elephant was small, but when cut with one eye in a piece, it made 16 pieces which were planted one in a hill: 14 grew and after taking out three tubers the rest weighed 34 pounds. The Rural Branching Sorghum did first-rate. I cut it twice to feed to my horses. I thinned and saved two hills for seed: it was cut last week before frost, and I think I shall have plenty of seed. After gathering the seed I cut the stalks and the horses devoured them greedily. The asparagus did not grow; the other seeds my wife gave to her sister. H.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

THE LATE IRISH LAND LEGISLATION.

W. H. N., New Brunswick, N. J., asks what advantages are conferred on the Irish tenant farmer by the Land Act lately passed by the British Parliament.

ANS.—Briefly summarized the new Land Act provides that every tenant shall be entitled to a lease of fifteen years; that expenditures for improvements shall go to his credit in giving him a property interest in his holding; that on the expiration of the lease he shall be entitled to compensation for this property, and if it is not paid, he shall be entitled to a new lease without change of rent; that in case of disagreements, rate of rent shall be determined by a special court called the "Land Court," lately created for the purpose of settling land questions; that in fixing rent, valuation is to be made on naked land; that no tenant shall be evicted except for non-payment of fair rent as fixed by the court; that the tenant may sell his property interest in the lease or improvements at any time, and that under certain specified conditions the tenant may become the purchaser of the land held under the lease, receiving aid from the government to do so, by a loan secured on the property and payable by installments within a certain limit of time. The Land Court has just begun operations and rendered its first decision last Wednesday at Monaghan. Before its recent suppression, the Land League made ample arrangements for testing the value of the new law, for tenant farmers, by bringing before the court a large number of cases where the rent was not very excessive, yet where a reduction was thought just. Such cases will now be tried without the aid of the League, and for some years to come claims for reduction of rents must form the vast majority of business before the court. Its first decision reduced the plaintiff's rent six guineas—about $31, on a small holding on which the rent was not high in comparison with that charged for other land of the same nature. The excessively high rent sometimes charged may be inferred from an application made to the Dublin Land Court last Wednesday to fix the rent on a holding in Cork where the Poor Law's valuation was £27 and the present rent £113. In spite of the Land League, an enormous number of tenant farmers are sure to seek relief from the court; 2,000 tenant farmers in the single county of Limerick have already resolved to apply to the court to fix their rent judicially or set aside unjust leases, while 11,000 applications are being prepared in County Clare.

THE FIVE-COURSE SYSTEM OF CROP ROTATION.

A. L., Westover, Md., asks what we think of the five-field system of rotation, and what rotation would be advisable where wheat and corn are the principal crops—soil mostly heavy loam, with a yellow clay subsoil; level. Clover and Timothy grow kindly, but oats are not a certain crop.

ANS.—This is a very important question, as it opens up the whole subject of the management of a farm carried on under the mixed system. Where wheat and corn are produced and some cows are kept, as well as a few head of beeves fattened each year, and a small flock of sheep is kept, the five-course or five-field system is the best that can be pursued. There are two fields in grass—one for hay and one for pasture; or both for hay if there is a permanent pasture on the farm besides the five fields, as there should be. Then the second or oldest grass field is plowed for corn, the corn stubble is put in to roots or oats or both with some potatoes. Wheat follows the oats or roots and is seeded with grass and clover. There are two fields of grass; one of corn; one of oats, roots and potatoes; and one of wheat, and these crops furnish some wheat, hay, potatoes, oats, butter, pork, wool, lambs, eggs and poultry for sale; and corn, corn fodder, hay, straw, roots, and some oats for feeding. There is no other system of farming which is so desirable or profitable as this when the character of the soil suits it precisely. A heavy loam soil, kept well manured by feeding as much stock as possible and buying bran or cotton-seed meal to help in feeding the straw, corn fodder and roots to cattle or sheep purchased in the Fall for this purpose, is very suitable and may be kept by good management as rich as a garden. The manure is all given to the wheat, being plowed in on the oat stubble and the potato ground; this insures good wheat and fine grass; this good sod makes certain a fine corn crop and a good oat crop following. We think there is no better system for such farms as are suitable to it.

ADVANTAGES OF AGRICULTURAL STATIONS.

A. S., Westover, Md., asks whether there is any means by which an ordinary farmer can tell about what percentage of potash and of other fertilizing materials there is in the muriate of potash ordinarily sold for agricultural purposes.

ANS.—No—not with any certainty. In those States which have agricultural experiment stations, such as Connecticut, New Jersey, North Carolina, etc., one of the most important objects of these institutions is to analyze samples of fertilizers of all sorts sent in by farmers from all parts of the several States. In this way the agricultural value of various sorts of manures, such as muck, ashes of different woods, marl, etc., is determined, and farmers can either employ them profitably if they are of real utility, or avoid the outlay of time and labor upon them if they are worthless. Unscrupulous manufacturers of commercial fertilizers are also prevented, to a great extent, from adulterating their goods through fear of detection and exposure through the stations. In those States where no such stations exist, it would often pay the farmers of any district to employ a competent chemist to make an analysis of such fertilizers as are largely used. In giving, from time to time, the analyses of fertilizers, made by the Connecticut and New Jersey Experiment Stations, our object is to show the composition of the analyzed fertilizers to our readers throughout the wide district in which those particular articles are used.

Miscellaneous.

E. L. W., Brooklyn, Pa., 1, sends two specimens of seedling apples to get our opinion as to the value of the fruit. The tree is 50 years old and enormously productive. Thereabouts the apple is known as Weston's White Apple. 2, How should quinces be raised from cuttings.

ANS.—1. It is an apple, in our judgment, of the finest quality and should be propagated and disseminated. 2. Take the cuttings now. Cut close to the old wood. Set them in a firm soil and press the earth closely about them, leaving only the tips out of the soil an inch or more. Cover with manure. Quince cuttings often fail in sandy soil. Keep them mulched during next Summer to preserve moisture. The following Spring they may be set where desired or in nursery rows.

W. H. Hapley, Mass., wishing to obtain the next number of the Journal of the American Agricultural Association, asks its price and where can it be had.

ANS.—The next issue will be very interesting and instructive, as may be seen by the bare list of its contents lately published in the RURAL. It will contain about 300 pages of matter by some of the best agricultural writers, and will cost only 75 cents per copy. It is now in press and will be ready for distribution in a week or two. Those wishing copies should address the Secretary and Editor, J. H. Reall, 127 Water Street, N. Y.

Subscriber, Glendale, Mich., asks, 1, will the Robbins Family Washer do what it is claimed to be able to do; 2, where can he get the Vergennes Grape.

ANS.—1. A number of notices of this washer have appeared from time to time in the "Domestic Department" of the RURAL, a few of which were unfavorable, but most of them spoke highly of it. After a good test at the Rural Farm it gave complete satisfaction. Probably a good deal depends on a careful use of it. 2. Thomas Calef, Bridgeport, Conn., advertised Vergennes Grapes for sale in the RURAL some time back.

W. M. N., Darien, Conn., asks, when is the best time to plant Black Walnuts; 2, the address of "The Advance."

ANS.—1. When the nuts are gathered for planting they should be laid in heaps on dry ground and covered with straw or sods on which should be piled earth enough to exclude water and prevent alternate freezing and thawing. In Spring they may be planted in ground marked out, in rows four feet apart. 2. The New York office of The Advance is No. 60 Bible House. It is dated and published here and at Chicago.

T. L. P. C., Cartersville, Va., says that six years ago he manured his orchard with about 35 loads per acre of stable and pig-pen manure, and ever since his apples have been more inclined than formerly to rot on the trees, and less disposed to keep well, and he asks for some preventive of rotting.

ANS.—Perhaps the soil was rich enough before the application of the manure. Any stimulant that excites an undue growth might cause fruit to rot. But the trouble should remedy itself. Root-pruning might be effective.

J. G. S., Ellinwood, Kan., asks the address of the Iowa Horticultural Society with a view to getting its 36-page pamphlet giving explicit instructions in the propagation, setting and management of forest trees on the prairies, which Professor J. L. Budd, in the RURAL of October 15, said would be forwarded to applicants on the receipt of a three-cent stamp.

ANS.—Prof. J. L. Budd, Ames, Iowa, is Secretary of the Society and Editor of its publications. Applications should therefore be made to him.

W. C., Sparta, Ill., asks for a description of Rea's Mammoth Quince.

ANS.—Rea's Mammoth resembles the Orange or Apple Quince in form and color, but is one-third larger. It is large, roundish, shaped like an apple, and of a fine golden color. The tree is a strong, thrifty grower, and moderately productive. The leaves are longer and darker than those of the Apple Quince.

J. F L., Newell, Iowa, asks whether the RURAL'S Dent corn will mature as far north as that latitude.

ANS.—We should doubt it. Better try the Rural Thoroughbred.

L. P. Stevens, Norfolk, Conn., wants to know where he can obtain trees of the Marshall Pear recently illustrated in the RURAL.

ANS.—From P. H. Foster, Babylon, Long Island, N. Y.

S. W. McLachlan, Miss.—The present, for your section, is probably as good a time as any to plant asparagus roots. Other questions will be answered under Domestic Economy.

S. H., Pewaukee, Wis., sends a stalk of grass for name.

ANS.—It seems to be Hungarian Grass.

FOR OWNERS OF BATES SHORT-HORNS.—A "Subscriber," Chesterville, Me., wishes to learn through the RURAL who has for sale a Short-horn bull of Bates blood. He says: "Will not object to color, nor if he is cross (sic,) if he comes cheap enough and is high-bred enough to make it pay."

THE
RURAL NEW-YORKER,
A National Journal for Country and Suburban Homes,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, NOV. 12, 1881.

SEVEN YEARLY SUBSCRIPTIONS WITH $14 ENTITLE THE SENDER TO THE RURAL NEW-YORKER FOR ONE YEAR FREE.

WE would remind those who kindly propose to solicit their acquaintances to subscribe for the RURAL NEW-YORKER for another year, that the present is really in some respects a more favorable time for such endeavor than later in the season. The weather is now generally more pleasant than in December and January and the competition from professional agents far less keen. We beg to say that we shall at all times be very glad to send posters and specimen copies for this purpose (including the Fair Edition) free of all charge to all who apply. Moreover, to each new subscriber for 1882, who subscribes before New Year's Day, we will send the RURAL NEW-YORKER *free* for the remainder of 1881, beginning with the first issue after the receipt of his subscription.

WE ask every subscriber, now that the subscription season for 1882 is upon us, to speak of the RURAL NEW-YORKER to his neighbors and friends in such terms as he may think it deserves. Such words have more effect than anything that the newspaper agent or advertisements can state. We respectfully submit that our friends may in this way serve the cause of agriculture, the true interests of which the RURAL professes to have at heart.

WHITE GRUBS as they are commonly called—the larvæ of the May Beetle—are becoming the most formidable of our insect pests. The worst of it is that no practical means of destroying them are known; for we deem the method sometimes advocated—that of destroying vegetation by frequent plowing and thus starving the grubs to death -quite impracticable. Upon our strawberry beds we have applied sulphur, salt and hellebore in as large quantities as we dared; nevertheless, the grubs are at present quite as destructive as ever.

POTATOES are rotting badly in the RURAL FARM country, Long Island, N. Y., and farmers are getting rid of them as fast as possible. The same state of things exists about the RURAL EXPERIMENT GROUNDS in Bergen Co., New Jersey. In view of this, we should advise those of our Western readers whose potatoes are keeping well to hold them. Potatoes imported from Ireland are now selling in this market—for the first time within our remembrance, or that of "the oldest inhabitant," within our acquaintance. A couple of years ago during the period of Irish distress, America presented a large quantity of potatoes for seed to the Emerald Isle, and now the progeny of these have come to their ancestral home bringing several native varieties with them.

THE Mock-Orange illustrated on page 763 of this issue—re-engraved from the London Gardeners' Chronicle—is often called syringa, which is the botanical name for the lilac. The name of Mock-Orange is also misleading since, aside from a faint resemblance in the odor of its flowers to those of the orange, there is no resemblance or relationship. Philadelphus is its botanical name, and it were better to make that its familiar name as well. Let us assure those of our readers not acquainted with this old-fashioned plant that it has claims to rank among the first of our hardy shrubs. It begins to bloom in early June and its flowers are beautiful, fragrant and borne in profusion. It is extremely hardy—it thrives in almost any soil or situation, and grows to the hight of from six to ten feet.

THE PROPOSED NEW YORK EXPERIMENT STATION.—A meeting of the organizers of this project was held the other day at Albany, but beyond the closing of the career of the old Board of Control and the inauguration of the new Board, nothing was done. However good the intentions of the old body, it was unable to do anything decisive towards establishing the station, and it is certainly to be hoped that its successor will have better luck or more energy. About two years have now elapsed since the appropriation of $40,000 to meet the expenses of the Station for the first two years. That any doubt should at any time have been possible as to legality of the appropriation reflects small credit on the friends of the measure in the Legislature. Surely there has now been time enough not only to remove all doubt on this point by appropriate legislation, but also to have at least started the Station. The farmers of the State expect the new Board of Control to take prompt action in the matter.

WE have been censured by a number for giving expression to the opinion that "Golden Grains" and Black-bearded Centennial Wheats are the same. The doubt, however, seems now to have been removed. We have no reproach to cast upon S. Y. Haines & Co., of Philadelphia, and are willing to suppose that they were imposed upon and that in selling Golden Grains as a new wheat, they did not know it was Black-bearded Centennial. It is our duty, as it is our pleasure, to expose such mistakes whenever we are enabled to do so, notwithstanding some firm or individual may suffer pecuniarily thereby. Black-bearded Centennial, as our readers are aware, took the first RURAL NEW-YORKER premium, the kernels of the average head sent by Professor Blount, of Colorado, weighing 107 grains. Where, as in Colorado, it thrives well, either as a Winter or Spring wheat, it must yield heavily, as the kernel is very large and the spikelets grow close together. From the appearance of the grain, however, we should not suppose it would make good flour, though, as to this, little if anything is known.

IN a private note, Professor Beal of the Michigan Agricultural College says:—"Our Bermuda Grass has spread and grown wonderfully this year." He proposes to bury a little to keep it. Late in June Prof. Beal received some rhizomas of Johnson Grass. It has done well and ripened seeds. How far North the roots of this grass will prove hardy has not, as yet, been ascertained that we have heard of. The late M. B. Batcham wrote the RURAL six months previous to his death, that he thought they would prove hardy in Painesville, Ohio, where in his own grounds he was testing it. We saw this grass (Sorghum halepense) growing in a garden at Aiken, S. C., where the rampageous root-stocks were fast taking possession of the soil to the exclusion of all else. Our readers will remember that this Johnson Grass was much talked of three years ago as "Green Valley Grass." It was illustrated in the RURAL NEW-YORKER of April 24, 1880. The root-stocks are perennial and endure any amount of drought. It may be cut several times in a season and is relished by stock either as green food or hay. As to the Bermuda Grass at the RURAL FARM, we may say it is still green and growing rapidly. It has blossomed freely all Summer though no seeds have been formed.

THE ATLANTA EXPOSITION.

A GREAT and lasting benefit which the South will derive from the Atlanta Exposition will be the revelation of itself to itself, or, in other words, the revelation of its own resources and capabilities for industrial advancement, which have not heretofore been fully recognized or appreciated. The "Dark Ages" of the South are past; a new era of industrial prosperity has dawned; new ideas and new methods are superseding the old, and the immediate and highly important question for the industrial classes of the South now to determine is, How shall we obtain the most and best crops with the least outlay? The present exhibition will do much to place the Southern planters in a new and true light before the people. It will show not only that the South *has* produced goods of such a nature and such quality, but also that there are undeveloped resources which, in the near future, will be developed, if the new spirit of enterprise which is now exhibited be lasting, as no doubt it will. While we look with pride on the rapid advance which has been made throughout the country in industrial and mechanical improvement during the last fifty years, the South seems not to have kept pace with the other sections of the country; but the progress which it is destined to make in the next half century, will, we believe, surprise even the most sanguine. The Atlanta Exposition is the right thing at the right time, and its success will not be measured simply by the extent of the display, but rather by the stimulative effect which it will have upon Southern industries.

A GLANCE AT THE HOG CROP.

THE Summer hog packing season, including the eight months from March 1st, to November 1st, having closed, a brief review of the work done is in order. Special reports from all the packing points in the West show that the number of hogs packed through the season amounted to 4,772,934 against 5,323,898 for the same period last year—a decrease of 550,964; while for the twelve months closing with October 31, the decrease was 580,000, the aggregate for the past year being 11,695,000 against 12,275,000 last year. Chicago falls short about 270,000; Indianapolis, 215,000; Cleveland 90,000, and St. Louis and Cedar Rapids, Iowa, 60,000 each, while at several other points the shortage is smaller. On the other hand, Cincinnati has gained about 35,000, and Milwaukee 25,000, while Omaha has packed nearly 50,000 against none last year. The ill effects of the European movement against American hog products are shown very plainly by the statistics of our exports during the past twelve months. From November 1, 1880 to March 1, 1881, our exports were 110,000,000 pounds more than during the preceding Winter packing season, yet now, at the close of the Summer packing season, there is a decrease of 170,000,000 pounds in the year's exports as compared with those of the previous twelve months.

This shows that since the first of March our foreign exports have been 280,000,000 pounds less than during the corresponding eight months last year. This falling off is equivalent to the dressed product of about 1,600,000 hogs since March 1. As the decrease in the number of hogs packed during the Summer season was 550,964, and the decrease in our exports for that period equal to 1,600,000 hogs, if the former number be taken from the latter we shall actually have an increase of the product of upward of 1,000,000 hogs for home consumption or storage during the last eight months as compared with the corresponding period last year. During the past season the prices of hogs have been much higher than during the summer season of 1880, though the animals have averaged somewhat lighter. At present the average prices of hogs and hog products at Chicago, the principal hog market in the country, as compared with those at the corresponding date last year, are:

	1881	1880	Increase.	Per cent.
Hogs	$6.25	$4.65	$1.60	32
Mess Pork	16.50	14.00	2.50	18
Lard	11.40	8.10	3.20	40
S. C. Sides	8.70	7.15	1.55	21

The average weight of the hogs received at that point last month was 242 pounds against 247 for October 1880.

Now a few words as to the prospect for prices during the Winter packing season, which begins to-morrow, Tuesday, November 8, at Chicago. The State Auditors of Ohio, Indiana, Illinois, Iowa, Missouri, Kansas and Nebraska furnish annual statements of the number of hogs reported to them for taxation, and these statements put the hog crop of 1881 at about 800,000 less than that 1880. All of them report a decrease except Missouri which reports 3,639,279 this year, against 3,369,279 last year, making an increase of 270,000. It will be noticed that the figures are the same, but the 3 and 6 in thousands are transposed. Inasmuch as all other reports from that State go to show a decrease in the number of hogs this year, there is certainly a mistake in this return. Considering 270,000 as a decrease instead of an increase, the total decrease in the above seven States this year would be about 1,300,000, and it is not unfair to conclude that there will be a corresponding falling off in the other States which produce a far smaller proportion of hogs, so that the aggregate decrease cannot be far from about 2,000,000 head. Although the hog crop is short, however, it is not unlikely that owing to the deficiency in the corn crop and the high prices for both hogs and corn, farmers will push their hogs to market early in the season, to save their corn, in which case prices are pretty sure to fall until the supply becomes lighter.

BREVITIES.

THE year 1881 has been so short that we have scarcely grown accustomed to writing it. And now we must prepare for 1882.

ATTENTION is called to the communication of A. J. Caywood in the Entomological Department, as of importance to peach growers.

B. F. JOHNSON remarks, truly enough, in another column, that a very fat corn-fed hog is little more than a ball of lard and grease.

Send for the Fair Number of the Rural New-Yorker and the new poster for 1882. *Both will be forwarded* gratis *to all applicants.*

THE appointment of Mr. F. D. Coburn as Secretary of the State Board of Agriculture of Kansas, in place of Mr. J. K. Hudson, seems to give very general satisfaction. Mr. Coburn is spoken of as a thorough farmer.

WE have raised quite a number of philadelphuses (Mock-Oranges) from seed, but no changes either in flower, leaf or habit have been noted. Seed collected now and sown in pots will soon germinate. See Mr. Falconer's article, p. 763.

IN the last article on the Dairy Cow, page 746, cuts 508 and 509 were transposed at the last moment before going to press, and it was forgotten to make the corresponding changes in the text. Accordingly where reference is made in the text to Fig. 508, it should have been 509, and *vice versa*.

ACCORDING to experiments made at the Illinois Industrial University it appears that the safest way to secure the full benefit of either the Early Amber or Orange Sorghum cane crop for sugar manufacture, is to begin cutting the canes when the seed is in the "dough," and to grind them as soon as possible after cutting. It seems to Professor Morrow that the manufacture of sugar from sorghum is the most promising new branch of agriculture for Illinois.

A new Society has just been formed at Burlington, Vermont with the brief title "The Vermont and New York Lake Shore Association for the Promotion of Agriculture and the Mechanic Arts." Its promoters are enterprising men in Western Vermont and Northeastern New York who have decided to fix its capital at $25,000, and subscriptions, it is said, are pouring in satisfactorily. One of the foremost objects of the Association will be to hold an annual fair at Burlington, as it is alleged that ever since the State fair has been held elsewhere it has not prospered, while it was always a success when held at Burlington.

WHILE until the past week the East has been suffering severely from drought, the West has been suffering grievously from a deluge. Both conditions have equally retarded Fall work on the farm; but in addition to this, the Western down-pour has inflicted heavy losses on the farming community by destructive floods along the river bottoms and damage to unthrashed grain. Dalrymple, the Dakota wheat king, for example, had thrashed one-third of his wheat before the wet weather began, but the remainder, he says, has been injured to the extent of one to three bushels per acre and one or two grades in quality, the loss being 15 per cent. The aggregate of a loss anything like this over a wide territory, would be enormous.

PROBABLY there is no country in Christendom in which the condition of the peasantry is so wretched as in sunny Italy. Not only have they generally to drag out a hard, cheerless existence on the scantiest and poorest fare, but they are often subjected to the most galling humiliations—or what would be humiliations if centuries of oppression had left them spirit enough to feel indignities. Last year the prefect of one of the chief cities, an owner of extensive vineyards, obliged his laborers to wear iron masks during harvest time to prevent them from eating the grapes. This barbarous custom has been in vogue in some parts of Italy ever since feudal days, and although it was denounced by the newspapers last year, it is still practiced—and that prefect is still in office.

OWING partly to the high price of wheat and partly to the scant supply of it, a large number of flouring mills are shutting down in the Northwest and as far south as St. Louis. At the latter milling center fully half the mills—and the largest among them—have suspended work, and the same is the case at Milwaukee. The stock of flour throughout that section, too, is so very large that it is desirable to reduce it, and it is said that a lower wheat market in Ohio and Indiana is enabling the millers of these States to take almost exclusive possession of the Southern trade. Mills at interior points in Illinois and Iowa are reported to be buying considerable supplies of wheat from Chicago and St. Louis, which shows either that local supplies are inadequate or that the farmers are holding their grain for considerably better prices than those now ruling at the collecting centers.

GOVERNOR CULLOM'S PROCLAMATION against the importation into Illinois of cattle from those sections in which some herds are reported to be infected with pleuro-pneumonia in Connecticut, New York, New Jersey, Pennsylvania, Delaware and Maryland, is a timely and praiseworthy measure, if the grounds on which it is based are real. The Treasury Cattle Commission at first recommended that the entire States should be scheduled in any part of which the disease existed; we protested against such an embargo as too sweeping, and we are pleased to see that Governor Cullom has prohibited importations only from the infected counties, thus greatly diminishing the embargoed area. It is not unlikely that the constitutionality of the act of the Illinois Legislature authorizing his action, will be tested before the U. S. Supreme Court. For our own part, in view of the urgent need of effective legislation for the protection of live stock from contagious diseases, we trust the act will either be sustained or not questioned.

Scientific.

THE DRIVEN WELL TROUBLE.

THE tube or driven well controversey appears to be exciting a very unusually lively interest among farmers throughout the country just now. Messrs. W. D. Andrews & Bro., the owners or agents of N. W. Green's patent, appear to be extraordinarily busy collecting "royalty" from the owners of driven wells everywhere. In this State alone between 1,000 and 2,000 well-owners who have refused to pay $10 royalty for each well of the kind, have been summoned from all quarters to appear before the U. S. Circuit Court at Utica in a few days. To do this personally must entail heavy expense for travel, loss of time and hotel expenses; to appear by counsel must entail an outlay nearly as large as the claim for "royalty," even if the harrassed well-owners of each neighborhood should club together to defray expenses. A judicial decision against the claims for "royalty," however, would be a compensation for the annoyance and loss of time and money; but judging from the issue of half a dozen, or so, cases which have been already brought to trial before the U. S. Circuit Courts, a favorable decision can hardly be expected from these tribunals, each of which appears to feel bound to follow the precedent set by any other. A careful review of the case, however, leads us to believe that an appeal to the United States Supreme Court would be much more likely to free the driven-well owners of the country from the annoyance and exactions to which they are subjected. The expenses of such an appeal, however, would be so heavy that they could only be met by contributions from all those interested in upsetting Green's patent. Whatever the decision of the Supreme Court, the following truthful sketch of the early history of the driven well clearly proves that equity certainly does not require that the public should be heavily taxed to reward the individual talent, outlay or labor involved in the invention of this method of well-making.

The essential difference between the immemorial dug and artesian well, and the modern tube well, is, that in the two former the earth removed from the hole is brought to the surface, while in the last it is forced aside by a pointed drill driven down to the water-bearing strata. With a few rare exceptions, this drill consists of an appropriate length of wrought iron pipe, perforated at the bottom, and tipped with an adjustable, conical point, having a short stem fitting into the tube and a circular shoulder projecting slightly beyond it. When the perforated part has been submerged in the subterranean water a pump is attached to the upper end, and henceforth the tubular drill serves both as a curb to the well and a suction pipe to the pump.

The earliest account published in the country of the tube well-process of well-making occurs in an American reprint of "Mac Kenzie's 5,000 Receipts," issued in Philadelphia in 1829 by Jas. Kay, Jr. & Bro. On page 388, a recipe "to raise water in all situations," tells us that the finest springs may be formed by forcing an iron rod into the ground, withdrawing it on reaching water, and inserting in the aperture a pipe for the passage of an abundant stream. Apart from the suggestive heading of this recipe, it is likely enough that flowing wells were chiefly, or maybe, exclusively contemplated by it; but the process of making a well, not the method of getting water out of it, is the question involved in Green's patent; and the process described in his specification and covered by his claim is substantially identical with that set forth in Mac Kenzie's antedeluvian recipe-book. Of this household work three large editions had been scattered through the country, before the process clearly advocated by it, first occurred to Green's inventive genius in 1861.

During this year the rumored death of some of our soldiers, by drinking from poisoned wells in Virginia, caused much speculation among the troops about to visit the hostile territory as to the best method of obtaining pure water. At this time Green, who had been educated partly at West Point, was the colonel of a volunteer regiment quartered near his home in the village of Cortland, N. Y. During a discussion among the officers of the regiment on the hydraulic problem, the Colonel suggested that water might be obtained by inserting a tube into a hole made in the ground by an iron bar, and directed one of his lieutenants, named Mudge, to make the experiment. The spot selected for this was on the margin of a neighboring stream. An iron bar was worked down a short distance by lifting and dropping it alternately. On its withdrawal the water rose to within a few feet of the brink of the hole into which a common tin boat pump was then inserted, and an attempt made to pump it dry. Contrary to general expectation this was found to be utterly impracticable, for the water of the adjacent stream swept through the thin barrier of intervening sand into the vacuum produced by the action of the pump.

By Green's order Mudge continued, for some time, his experiments with this unsatisfactory result. In every case a "drive rod" to make the hole was indispensable. To ascertain when this had reached water, repeated withdrawals were often necessary. The fall of loose earth, sand and pebbles from the sides of the empty hole added annoyance and delay to increased labor. Moreover in loose, friable formations there was always danger of the entire work collapsing whenever the rod was withdrawn. Into this rickety hole a sheet-iron cylinder was gingerly introduced to serve as a wall to the well, and a guard to an inner lead-pipe for the passage of the water. The entire operation was more complicated, hazardous and uncertain, and hardly less expensive than the old mode, and not a single well sunk by Mudge under Green's direction turned out a permanent success.

IN October 1861, Green's regiment went south; but Mudge returned home in the following January, and two months later was followed by Green who had been dismissed from the army for shooting the Major of his regiment. This deed brought upon him much public opprobrium and imbittered the three or four ensuing years of his life by the legal proceedings to which it gave rise. This worriment, however, was not without subsequent compensation. In it he found a valid legal excuse for four years' negligence in asserting any claim to the invention of this process, and also for his marvelous ignorance of the public use others were, meanwhile, making of the discovery, a knowledge of which, without a protest, would have nullified his tardy claim to patent, in 1866.

After his return Mudge drove a few wells on his own account, but speedily tired of the profitless occupation and sought more remunerative employment, whereas Green, all whose labors in the matter had hitherto been pleasantly vicarious, took no further interest in it now that a prosecution of it would have involved personal exertion and outlay. His legal embarrassments, indeed, left him little money and less heart for experimenting in a sordid occupation for which his education had naturally given him a gentlemanly contempt.

Meanwhile James Suggett, an old well digger of the village, who had been hired by Mudge as an assistant in his early experiments, continued to drive an occasional well whenever he could contrive to get an order for it. Such an order gladdened his heart in September 1862, yet it sorely puzzled his head how to fill it. The well-making business had of late been dull and unprofitable, and the old man's funds eked out by his credit could not purchase a sufficiency of tubing. In the previous May he had begun to substitute gas-pipe for sheet-iron as a well-curb, and in his present impecunious dilemma the ingenuity in makeshifts, born of galling poverty, urged an escape from the expense of lead pipe by the use of a single gas pipe to discharge the combined functions of the two tubes hitherto deemed essential to success. At the same time a fortunate difficulty in obtaining the loan of a "drive rod," suggested another tentative innovation. By forging to a point the end of the gas pipe which his limited means had purchased, he transformed it into a stout tubular drill, and thus, all unconscious of the ultimate results of his labor, insured the permanency of the process, and forged the instrument that was presently to open the way to his own rapid enrichment.

The well constructed under these difficulties was the first brilliant success, and Suggett's makeshift expedient soon came to be regarded in the light of provident improvement reflecting no small credit on his inventive ingenuity. Thirteen months later, in September 1863, he filed an application for a patent covering his tubular drill, its point and perforations, and on the 29th of the following March this patent was granted. No sooner had Suggett obtained it than he hasted to sell territorial rights under it, before its value could be lessened by rival claims, or infringements.

In those restless days of flush pockets, and feverish speculation, tube well rights soon became popular as investments among those interested in domestic hydraulics, as oil well stock among the general public. Hence Suggett's luck differed as much from that of ordinary patentees as his method of invention. From the first he found a ready sale for his rights and presently investors flocked to him with nearly as much eagerness as ordinary inventors exercise in searching for them. Ere the close of the year the piecemeal sale of his entire patent had lifted the lucky well-digger from indigence to affluence, and lodged him snugly among the capitalists of the village.

His financial success, quite as much as the obvious shortcomings of his crude but suggestive devices, soon flooded the country with auxiliary patents, covering a few needed and a host of superfluous improvements. Of these some substituted an adjustible point, of various shapes and materials, for Suggett's clumsily forged makeshift. Others excluded sand from the suction pipe by screening its perforated end internally or externally, with wire-gauze or minutely perforated sheets of different metals. Suggett, with characteristic simplicity, had imperfectly accomplished this during the process of driving by economically packing the perforated end of the drill with rags to be fished out with a hook attached to the end of a long rod, when water had been reached. The bulk of these patents, however, differed from each other merely in trifles so absurdly immaterial that imposition not improvement must have been the aim of their owners. Of tube wells throughout the country fully four-fifths have already contributed in their cost to the price wrung from well-drivers for territorial rights under some one of these patents.

It was not in human nature that that Mudge should witness Suggett's rapid enrichment without attempting to profit in like manner by the scheme which it was now exasperatingly evident he had himself abandoned prematurely. Accordingly in August 1775 he applied for a patent for MacKenzie's process of well-making, and this was readily granted on the 24th of the following October. Six months' trial, however, demonstrated the fatal advantages of the pointed and perforated drill protected by Suggett's patent, all claims to which he had frankly repudiated in his own application. Finding, however, that his patent, in its present form, was useless, and still worse, unsalable, he surrendered it on the 5th of March, 1866, and boldly sought an amended reissue covering a perforated pipe and point in addition to the process claimed in his surrendered patent.

By this time Suggett's success and the widespread use of the system that had sprung from it, had roused Green to a lively sense of the vast possibilities of fortune still latent in the novel enterprise. Mudge's early experiments ordered by him were constructively his; and Mudge's late patent gratuitously proved that a process of making a hole in the ground was patentable. Suggett's application had embraced a claim for this which the underlings of the patent office had so unfeelingly ridiculed that his agent—Hon. R. H. Duell, Congressman from Onondaga Co., in those days and Commissioner of patents later on—prudently docked the instrument of this pretention. Yet Green might well have hesitated about contesting Mudge's conceded claims had not the latter voluntarily resigned the vantage-ground of possession. On this missmove his alert rival filed, 12 days later, an application for a patent for the process of sinking wells by forcing down a rod into the water under the ground, then withdrawing it and inserting in its place a tube, perforated but not closed at the bottom, for the purpose of extracting the water. This process was identically the same covered by Mudge's surrendered patent, and substantially the same described in Mac Kenzie's ancient repertory. In view of the reciprocal infringements of the rival claims of Suggett, Mudge and Green, the Patent Office, on the 31st of March 1866, declared an interference between the three. After three diverse decisions, as many successive appeals, and 22 months' litigation, the U. S. Court for the District of Columbia finally decided that Suggett's patent and Green's claim were equally valid, and that the luckless Mudge had no rights which the Patent Office was bound to recognize.

Without money to introduce his patent, Green at an early day made an agreement with an extensive manufacturer of iron pumps, whereby, for a certain consideration, in selling his patent rights he insisted on the exclusive use of the pumps of this manufacturer. Straightway the other pump manufacturers combined to test the validity of the patent. The case, however, was decided against them in 1876, and although they talked a good deal at first about taking an appeal to the Supreme Court of the United States, they have hitherto made no movement in that direction. Several other test cases have been tried before U. S. Circuit Courts in various parts of the country, but as there was no new evidence as to the use of Green's, or, rather, McKenzie's, method of well making before 1861, the Courts in every case have followed the precedent set at the first trial. At no time has the country been so thoroughly ransacked as it is at present for fresh evidence to invalidate the patent. In the absence of such evidence we are sorry to be compelled to own that we can see no probability of upsetting the patent otherwise than by an appeal to the United States Supreme Court, and there the issue would be very doubtful. Much as we would desire to free the farmers of the country from exactions made under this patent, truth and a regard for their best interests force us to make this declaration. We are now investigating the subject and beg of our readers to forward to us any new information they may have of the matter, and in order to post them thoroughly on what has already been ascertained we shall return to the subject in our next issue, or so soon thereafter as we shall have collected the information for which we are now searching.

Miscellaneous.

THE RED RIVER VALLEY.

Another Letter upon its Soil, Products, Cities, Towns etc.

MESSRS. HOLMES AND SWEETLAND.

[Special Correspondents of the RURAL NEW-YORKER.]

OCTOBER, which to more southern climes means the sere and the yellow leaf, here in the Red River Valley, brings the frosts which strip the trees of their variegated foliage, not in pairs, but in perfect showers, dropping to earth to become a part of the enriching soil. The portion of the country considered in this letter lies in the very heart of the great wheat-growing region of the Northwest; the land made famous by that grade of Spring wheat termed "No. 1 Hard," which has become of such value through the introduction of roller flouring mills. The counties through which we journeyed to obtain the data for this letter, were parts of Polk and Clay in Minnesota and parts of Grand Forks, Trail and Cass in Dakota. These counties will contribute this year not less than 6,399,100 bushels of No. 1 wheat which at the prices at the time of writing ($1.35) would give the farmers of this district $8,728,775. From an able article from the pen of J. S. Hansen we quote. "The peculiarities this year have been a lack of rain during the growing season when it is usually abundant, and an excess during what is generally the harvest season. In order to learn the effect in the remarkable wheat region I made a trip. The wonderful soil which enjoys a world-wide reputation, has fully maintained its high renown, even under adverse circumstances, and the result of the harvest just closed stands a new and strong argument in favor of its wonderful productive capacity."

We have made close and careful investigations and fully concur in the statements made. Many farms are yielding a larger average to the acre this season than last, and while the general average may perhaps be somewhat less, it will be on account of the lack of proper cultivation on the part of the farmer, or else neglect in seeding or thrashing.

Upon the branch of the St. Paul, Minneapolis and Manitoba R. R. running north from Fargo to Grand Forks have sprung up several smart and active little towns. The largest of these is Hillsboro (formerly Hill City.) It was named for General-manager Hill of the Manitoba line who has large landed interests. Last November it was platted, a fact which seems incredible as we look now upon its 400 to 500 population. There are two large elevators, hotels, a dozen stores, lumber yards, a good newspaper, a school and many business interests. It is ten miles west of the Red River, on Goose River in the very heart of the wheat lands of this valley. Buxton (52 miles north of Fargo, named for T. J. Buxton of Minneapolis) is another handsomely located prairie town. It is a good trading point and already has two elevators, two stores, a blacksmith's shop, a depot, two lumber yards and a really first-class hotel which has made it noticeable as a sportmen's resort. Another elevator and a schoolhouse are on the *tapis*. As to prices or local interests we refer readers to Budd Reeve Esq., of Buxton.

Grandin is a new but promising town 28 miles north of Moorhead and Fargo, named from, and situated near, the great wheat farm of the Grandin Bros., who are part proprietors. All branches of business are needed and its location should insure it a considerable grain market. Messrs Comstock and White, of Moorhead, kindly volunteered information concerning this section much of which space precludes mentioning. Our next stop was at those well known western cities.

FARGO AND MOORHEAD

the dual cities—so called on account of their location and conflicting interests. Fargo is upon the west and Moorehead upon the east bank of the Red River, the former in Dakota Territory and the latter in Minnesota. As a consequence there has been, is, and will be, a spirit of rivalry, but as far as we could judge not of rancor or ill-feeling. Of Fargo who has not heard, springing up, as it has, in a decade into a city of great commercial importance? In this letter we will briefly summarize the leading points of interest gleaned, giving our friends a more detailed description next week. The population at the time of the last census was 2,701; now it is estimated at from 4,000 to 5,000. There are six churches; two school-houses, with a new one in process of construction to cost $35,000; two daily, three weekly and one Sunday, newspapers, (one of which is Scandanavian) several civic societies; a Chamber of Commerce of 65 members, organized in 1879; a U. S. Land Office; two local fire insurance companies, and an immense traffic both wholesale and retail, as is

evinced by the following figures: The banking and exchange business forthe year ending, Oct. 1, 1881, is approximated at over $20,000,000; commercial transactions, exclusive of wheat, will exceed $11,000,000. The banking capital of Fargo is $315,000 (five banks). There were 1,350,000 bushels of wheat marketed in 1880. There are two large elevators, a large roller flouring-mill, and several smaller manufactories. The value of permanent improvements for the past year is estimated at $500,000. The growth of Fargo has been largely stimulated since the advent of the St. Paul, Minneapolis, and Manitoba Railway, offering a competitive line to the Northern Pacific. Several railway projects, some under way, we will discuss anon. Here we found the Holly water system with a capacity of 1,000,000 gallons per day; a street railway organized to be built this Fall; telephone connections with Moorhead, 97 working and 50 more ordered; and, in fact, all of the modern improvements. There are three large and well kept hotels, besides a dozen smaller ones. This ambitious young city, not content with a contracted radius of trade, is reaching out for country merchants' patronage and will become, no doubt, a commercial center for jobbing as well as retail trade.

Moorhead, too, has the aspirations and desires of her sister city and, although behind in the matter of population and volume of business, has the energy and will to become an earnest competitor. From this point two new railway lines are being built north and south, and with the trunk roads mentioned, this city bids fair to be a railway center of no mean importance. The necessity of a foot and a wagon bridge between the two cities is felt by both, and it will doubtless be built the coming Summer. Moorhead tallied 1,800 at the census: now estimated 2,700 to 3,000. It has six religious societies and five churches; the finest school building in Northwestern Minnesota; a weekly newspaper (a daily is soon to be established), and various civic societies. The public improvements of the past year foot up over $400,000, the greatest of which is the building of a magnificent hotel, the Grand Pacific, to cost when completed, with furniture, $165,000. It has 120 rooms, hot and cold water, gas, elevators and every modern appliance for comfort or luxury. That, with their present excellent house, will be apt to give Moorhead a reputation. In this handsome building the St. P. M and M. R. R., is to have ticket and general offices, waiting rooms, etc., all trains stopping here for meals. Other improvements to be inaugurated by this railway — round house, shops, etc.—will foot up largely. The handsome opera house is a feature. It cost $16,000 and is arranged neatly and tastily. That is something Fargo lacks and needs.

Moorhead has good water-works, the same telephone exchange, a street car company organized to operate with the Fargo company, and in many things the "dual cities" are aiding and abetting the interests which should be common to both. The banking capital of Moorhead is $160,000, with two banks; exchange and banking business between five and six millions. There is a large and increasing commerce—700,000 bushels of wheat were marketed there in 1880. The place has a storage capacity for grain of 150,000 bushels—to be more than doubled the present year. There is a fine roller flouring mill as well as a large brewery and other manufacturing interests. Property is yet reasonable and large purchases are constantly being made in both cities, as Eastern capital is seeing the advantage of Western investments. Around these cities the country is of the same general character as other portions of the famous valley heretofore described. A fuller and more detailed review of Moorhead's interests we will make the subject of a succeeding letter. The Red River of the North is navigable as far up as this, there being two lines plying between these points and Grand Forks.

East of Moorhead the St. P. M. & M. Railway intersects the Northern Pacific at Glyndon, a young village which commands its portion of trade in the section. Here we made a hearty breakfast. Speeding up the line which runs north to Manitoba, the first town of any importance at which we stopped was Ada. It is about midway between Glyndon and Crookstown, has a population of over 500, with elevators, numerous stores, hotels, lumber yards, etc. As a grain mark t it is rapidly improving, last year's shipments being over 350,000 bushels. It has at present an extended radius of trade, drawing for 20 miles around. There are church organizations, schools, societies, etc., and in many ways the town presents those characteristics which indicate a rapid growth and permanent prosperity. There is a bank as well as a well edited paper, the "Ada Alert," very aptly named, indicating, as it does, its wide-awake, broad-guage proclivities.

There are many ways in which the farmers of this district could still further improve their condition. They are taking too many eggs in one basket, or, in other words, putting too much reliance on wheat. We were astonished to learn that at Fargo and Moorhead, oats had been imported to a country where the yield is never less than 50 bushels and often as high as 75 to the acre. Then again, flax can be planted on new breaking, giving a considerable yield and improving and benefiting the soil, while it pays the farmer a profit on his first year. With free government lands, liberal rebates on purchases of the St. P. M. & M. railway lands, a short, prosperous season, and a comparatively certain yield, bringing a good price, it is no wonder that the most self-satisfied people we have met are the farmers of the Northwest.

Societies, &c.

THE ARKANSAS STATE FAIR.

[RURAL Special Report.]

THE NEW GROUNDS of the Arkansas State Mechanical and Agricultural Association are pleasantly situated about one mile from the city of Little Rock, Ark., and this is where the State Fair was held October 17-22, this year. The citizens have spent a considerable amount of money in fitting up the grounds, and as they are roomy and easy of access, there is no reason why, under proper management, this fair should not improve year after year. This year's fair was a great improvement over those of former years; yet, judged from a Northern point of view, the agricultural portion could not be called a success—too much horse, too much side shows, too much old-fogyism, and not enough of the life, energy and display that at the best fairs do so much in the way of educating both the dweller in the town and the dweller in the country. I never met with a warmer reception in my life than at this fair. A thing that very forcibly impressed me was the almost universal wish of the progressive men of this State for Northern immigration, Northern push and ideas. Within the past six years the State has made more progress in agriculture than during its entire previous history; but, strange to say, the railroads, especially the St. Louis, Iron Mountain and Southern, and a few progressive people are at the bottom of all this improvement. The State will not do anything for agriculture. The college, with its so-called experiment station, is situated so far away from any agricultural center that it is at present of no real use to the agricultural and horticultural portion of the community. The railroads centering here are doing the greater part of the work, assisted by the individual efforts of citizens and the State press.

The needs of this State can be easily ascertained on an examination of the fair, by what is *not* exhibited as well as by what is. Among the cattle on exhibition were a few good specimens of imported stock; but, though milk here is now worth 10 cents per quart and butter 40 cents per pound, still there has been no general effort to improve upon the native stock, and this in a country where all the finer grasses will grow the year round: clover, Timothy and Alfalfa grow luxuriantly, and Bermuda Grass spreads even into the city. What is wanted are good bulls of the Ayrshire, Holstein and Jersey breeds to cross on the native cows and thus improve the progeny for dairy purposes. In importing pure-breds from the North they should be brought when young, as they must get acclimated if expected to live. The native cattle here are small, weighing from 500 to 800 pounds, and they do not give over seven quarts of milk a day. I saw a number of pairs of steers that would not weigh over 600 pounds apiece. There is a great field for the dairyman and breeder in this State. In the agricultural department there were the same marks of negligence and unthrift. What was worth seeing was made up in great part by exhibits of such progressive men as Messrs. Kerr & Kannady, of Sebastian County, in the extreme western part of the State. For their county exhibit they brought seven car-loads of cattle, cotton, coal and agricultural produce, which made an excellent display of what the county produces. Their show of corn and wheat was especially good. Another fine exhibit was that made by G. W. Davis, of Jefferson County. He made a fine show of Eureka Cluster Corn, of which he raised the past season 76⅞ bushels of shelled grain per acre—a very large yield, considering the severity of the drought. This corn very much resembles Blount's White Prolific. It has about the same size of ear and kernel and grows from four to ten ears per stalk. It ripens with him in about 100 days.

The various soils of this State are fitted for almost every branch of agriculture. Cotton and corn thrive finely on the rich bottom lands; corn, wheat and garden products on the uplands. But with all these rich lands, large crops are not the rule. The farmers in this section want a higher education, and, so far as I can find out from talking with good representatives from all parts of the State, the farmers are more than willing—they are anxious—to learn and profit by the best methods practiced elsewhere in their vocation. Improved agricultural machinery is very little known in the State, and much of the cultivation is still left to the blacks, who rent the farms on shares and wear out the land with their loose manner of farming. For the first time in the history of the State, a State Agricultural Society has just been formed. Its officers are progressive farmers and planters, and they propose not only to develop the rich resources of the State energetically themselves, but also to call in Northern men, ideas and push, and raise the average crop of corn from 30 to 75 bushels per acre; of wheat from seven or eight to 30 bushels; and of rye, cotton, oats, etc., in proportion. The land here is capable of producing as large crops as are harvested in any part of the great Southwest; all that is needed is proper tillage to bring them forth. The Society proposes to establish county and town societies all over the State.

The exhibit made by the Little Rock and Fort Smith Railway, which runs through the center of the State from Little Rock to the western boundary, showed the great variety of products which that section of the country is capable of raising. Dr. W. W. Hippolite, Vice-President of the National Bee-Keepers' Association, made a handsome exhibit of honey and bees. He uses a modification of the Langstroth hive, made to suit this climate. There was quite a fair display of butter and cheese in small quantities, the first premium on which was carried off by an old New-Yorker—Walter Crandall, of Prairie County.

The show of agricultural machinery, wagons, etc., was light. It would be well for our manufacturers to make better exhibits here another season, for I never found a population more sadly in need of improved machinery. Cotton machinery—presses, gins, planters, etc.—were on exhibition, but no grain drills, saw mills or mowers and reapers, and many other machines that are needed in this section, were not shown. Numbers of farmers and planters, if only they were made acquainted with the advantages of these machines, would buy them, and, by greatly increasing their crops by their use, open up an extensive market for them. Sheep and swine were about the same in merit as the cattle, and could be greatly improved by more care and better breeding. There was a world too much horse—not "agricultural hoss trots," but regular horse races, with all the accompanying pool-selling. This sort of thing should be replaced by breeders' purses, and the pool-sellers should be driven from the grounds, as well as the side shows, which have no proper place at an agricultural fair. Several gambling games were started on the grounds—absolute swindles—but to the credit of the officers of the Society it must be said that as soon as they found out the character of these, the swindlers were hustled off the grounds and their tools confiscated.

It is claimed that to draw a crowd it is necessary to have horse racing, military shows, etc. Let this Society next year use the same amount of money paid this year to the horse owners and military companies and offer extra premiums for breeders of cattle, sheep, swine and mules, as well as for county exhibits of agricultural produce, and see if the reform will not bring not only a much finer lot of exhibits, but also as large a crowd. The citizens of Arkansas have altogether too much pride in their State to allow their fair to become a failure, and a large and fine show of stock and machinery will bring numerous visitors from other States, as well as throngs of natives. The progressive citizens of this State are fully alive to the fact that if they want people to come here they must show them not only what lands they have, but what these lands can and have produced. In a short time an agricultural paper will be started under the auspices of the new State Agricultural and Horticultural Societies, following, as far as its means will permit, the style of the RURAL NEW-YORKER — devoting more attention to the treatment of facts than of theories, and if the farmers and planters throughout the State give it the support already promised, its success will be assured. W. H. K.

CATALOGUES, ETC.

FOURTEENTH ANNUAL REPORT of the Ohio State Horticultural Society for the year 1880-1. Dr. J. A. Warder, Cincinnati, President; G. W. Campbell, Delaware, Ohio, Secretary: We shall take occasion to refer to this very valuable report again.

TENTH REPORT on the Noxious and Beneficial Insects of Illinois; by Cyrus Thomas, Ph.D., State Entomologist. This is one of a series of reports, the first one of which was made by Mr. Marsh, the next four by Dr. LeBaron, and the remaining five by Professor Thomas. The value of these reports is well attested by the large demand for them, not only in Illinois, but in other States as well. A large portion of the present report is devoted to the descriptions of larvæ, as it is in the larval or worm stage of existence that farmers and horticulturists meet with many insects. But two orders have been here discussed, the Lepidoptera and Hymenoptera, as it is the author's aim to treat thoroughly, each year, of one or more of the notedly injurious insects. The Army worm is discussed in its various life stages. There is a descriptive catalogue of larvæ; the question of the relations of climatic conditions to the development of injurious insects forms an interesting chapter; a new corn insect is discussed, and a long list of plants injured by the various insects mentioned in the report and of the scientific names of the species which injure them, is affixed. There are numerous illustrations throughout the work—about 200 in all. Dr. Packard's paper on the Hessian Fly is inserted by his permission. Professor Thomas is doing a grand work for the State of Illinois and the country in general, in his investigations into the nature, habits, etc., of various noxious and beneficial insects, and we wish him "long days" in which to carry on a work so much demanded.

Entomological.

A NEW INSECT ON PEACH TREES.

A. J. CAYWOOD.

QUITE A SCARE is taking hold of peach-growers here, and they have good reason for the fright owing to the danger threatening their business. About four years ago I was informed that certain growers were losing peach trees in from one to two years after the cause made its appearance. On visiting the places, I found gum issuing in small jets all over the trunk, from the surface of the ground to well up among the branches, and so numerous were the jets that it was difficult to put the end of one's finger between them. I found minute insects moving about on the surface of the bark, so small that they had previously been overlooked. On placing a microscope over them I discovered a perfect beetle with covered wings, almost precisely the shape of the large May Beetle, but not more than one-sixteenth of an inch in length, and when the wings were extended they were three times the length of the body. For the want of a proper name I call it the "gum bug." It is brown, approaching black.

During the past two years I have endeavored to ascertain its changes from the egg to the perfect beetle, with less success than with any other insect to which my attention has been called. I thought the egg was deposited in the bark in the Fall, and that the larva, after hatching and living there one season, made its appearance as a perfect insect annually; but I find the beetles, both under the bark and on the surface, eating their way in and placing themselves in a position like that of those I find under, and whether the egg is deposited in the ground and the insect there perfected, afterwards attacking the tree for food, or whether the transformation occurs in the bark, I have not determined. It is possible that the egg is laid in the bark; that the perfected insect comes to the surface annually, and afterwards eats back a hole in which to deposit its egg; but having no knowledge of any insect that deposits its egg in this way. I cannot convince myself of its certainty.

The pests do not appear on young trees to half the extent that they are seen on larger ones. They are first discovered near the ground and the second and third year they proceed up the trunk. This fact led me to believe that the egg is deposited in the tree. This Fall I took out and utterly burned some 25 five-year-old trees that one year ago were pictures of health. By running the hand up the body a handful of gum could be obtained with one effort, each insect killing a spot of bark half an inch in diameter down to the wood; but the cavity in which it lies is but an eighth of an inch across. Passing through the grounds of a neighbor a few days since I did not discover a single peach tree that was not a perfect blotch of gum, and all of them will be removed next Spring.

The beetle makes its appearance about the first of September and continues its warfare down to December. As above stated, it is new here, but may have been known longer in other sections. Some think it has been introduced in trees from other localities. If it does exist elsewhere, and a remedy is known, we hope it will be speedily given, or the peach business is doomed; for when the pests make their appearance they surely spread from tree to tree until all are infested. They began with me in a single tree.

No gum issues while the insect is in the hole—I suppose they consume it; but it follows

when they leave. Heretofore I have been opposed to all kinds of daubs or tight covering on the bark of trees, but I have been compelled in this case to try some experiments. I made a wash of two parts of lime and one of wood ashes, in a pailful of which I put two tablespoonfuls of crude carbolic acid and two of Paris-green, and with the mixture I made a covering over the trunks with a brush, but the bugs come out and a few enter through it, but I intend to wrap the bodies of trees with roofing paper tarred on the outside, which also repels the peach borer.

Marlboro, N. Y.

Pomological

THE OTT PEAR.

I would like to ask Mr. Parnell, see RURAL Oct. 22, p. 715, col. 4, what time his Ott Pears ripened. Mine began to ripen about the middle of September and continued on till the middle of October, and then, as the fruit was falling from the tree rapidly, I picked all, and have been using them since, chiefly for baking, as it is very sugary and by this cooking it becomes juicy and tender even in its skin, which before baking is rather thick, hard and dry. This pear is as delicious baked as the Jersey Sweet or the celebrated Belle Bonne apple. It is precisely as Mr. Downing describes it in the Fruits and Fruit Trees of America, edition of 1857, p. 441, except in the ripening, which he says is the middle of August. [For the benefit of those who have not Downing's excellent work, here is his description of the Ott Pear:—A seedling of the Seckel. Originated with Samuel Ott, Montgomery Co., Pa. Tree moderately vigorous, very productive. Young wood reddish olive-brown. Fruit small, round-obovate, greenish-yellow, partially mottled with russet, reddish on the sunny side. Stalk long and curved inserted in a slight depression. Calyx open in a round, open basin. Flesh melting, sugary, rich, perfumed and aromatic. Ripe middle of August. An excellent little pear, somewhat variable. Good to very good," —EDS.] Perhaps, however, my pear may not be the genuine Ott, but some other sort. There was no difference in the quality of those borne on different trees, as was the case with Mr. Parnell's, but all were alike sugary. I think these will keep in store as late as the middle of November. I am going to try a few to see if they do so, sound and sugary. A. B. ALLEN.

The Vineyard.

THE MARY GRAPE.

This grape was received from Mr. Peter Sandovel, of Sandy Creek, N. Y., a year ago last Spring and fruited this season. The grape proves to be the Massasoit, one of Rogers's hybrids. I have them both under the same conditions within a rod of each other. They have been examined by several skilled horticulturists, and no man can see any difference. I think Mr. Sandovel claims it to be a Labrusca grape, but it has all the characteristics of Rogers's hybrids—fine quality, emasculated clusters and all the other features of these hybrids. Here is a fine opportunity for Mr. Sandovel to rise and explain why he is sending out to the public the Massasoit with a new name. D. S. MARVIN.

Watertown, N. Y.

[A vine labeled "Mary" was sent to the Rural Grounds several years ago. We cannot at this time find the record. It has made a feeble growth and never fruited.—EDS.]

Domestic Economy

CONDUCTED BY EMILY MAPLE.

ECHOES FROM EVERY-DAY HOUSE.

ANNIE L. JACK.

THE days are cold and dark and dreary; truly the dullest Autumn I ever remember, without a ray of sunlight for days together, with leaden skies and falling leaves. The children feel the influences of the weather and lose their bright serenity. The roses in the greenhouse are slow to blossom and need the rays of sunshine to hasten development. Everything feels the absence of warmth and light. But we go on with our domestic affairs; the Fall house-cleaning must be done; pickles be furnished and packed away, the garden needs to be looked after and such bulbs as gladioli and others, carefully secured. The poultry, too, seem as if they felt a lack of something to help them fulfill their destiny, and eggs are not plentiful. We know there will be a change for the better when the buckwheat is thrashed; for at this season of the year nothing is better than that grain alternately with corn for laying hens. So, the other day, we made some cookies that were independent of eggs, and which were pronounced very good by all the family. It was from this simple recipe: Two cups sugar, one cup sweet milk, one of butter, half a teaspoonful of soda with flour enough to roll. We flavored some with vanilla, others with lemon and their only fault was that we too soon found the bottom of the cake box. Children seem to have a natural fondness for cake, and such as this simply made is better for them than a more expensive article. For this reason we often make our own candy, as the little one's enjoy the making and we know it is more wholesome than that which is highly colored and often unhealthy. What a care and thought are little children during the dull Autumn weather! No more freedom to ramble at will through the fields for wild flowers and fruit. No more Summer birds, and waving trees. "Why do the leaves come off?" asks little four-year-old, and there is in his tone a regret that finds an echo in older hearts.

THE ROMANCE OF HOUSEKEEPING.—FIG. 517.

KEROSENE STOVES.

MARY Wager-Fisher, page 723, asks for the experiences of those having used kerosene stoves.

Our family has had one in use since May 1. The total amount of oil used, including that burned in our lamps, has been 37 gallons, costing $3.70. The cost of oil for the stove has been therefore less than two cents per day—cheap enough certainly. The cooking has all been done on this stove about six days in the week, the cook-stove only being used for washing, heavy baking, etc. We consider the kerosene stove one of the greatest conveniences that has been invented for years, one that nearly every family in this section that has enterprise enough to take the papers and read them has availed themselves of. A meal can be cooked on them in about the same time it requires to get a coal fire ready for cooking, and then if a little hot water is wanted at any time, as in sickness, it can be had in a few minutes. Another important consideration is, it does not heat the room, an advantage that any woman will appreciate during the Summer months. These stoves are now kept by all hardware dealers in endless variety, so that there is no difficulty in procuring what one wishes. And now a word of advice; in purchasing be sure to buy one of the greatest heating capacity to be found, one with four burners is the best. The largest can be run as lightly as you wish, while a small one will not do all you desire.

I think that our oil stove has saved us, in fuel, the cost of it already besides its great convenience.

May I be allowed to add that I am in no way interested in the sale of these stoves, and that it will be needless for your readers to send me postal cards asking terms, etc.

Onondaga Co., N. Y. NELSON RITTER.

CONSIDERATION FOR THE SICK.

PERSONS who have had and seen but little sickness cannot appreciate the suffering of a sick person from noise. During an attack of malarial fever, a few years ago, it seemed to the writer as if the members of the family tried to slam the doors, and we thought that if we recovered we should surely teach both old and young of the household to go about their duties with less noise and particularly to open and close doors carefully. The olfactory sense is also keener during illness and we well remember the nauseous sensation caused by tobacco smoke. One member of the family who was absent during the day and whom we dearly loved to have sit with us in the evening, joined us only after supper and after he had smoked his pipe. He was sensitive and we did not care to mention our *then* great repugnance for tobacco, but no doubt it would have been far better to have "spoken out" than to have suffered night after night from the fumes of that dreadful pipe.

Persons in health are too apt to think such persons notional and treat them accordingly. Nervous and notional they are, it is true, but they are entitled to all the consideration in the world and those who care for them should be willing to make every reasonable sacrifice to gratify their desires, however whimsical they appear.

DOMESTIC RECIPES.

MASHED TURNIP.

Pare and boil, adding a few potatoes in time to boil tender with the turnips. Drain, mash, and, if not entirely free from lumps, pass through a colander. Season with pepper and salt and a generous lump of butter.

POTATO SOUP.

Peel and slice 12 medium-sized potatoes, cover with boiling water, cook 10 minutes, drain off the water, add a quart of cold water, an onion minced and a little salt, and cook until the potatoes boil into pieces. Pass all through a colander into two quarts of good soup-stock free from grease. *Simmer* half an hour. Boil half a cup of rice until tender and dry. Put into the soup, season with pepper, salt and two tablespoonfuls of butter, and serve.

BARLEY SOUP.

Two or three pounds of beef from the skin, two pounds of cracked bones, an onion, four stalks of celery, four potatoes, a gallon of water, pepper and salt. Put all into the soup-pot and boil very gently three hours. Wash a cup of barley and boil in a very little clear water 20 minutes. Strain the soup, pressing hard, boil up, skim, add the barley and simmer 30 minutes.

PLAIN TAPIOCA PUDDING.

Soak a cup of tapioca over-night in a little cold water, an hour before wanting add a quart of boiling milk, a coffee-cup of sugar, four beaten eggs, half the rind of a lemon, grated. Stir thoroughly, pour into a buttered mold, cover tightly and set into a pan of boiling water in the oven. Cook from 45 to 60 minutes. Turn out and eat with hard sauce.

Miscellaneous.

FREE TO YOU!

A Beautiful Pearl Shell Necklace and Locket!

Among the beautiful new goods imported from Europe this fall, the **elegant Pearl Shell Necklace and Locket** which is represented by the accompanying illustration, has attracted marked attention. Our engraving is reduced in size, shows only a section of the chain, does not do the goods justice, and, in fact, only a faint idea of the remarkable beauty of this charming Necklace and Locket can be obtained from it. The Necklace is composed of a number of beautiful Pearl Shells jointed with silvered ornaments; the Locket is of enameled pearl set in silver plate. This is not a child's Necklace, neither has it any appearance of cheapness; it is a new and beautiful design, will never tarnish or wear out, and will be admired by all who see it. We now propose to make an **Absolute Free Gift** of one of these elegant Pearl Shell Necklaces and Lockets to every one who desires to possess it. We propose, in order to extend the circulation of our large and beautiful magazine, THE FIRESIDE AT HOME, and introduce it into thousands of new homes, to give a NECKLACE AND LOCKET FREE to every THREE MONTHS' TRIAL SUBSCRIBER. *Read our great offer: Upon receipt of* **Only 25 Cents** *in postage stamps, we will send* **The Fireside at Home for Three Months,** *and to every subscriber we will send one of these Elegant Pearl Shell Necklaces and Lockets Free.* THE FIRESIDE AT HOME is a large and handsome magazine of 32 large 3-column pages, with a handsome cover, elegantly printed and profusely illustrated. It is the largest and finest dollar magazine in the world. Each number contains a complete novel by a celebrated author, many interesting short stories, sketches and poems; many illustrated descriptive articles, very instructive; portraits and biographies of distinguished people; Ladies' Fancy Work, Sermons by leading Divines, Household Recipes, Farm and Garden Notes, Stories, Puzzles and Games for the Young, Wit and Humor, etc. By taking advantage of this great offer you can secure this large and charming magazine for three months (including all the brilliant holiday numbers soon to be issued) and our beautiful Pearl Shell Necklace and Locket—all for only 25 cents! Every lady should send for this great bargain for herself; every gentleman should send and get the magazine for himself and make the premium a present to a lady friend. The two will be sent to different addresses if desired. *Perfect satisfaction guaranteed or money refunded.* As to our reliability, we refer to any publisher in New York, also to the commercial agencies. Send at once, and get the greatest bargain of the age. Address,

F. M. LUPTON, Publisher, 27 Park Place, N. Y.

Stock.

Cheshires a Specialty.

At State Fair, 1880, my stock won *all* the FIRST PREMIUMS in class Large White, and all the seconds but one. I have on hand a lot of

SPLENDID YOUNG PIGS,

from my very best sows. Pigs dress from 300 to 400 at 9 months. In the past four years I have shipped 70 times to men I had shipped to before.

Simple, durable, of the best workmanship and material. Solid Wrought Iron Boilers. Engine complete on board cars at Springfield, O., at following prices: 3-horse power, $275; 5-horse power, $300; 7-horse power, $375; 10-horse power, $500. These engines fully guaranteed in every respect. Address Common Sense Engine Co. Springfield, Ohio.

News of the Week.

HOME NEWS.

MONDAY, Nov. 7, 1881.

The World's Fair project is having a singular see-saw between New York and Boston. The former city undertook it, and then gave it up. Boston thereupon examined it, and very nearly gave it up. But before this conclusion had been reached, the prospect that Boston would try it seemed to revive it in New York; and when Boston had about despaired of it the news that New York was after it again started the Boston movement afresh. This may not actually have been the way events went on, but there are appearances suggesting that such influences were at work. At all events people in both cities have the project now under consideration, being apparently reluctant either to give it up or carry it forward. The Boston executive committee of thirteen on the World's Fair met Nov. 1, and agreed upon the form of a circular to be addressed to three of the leading representatives in each class of business trade and in each profession. The circular calls upon the gentlemen to organize immediately in the interest of an exhanstive personal canvass among their business and other acquaintances so that the ground may be covered.

Thirty subscriptions of $1,000 each have been made at Cleveland, O., towards the erection of the Garfield monument. Nearly $14,000 in cash has been received by the committee.

Mrs. Garfield, at Painesville, Lake County, O., on the 2d inst, took out letters of administration on the late President's estate. Her bondsmen are W. S. Streator, Internal Revenue Collector, and N. B. Sherwin, Cleveland's Postmaster, both of whom have been General Garfield's life-long friends. The main bulk of the property to be cared for is the house at Washington and the farm at Mentor. There is very little personal property, and the life insurance of $50,000 is equally divided between the wife and family.

On Tuesday, November 8, elections will be held in Virginia, Pennsylvania, Massachusetts, Colorado, Mississippi, Nebraska, Wisconsin, Maryland, New Jersey, New York and Minnesota. Five of these elections will be held for the purpose of choosing a full board of State officers, and Legislatures will be chosen in four Commonwealths. New York will elect four Congressmen; various other officers will be chosen in different States, and constitutional amendments will be voted upon in Nebraska, Wisconsin and Minnesota.

The reductions in the star route service during October aggregated $55,778, making a total since Postmaster-General James began his reductions of about $1,575,000 per annum.

The average yearly income of the public school teachers in Maryland is $260.

Secretary Folger is expected to take charge of the Treasury Department about the 12th inst.

Senator Johnston says that the deficiency in the Yorktown fund will amount to $10,000.

New York is relieved of its apprehensions on the score of water. Copious rains have deluged the Croton supply region, and the stint gates have been raised at the storage reservoir in Central Park. Citizens are now using and wasting water with the usual freedom, and if frost does not lock up the streams too early there need be no fear of water shortage the coming Winter.

Governor Long, of Massachusetts, is first to give the turkey warning that his day of doom approaches. He fixes the 24th inst for Thanksgiving in that State.

The estimates of the Postmaster General encourage the hope that the department will become self-sustaining at no distant day. Estimating expenses at what past appropriations and deficiency bills prove they will be, Mr. James thinks $920,000 will measure the excess of expenses over receipts during the fiscal year ending with June 1883. And if business maintains the present rate of increase even that amount will not be wanted. The post-office department was never before so near self-support.

Lieutenant Governor Weston, of Massachusetts, has given $1,000 for the Garfield professorship at Williams college.

Colonel Dudley, Commissioner of Pensions, has submitted to the Secretary of the Interior a recommendation that Congress be asked to appropriate $100,000,000 for disbursement of his office during the next fiscal year (ending June 30, 1883) in payment of annual and accrued pensions, and also that an immediate deficiency appropriation of $20,000,000 be requested for the purpose of paying all arrearages of pensions to claimants whose cases have been or may be favorably adjudicated during the present fiscal year.

Arrangements are being made by the Postmaster General whereby the mail from this city to Chicago shall reach its destination about a day sooner than it now does. The mail will leave here at 4.35 A. M., arriving at Buffalo at 7.40 P. M. and at Chicago at 9.05 A. M. of the following day. The regular mail train now leaves here at 8 A. M. and reaches Chicago at 7.40 P. M. the second day.

A Newark N. J. Bank has been robbed of $2,000,000 by its former cashier. He has turned States evidence and has involved several others in the crime.

Wendell Phillips has been invited by the Treasurer of the Irish Land League to go to Ireland and advocate "No Rent," but the "silver-tongued orator" declines. He cables a despatch full of sympathy but says his health will not permit him to continue in public speaking to any great extent.

Snow fell in many localities on the 4th. In portions of Chautauqua county it reached a foot in depth. At Mauch Chunk, Pa., the mercury went down to 12 degrees above zero.

Governor Cornell has designated Thursday, November 24, as a day of national thanksgiving and prayer.

The Hon. Hannibal Hamlin, the new Minister from the United States to Spain, with his wife, sailed for Europe in the steamship Illinois from Philadelphia on the 5th. Miss Blaine, daughter of Secretary Blaine, and ex-Senator John Scott and wife of Philadelphia also sailed in the same vessel.

The resignation of the Hon. John W. Foster, Minister to Russia, has been accepted by Secretary Blaine, in the name of the President. The President has not yet decided upon Mr. Foster's successor. For the present the affairs of the Legation will be under the charge of Col. Wickham Hoffman, as Charge d'Affaires ad interim.

Postmaster-General James will retain his place in the Cabinet till the 1st of January, when he will take the direction of a new bank in New York city.

Hoboken, N. J., had a $300,000 fire yesterday. Had the fire companies responded the flames might have been checked before much damage was done, but being volunteers, working without pay, and having been ill-treated by the City Council, two only out of seven companies responded and one of these was made up of one alderman and 25 small boys. The citizens, generally, did not blame the firemen for their non-action. Hoboken may now see the advisability of having thoroughly equipped, well-paid fire companies!

"Wonderful, Wonderful Medicine!"

So exclaims a patient, Rev. J. S. Fesperman, of Statesville, North Carolina. Writing June 2d, 1880, he says: "In the Providence of God I owe my present state of health to your Oxygen. I was near the gate of the grave, and as I believe close to the great portals of eternal life, when I commenced taking what I now consider the greatest of all healing agents, Compound Oxygen. I can not refrain from saying, 'Wonderful, wonderful wonderful medicine!" Physicans and friends had believed that I could not live any length of time, and I am here yet, with my large family of children, and able to walk from three to four miles every morning. I can not speak in terms too high of your remedy." Our Treatise on Compound Oxygen, containing large reports of cases, and full information, *sent free*. Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.—*Adv.*

AGRICULTURAL NEWS.

MONDAY, Nov. 7, 1881.

Illinois Embargoes Eastern Cattle.

The following proclamation has been issued by Gov. Cullom of Illinois: "State of Illinois, Executive Department, Springfield, Ill., Nov. 1, 1881. In pursuance of the act of the General Assembly of the State of Illinois, entitled "An act to suppress and prevent the spread of pleuro-pneumonia among cattle," approved May 31, I, Shelby M. Cullom, Governor of the State of Illinois, do hereby proclaim that I have good reason to believe that pleuro-pneumonia among cattle has become epidemic in certain localities in the States of Connecticut, New York, Pennsylvania, New Jersey, Delaware, and Maryland—viz.: in the County of Fairfield, in the State of Connecticut; in the Counties of Putnam; Westchester, Kings, and Queens,, in the State of New York; in the Counties of Lehigh, Bucks, Berks, Montgomery, Philadelphia, Delaware, Chester, Lancaster, York, Adams, and Cumberland, in the State of Pennsylvania; in the Counties of Bergen, Hudson, Morris, Essex, Union, Somerset, Hunterdon, Middlesex, Mercer, Monmouth, Ocean, Burlington, Camden, Glouster, and Atlantic, in the State of New Jersey; in the County of Newcastle, in the State of Delaware; and in Cecil, Hartford, Baltimore, Howard, and Carroll Counties of Maryland; and I hereby, as required by said act, prohibit the importation of any domestic animals of the bovine species into this State from the aforesaid counties in the States of Connecticut, New York, Pennsylvania, New Jersey, Delaware, and Maryland after the 10th day of November inst., unless accompanied by a certificate of health properly signed by a duly authorized verterinary inspector. Any corporation or individual who shall transport, receive, or convey such prohibited stock shall be deemed guilty of a misdemeanor, and upon conviction thereof shall be fined not less than $1,000 nor more than $10,000 for each and every offense, and shall be liable for any and all damage or loss that may be sustained by any party or parties by reason of the importation or transportation of such prohibited stock. (Sec. 4 of act approved May 31, 1881.) In testimony whereof I hereto set my hand and cause the great seal of State to be affixed. Done at the City of Springfield, the day and year above written. By the Governor: S. M. Cullom, Henry Dement, Secretary of State." The above proclamation has been received just as we are going to press.

THE following items of agricultural news are condensed from telegrams from the various points received here from Friday evening, November 4, to this Monday afternoon, November 7: Portland, Me.—General business falling off, and will do so until end of year. The season, however, has been prosperous and profitable, especially in all kinds of agricultural produce..... Boston, Mass.—Demand for wool good, full prices sustained. Sales for the week 2,450,000 lbs including Ohio and Pennsylvania at 43@44c for x and 44@45c for xx and above. Michigan in demand at 42@42½c, though some heavy lots have been sold as low as 41c. Considerable doing for the Philadelphia market in No. 1 fleeces at 45@47c for Michigan and Ohio. Unwashed fleeces ranged for 15@24c for low and coarse; 27@28c for fine, and 28@35c for medium. California wool hard to sell. Beef dull. Pork and lard quiet; flour dull and prices less firm.....Buffalo, N. Y.—Receipts of grain, instead of increasing as usual at this season, are falling off. Owing to a disposition to hold back grain at the West many vessels have had to seek more remunerative business than competing for the small grain freightage. The grain receipts for October were only 6,237,751 bushels, a falling off of 10,000,000 from same time last year—the smallest receipts in ten years. Shipments of grain by canal this year foot up 28,302,872 bushels against 63,278,404 in 1880. Shipments of grain from elevators by railroad from January 1 to November 1 were 19,788,860 bushels, against 24,309,738 bushels in 1880. The small business tracable to railroad wars and consequent close competition, and wild speculation which has prevented grain from coming forward.... Philadelphia, Pa.: The wool market is quiet; holders are firm, however. Cotton quiet, with a shade of improvemnnt. Flour prices are a little off, while wheat prices are slightly stronger. Produce fairly active at good prices. A fair jobbing trade in provisions.....Dayton, Ohio: Favorable reports still come in from the tobacco country. Desirable tobacco remains strong, prices of lower grades have advanced slightly, which is significant.....Cincinnati, Ohio: Reports from tobacco regions say the second crop is maturing nicely. The pork packing season has opened but business is so far light. Corn wheat and flour dull.....Toledo, Ohio: grain market strong; prices firm, with an upward tendency. No 2. red Wabash wheat, $1.33 spot; $1.35½ Dec.; $1.37⅞ Jan., $1.40 Feb. Corn No. 2. spot, 61c. Oats No. 2. 44c.....Louisville, Ky.: Pork packing has not begun, weather being too warm and farmers' prices being thought too high. Tobacco quiet and stationary. The new crop of barley brings 3@5c. more than at this time last year. Provisions firm. Wheat receipts light with a declining tendency in prices.... Detroit, Mich: grain trade light. Wheat crop in Western Mich. is nearly all bought up. Elsewhere half to three-fourths is kept back: but it is largely sold for future delivery. Trade in corn, oats and flour vastly greater than at corresponding time in previous years, while in wheat it is three-fourths less. October was the greatest speculative month in the year—sales 11,000,000 bushels. Scarcity of cars restrict grain and all other trades. Weather and roads bad..... .....

CHICAGO, ILL.—Hogs coming in freely, averaging about five pounds lighter than last year. Packing houses getting under way, but prices of hogs are weak. Receipts of grain comparatively light with a bearish tendency in prices.....St. Louis, Mo.—Pork has dropped. Tobacco weaker. Wheat receipts increasing largely. Weather still inducing corn molding.....Milwaukee, Wis.—Weather still unfavorable, grievously affecting receipts and shipments. The wheat market has taken an upward turn under influence of wet weather, a keen speculative demand and steadier cablegrams, the net advance being 1@1⅛c per bushel. Receipts and shipments of cereals are light. Bad roads are blocking movement of produce.

Cited by the Washington (Ind.) Gazette is the fact that the colts in that locality have a sort of lameness in the joint. J. F. Meyers cured his by anointing it with St. Jacobs Oil.

Rumford Chemical Works.

This is one of the prominent manufacturing concerns of Providence, R. I., whose reputation is world wide. It was organized with a limited capital, but by energetic, persevering industry in the manufacture of their standard preparations, they have grown to a magnitude which is little short of the marvellous. They manufacture in enormous quantities, Prof. Horsford's Phosphatic Baking Powder, made from his Acid Phosphate. This Powder is packed in tin cans of the usual sizes, and is made according to the directions of Prof. Horsford, the well known authority on bread. The names of the inventor and manufacturer of the Powder are a guarantee of its superiority and healthfulness.

Doctors may Disagree

as to the best methods and remedies, for the cure of constipation and disordered liver and kidneys. But those that have used Kidney-Wort, agree that it is by far the best medicine known. Its action is prompt, thorough and lasting. Get a box or bottle and try it.—Eagle.

ATTENTION ARKANSANS!—B. G. Sweet, Walnut, Crawford Co., Kansas, says: "Will some subscribers to the RURAL NEW-YORKER, living in Arkansas, who would be willing to answer questions in relation to their section of the State, as to price of land, climate, etc., kindly send me their addresses by postal card."

We are strongly disposed to regard that person as the best physician who does most to alleviate human suffering. Judged from this standard, Mrs. Lydia E. Pinkham, 233 Western Ave., Lynn, Mass., is entitled to the front rank, for her Vegetable Compound is daily working wonderful cures in female diseases. Send for circular to the above address.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is enough. Price 25 and 60 cents per box.

Dandruff

Is Removed by the Use of Cocoaine.

And it stimulates and promotes the growth of the hair.

BURNETT'S FLAVORING EXTRACTS are the best.

The Markets.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Nov. 5, 1881.

BEANS AND PEAS.—Several weeks of slack trade have caused some depression and holders have been forced to meet buyers. Exporters are not operating and the home trade make quite a handle of the reports of foreign beans to come. The season, however, is young and holders of prime do not express any alarm at the weak condition of the market. Green peas plenty at $1.75@1.80 for Wisconsin: Southern B. E. peas doing better: quoted $3.10 per 2 bu. bag.

Marrow beans, prime, $3.40; fair to good, $3.15@3.25; medium, choice, $3.25@3.30, fair to good, $3.00@3.15; pea, choice, $3.25@3.40; white kidney, $3.40@3.45; red kidney, $3.00; old, $2.00@2.85; turtle soup, $1.80@1.90.

Receipts of beans for the week, 10,016 bush.

Exports do. 101 bbls.

BUTTER.—The market is without new features. Trade is much below the usual expectation for Nov. Fine creamery and dairy are quoted as before, but in the opinion of the trade the next turn will be in buyers' favor. Early bought dairies are making money at present rates. Western and under grades of State dull and weak.

Creamery, State and Elgin, choice, 36c.; good to prime, 33@34c.; sweet cream, fresh, 32@33c.; fair to good, 24@30c.; State, June, good to prime, 25@28c.; Western, choice, 31c.; good to prime, 30@32c.; fair to good, 28@30c.; poor, 18@23c.; June, prime, 26@27c.; fair to good, 22@25c.; State firkins, dairies, choice, 28c.; good to prime, 25@27c.; fair, 22@24c.; poor, 18@20c.; dairies, half tubs, choice, fresh, 32@33c.; good to prime, 28@31c.; fair to good, 25@28c.; Welsh tubs, choice, fresh, 31@32c.; good to prime, 27@29c.; fair to good, 24@27c.; poor to fair, 18@23c.; Western imitation creamery, 29@31c.; Western dairy, fresh, choice, 26@27c.; good to prime, 23@25c.; fair to good, 20@23c.; poor to fair, 17@20c; factory and ladle-packed, Iowa, fine June, 17½c.; Ohio and Indiana, June, good, 17c.; late made, good, 16@16½c.; fair, 15@15½c.; poor, 14@14½c.

Receipts for the week, 28,490 pkgs.

Exports do. 2,825 do.

COTTON.—There is no pointed animation and some one expresses it "it is anybody's market at the moment." The outlook is a little firmer as there are reports of frost damage at some points of the cotton belt.

CURRENT PRICES FOR SPOT COTTON.

Quotations based on American standard of classification and on cotton in store, running in quality not more than half a grade above or below the grade quoted.

CHEESE.—The market still has only a moderate attendance and prices do not exceed our last rates. The chief run is upon fine Sept. The home trade is also using late markets and the competition is about all that supports 13c. All low grades of cheese are dull and accumulating.

State fact'y, fine, Sept, 12¾@13c.; good to prime, 11½@

The Fair Number of the **Rural New-Yorker** *(44 pages), which contains a full description of our* **Free Seed Distribution for 1882,** *also an account of the* **$2.000 worth of Presents** *offered to those subscribers who produce the best yields, and our Premium Lists for all who interest themselves in securing subscribers for the Rural New-Yorker, will be sent free to all applicants. Our new Posters are also ready and will be sent free to all. Our friends and agents are reminded that the present is, on many accounts, a more favorable season for securing subscriptions, or the promise of them, than later, when competition is keener.*

The Rural New-Yorker is for the North, South, East and West.

It knows no sectional prejudices. Everybody who is interested in a garden, vineyard, orchard or farm; in new plants, in farm or garden implements; everybody who is interested in Horticulture, and seeking through such means to increase the happiness of life and home, should subscribe. The Rural New-Yorker is the earnest friend of all who love nature and her works.

The first journal to have established an Experimental Farm conducted in the interests of its readers.

The Rural New-Yorker is acknowledged, by those who should know, to have worked a new era in rural journalism. Five Hundred Illustrations from nature annually; the best writers; the best draughtsmen. Ask those who know.

Horses, Cattle, Sheep, Swine, Poultry,

Milk, Butter, Cheese, Diseases of Animals, Bees, Injurious Insects, Grain, Grass, Small Fruits, all Ornamental and Useful Trees and Shrubs are among the prominent subjects treated in its columns.

No matter where you live, you cannot afford to be without the Rural New-Yorker. It is the progressive, aggressive, alert, original, conscientious rural journal of the age. Thousands of testimonials to this effect. Our **Everywhere Reports** are invaluable to the Farmer and Horticulturist. They have proven of great value to them in determining the best time to **Buy** or **Sell.** Our market reports are corrected by a special reporter up to the time of going to press. Our agricultural and general news embraces everything of interest to intelligent readers. Correspondents everywhere. Thirty-second year of its age: Fifth year under its present management. Try it—*Try it*—TRY IT—for one year. It will cost you but $2.00. It may save you hundreds. Try it as a measure of Economy.

The objects of the Experiment Farm of the Rural New-Yorker are to test all kinds of new seeds and to present the results to our readers; to produce new varieties of grain by cross-breeding; to test new farm implements and methods of culture, with a view to producing the greatest yields at the smallest cost; to disseminate seeds of varieties which, from our own tests, have proven of unusual worth among our readers, without cost to them, and thus advance the agricultural interests of the whole country.

The Rural New-Yorker has no personal interests to subserve. It has neither seeds nor plants nor books nor anything whatever to sell. It is conducted purely in the interests of Agriculture and Horticulture and Stock-Keeping. Its tests of plants, seeds, manures, implements, are made regardless of individual interests or those of advertising patrons. It holds the interests of LAND CULTURE as above all others, and its aim is to benefit all who occupy themselves in the culture of land and its attendant industries, either for pleasure, profit or support.

The Rural New-Yorker earnestly labors to instruct the stockman and breeder; to introduce new fruits of improved quality; to make known the beneficent influences of the garden and of trees and shrubs about the home; to increase the comforts, refinement, health, and the general welfare of all who own and cultivate land. It tests all new vegetables, and makes known their value. It tells how to raise them in the greatest perfection. Shrubs and trees, flowers, plants of every description, the methods of cultivation to suit the varied and ever-changing conditions which arise, constitute prominent departments.

The insect enemies which infest our field crops, our fruit trees and small fruits as well as vegetables and flowers, and which seem to be rapidly increasing, are subjects of our most careful consideration, and entomology in general is treated in our columns by the ablest specialists in the country.

The Progress and Development of American Horticulture and Agriculture

are always our earnest endeavor. Such efforts as these have brought the Rural New-Yorker to the position it now occupies. The Price of the **Rural New-Yorker is reduced to $2.00 a Year,** payable *invariably in advance.* We have now no club or second price. It is alike to all. ☞ Send for the Fair Number which explains all.

Address RURAL NEW-YORKER, 34 Park Row, New York.

Steam to Liverpool, 10@15s.

DRIED FRUITS.—There is a steady but small demand for all apples and a better movement in peaches. Prices show no material change, but there are a few buyers at the extreme. Small fruits are steady.

Apples, evaporated, new, 13½@14c.; fair to prime, 12@13c.; N. C. new, sliced, fancy, 8½@9½c.; fair to choice, 6½@8c.; Southern quarters, choice, 6@7½c.; State, old, fine-cut, choice, 7@7½c.; quarters, do. 6½@7c.; small lots, 6½@6¾c.; Ohio and Mich. choice, 6½@7c.; Western, fair to good, 5¾@6¾c. Peaches, evaporated, peeled, old, 35@40c.; unpeeled, new, 18@20c.; N. C. peeled, fancy, 21@25c.; choice, 22@23c.; Ga. 22@23c.; Southern, peeled, fair to good, 18@20c.; unpeeled halves, N. C. 8½@9c.; halves, Tenn. 8½c.; quarters, 8½c.; Plums, State, black, 17c.; Southern Damson, 15@15½c. Blackberries, 13c. Cherries, Southern, dry, 19@20c. Raspberries, 28@29c. Huckleberries, 15@16c.

EGGS.—Receipts for the week, 8,006 bbls.; do. last week, 8,383 do. The market is firm for extra-fresh stock and cooler weather gives sellers some independence. Held eggs are slow. Many buyers at this season prefer good limed to doubtful fresh. Some Danish eggs have been shown; they do not compare well with home lots.

Near points, 30@32c.; State and Pa. 27@28c.; Canadian, 25½@26c.; Western, fresh, 26@26½c.; fair to good, 23@25c.; limed State 21½@22c.; Western and Canadian, 21@21½c.

FLOUR.—The week has been unsatisfactory for all dealers. Buyers seem to have been in expectation of a sharp decline, and were partly correct. Prices dropped 5@10c. ₱ bbl. daily and all wholesale prices are weak at the close.

No. 2, $3.50@4.40; State and Western, superfine, $4.05@5.25; city mills, extra, $7.00@7.20; Spring wheat, extra, $5.25@5.65; Spring XX and XXX, $5.75@6.75; patents, $6.50@8.50; Ohio round hoop shipping, $5.60@6.00; trade brands, $6.25@6.75; St. Louis extra, $5.70@6.10; do. double extra, $6.15@6.60; do. family, $6.65@7.00; Southern extra shipping, $5.35@6.25; do. XX and family, $6.40@7.25. Rye flour, superfine, $5.20@5.50; buckwheat flour ₱ 100 lbs. $3.20@4.10. Corn-meal, Brandywine, ₱ bbl. $3.80@3.85; do. Western, $3.25@3.75.

Receipts of flour for the week, 120,931 bbls.; corn-meal 4,515 do.

Exports of flour for the week, 45,589 bbls.; corn-meal 3,475 do.

FRESH FRUITS.—A good many sound lots of apples have been hastened forward and the market feels their weight; few lots exceed $3@3.50 ₱ bbl. Pears are irregular; they have had a marked long season. Grapes steady. Cranberries have lost some of the excitement that last ruled and prices are lower.

Apples, Baldwin, State, ₱ bbl. $3@3.25; Greening, State, $3@3.25; Jersey, ₱ round hoop bbl, $3; N. Spy, State, $3@3.12; mixed lots, do. $2,50@3; King, do. $3.50@4.00; Phœnix, Jersey, ₱ round hoop bbl. $2.75@3. Pears, Sheldon, ₱ bbl. $4@7; Duchess, $3.50@5.00; Lawrence, $3@4; Vicar of Wakefield, $2.50@3.50; cooking, $2.00; Boston bxs, $1@1.50. Quinces, apple, prime to choice, ₱ bbl. $5@5.50; No. 2, $3@4. Grapes, Iona, State, case of 18 3-lb. bxs, $3@5.50; bskts, ₱ lb. 9@10c.; Catawba State, case of 18 3-lb. bxs, $3.50@4; bskts, ₱ lb. 7c.; Diana, bskts. 5½@6c.; Concord, bskts, 2½@3c.; Isabella, bskts, 4@4½c. Cranberries, Cape Cod, fancy, large, ₱ bbl. $10; prime to choice, $8.50@9.50; good to prime, $8@8.50; poor to fair, $6.50@7.50; frosted $3@3.50; ₱ crate, $2.75@3.25; New Jersey, fancy, $3; good to prime, $2.50@2.75; fair to good $2.25@2.50; poor to fair, $1.75@2.25; frosted, 75c.@$1.25.

Old peanuts are in small supply and held very firmly. New are generally inferior in quality; extra prime quoted at about 6¼@6½c. and common at 5@5½c. The crop is thought to be scarcely one-third that of last year. Hickory nuts plentier and declining. Buyers are generally refusing to pay above $1.50 for choice State lots. Chestnuts about steady.

Peanuts, Va., hand-picked, ₱ lb. 7¼@7½c.; fancy, 6¾c.; extra prime, 6½c.; good to prime, 5½@6¼c. shelled, 5@6c.; pecan nuts, 9@11c.; hickory, shell-bark, Northern, ₱ bu. $1.37@1.62, Western, $1.37; chestnuts, Southern, $3.50@4; Northern, $4.50@5.50.

GRAIN.—The upward tone of all important cereals seems to be silenced and as wants are moderate it is not unlikely that later combinations will soon form to improve the movement in export specialties.

Wheat, Spring, $1.25@1.41; Spring No. 2, $1.38@1.40; red Winter No. 2, $1.42@1.43½; red Winter, $1.30@1.45; white Western and State, $1.30@1.41. Rye, $1.00@1.05; Oats, white No. 1, 53½c.; No. 2, 51½c.; No. 3, 49½c., mixed, No. 1. 49c.; No. 2, 48@48½c.; No. 3, 45@47c; Corn, Western mixed, 65@70c.; No. 2, 69@69½c.; yellow, 69@71c.; white, 70@73c. Barley, Canada No. 1, $1.11@1.13; do. bright, $1.11@1.16; State 4-rowed, 97½@$1. Buckwheat, 93@95c.

Receipts for the week, wheat, 800,400 bush.; corn, 737,560 do.; oats, 158,316 do.; rye, 56,900 do.; malt, 35,120 do.; barley, 220,700 do.

Exports for the week, wheat, 616,300 bush.; corn, 434,700 do.; oats, 2,524 do.

The visible supply of grain, comprising the stocks in granary at the principal points of accumulation at lake and Atlantic ports, and on rail, on lakes, on canal and on Mississippi River:

	1881. Oct. 22. bush.	1881. Oct. 30. bush.	1879. Nov. 1. bush.
Wheat	20,857,536	19,108,102	24,822,679
Corn	27,970,474	19,364,145	11,615,264
Oats	4,653,278	5,033,379	3,358,057
Barley	2,523,603	2,611,581	4,360,004
Rye	1,210,863	897,187	967,513

HAY AND STRAW.—Exports for week 875 bales. With a better general offering the demand is not so sharp. Only strictly choice will bring the last top rates. Under sorts of timothy are a shade lower; straw tending lower.

Prime Timothy hay, ₱ 100 lbs., $1.05@1.10; medium Timothy, 80@95c.; shipping grades, 65@70c.; clover mixed, 70@80c.; clover, 60@65c.; Straw, long rye, 75@80c.; short rye, 50@60c. oat and wheat straw, 40@45c.

HONEY.—Cooler weather gives more tone and firmness to the market. The offering however is large and prices are quite full.

HOPS.—The Producers' Price Current says: "Early in the week the market had a firm tone and there was a fair degree of life in the trade. For a day or two past very little business has been done and the market has lost a little of its buoyancy. Advices from the country report a few sales of very choice State hops as high as 30c. It is possible that that price could be made here for a very fancy article, but it would be quite extreme. Brewers are buying very sparingly. Exporters have to go to the interior for the quality to suit them and these prices are above their limits. Old hops are scarce, in good request by ale brewers and firm. London advices report a light consumptive demand; American quoted 140@180s."

Crop of 1881, choice, 28@29c.; good to prime, 25@27c.; fair to good 22@25c.; eastern, 18@27c.; 1880, good to prime, 18@22c.; poor to fair, 10@15c.; 1879 fair to prime, 8@15c.

Receipts for the week, 4,731 bales,
Exports for the week, 1,969 do.

MILK.—Commission sold at a range of $2.50@3 ₱ can of 40 qts; average, $2.68.

POULTRY AND GAME.—Fine poultry is doing well; poor or ordinary lots dull and cheap. Thanksgiving Day will be celebrated November 24. Turkeys must be in fine condition for quick sales. Plump, handsome lots, regardless of size, is the rule. All property should be here three days before the red-letter day.

Turkeys, Phila. prime, 16@17c.; J'y 14@15c; State and W'n d.-p. 13@14c.; scalded, 12@14c. Chickens, Phila. spring, 14@17c.; Bucks Co. do. 14@15c.; Jersey, do. 13@14c.; State, do. 12@13c.; Western, do. 11@12c. Fowls, Phila. dry-picked, 13@14c.; Bucks Co. 12@13c.; Jersey, 12@13c.; State and Western, dry-picked, 11@12c.; scalded, pr, 11@12c.; inferior, 10@11c. Ducks, Spring, Phila. ₱ lb., 16@17c.; Jersey and Bucks Co. 15@16c.; State, 15@16c.; old, fair to good, 10@12c. Geese, Phila. dry-picked, young, 13@14c.; do. old, 10@12c.; State and Western, old 8@9c. Squabs, white, ₱ doz. $2.75@3; dark, $1.75@2.

With liberal arrivals of dressed, cooped stock is too abundant for regular or even good prices.

Chickens, Jersey, spring, ₱ lb. 12@13½c.; State and Penn. 11@11½c.; Western, and Southern, 9@10c.; Fowls, Jersey, State & Penn. 10½@11c.; Western and Southern, 8½@9½c. Roosters, old, 5@6c. Turkeys, J'y and Penn. 11@12c.; Western, 9@11c. Ducks, Jersey, extra-large, ₱ pair, $1@1.25; Jersey, New York and Penn. 60@75c.; Western, 45@55c.; Southern, 45@50c. Geese, Jersey, $1.50@1.75; N. Y. and Penn. $1.25@1.50; Western mixed $1@1.25; Southern, 75c@$1. Pigeons, large, strong birds, 30c.; young, 25c.

GAME.—Supplies have been in bad shape most of the week. At the close there is a promise of a better trade.

Quail, ₱ doz. $2.50@3; grouse, choice, ₱ pair 75c@$1; soft, 40@60c.; partridges, State and Western, 75@90c.; Eastern & Minn. 60@70c.; soft, 40@50c.; woodcock, choice, 65@75c.; inferior, 50@60c.; English snipe fresh-killed, ₱ doz. $1.50; plover, do. $1.25@1.50; rabbits, ₱ pair, 30@40c.; venison, Minn. short saddles, ₱ lb. 15c.; Western, 13@14c; whole deer, 10@12c.

PROVISIONS.—Prices have fallen for all hog products and with free deliveries imminent there is no immediate hopeful outlook.

Pork, prime mess, ₱ bbl. $17@17.25; extra prime, ₱ bbl. $16@16.25; Western mess new, $17.50@17.75. Lard, steam Western, ₱ 100 lbs., $11.30@11.35; prime city, $11.25@11.30. Hams, smoked city, ₱ lb. 13@13¾c.; pickled Western and city, 11@11½c.; Shoulders, smoked city, 8¾c.; pickled, 7½@7¾c. Rib bellies, pickled, 9¼@10c. Bacon, long clear Western, 9½@9¾c. Beef, Western mess, ₱ bbl. $12; packet, $14; India mess, ₱ tce. $25@27. Beef hams, ₱ bbl., $18.50@19.

Receipts for the week—Beef, bbls. and tcs. 1,475; pork, bbls 5,500; cut-meats, pkgs 22,000; lard, do. 18,000.

Exports for the week—Beef, bbls. and tcs. 2,100; pork bbls. 3,550; cut-meats, lbs. 4,096,008; lard do. 3,869,928.

RICE.—Advices from the milling centers note the receipt of rough as in bad shape, and that in dressing there is a greatly diminished yield and a large proportion of low quality. All desirable parcels sell quickly at full rates. East India styles are selling freely in bond, but neglected for home use. The quotations:

Carolina and Louisiana, common to fair, 5¾@6¼c.; good to prime, 7@7¼c.; choice, 7¾@8c.

SEED.—Clover seed is in little better jobbing demand; quoted at 9@9½c. Timothy seed is strong and in demand; quoted at $2.95@3.15. Flax seed has shown a brisk business at the advance that has been quoted for a day or two, and some 60,000 bushels have been taken at $1.55@1.60.

SUGAR.—Quotations are for:

Cut loaf, 10¾@10¾c.; crushed, 10¾@10¾c.; powdered, 10¼@10¼c.; granulated, 9⅞@—c.; mould A, 9¾@—c.; confectioners' A, 9⅜@—c.; standard A, 9¼@—c.; off A, 8¾@9⅜c.; white extra C, 8¾@8¾c.; yellow extra C, 8@8¼c; C, 7⅞@7¾c.; yellows, 7@7⅜c.

TEAS.—The following prices at N. Y.:

Hyson, common to fair	20 @24
Superior to fine	28 @32
Extra fine to finest	35 @40
Choicest	Nominal
Young hyson, common to fair	15 @20
Superior to fine	23 @32
Extra fine to finest	36 @45
Choicest	55 @68

Imperial, common to fair	21 @25
Superior to fine	30 @36
Extra fine to finest	40 @45
Choicest	50 @55
Hyson skin to Twankay, common to fair	14 @16
Superior to fine	17 @18
Extra fine to finest	Nominal
Uncolored Japan, common to fair	15 @20
Superior to fine	28 @35
Extra fine to finest	40 @43
Choicest	37 @55
Oolong, common to fair	16 @21
Superior to fine	25 @35
Extra fine to finest	40 @50
Choicest	60 @75
Souchong and Congou, common to fair	16 @20
Superior to fine	25 @35
Extra fine to finest	40 @50
Choicest	60 @75

TOBACCO.—Market generally quiet.

VEGETABLES.—Exports of potatoes for week 2,345 bbls. Potatoes are in large supply and favor buyers. The arrivals of Irish potatoes from Ireland and Wales via Liverpool have amounted thus far to 3,000 sacks. They consist chiefly of two varieties called Champion or White Rock, and Rose. The former are of medium size with deep eyes, resembling the White Peachblow in shape, but having a yellowish color. The Rose are smooth skinned and about the same shape as our Early Rose but of different color. They are grown in dark soil and present a dirty and rather unattractive appearance, but are said to cook dry and mealy. Some sales of the White Rocks have been made at $2@2.25 ₱ sack, but there is very little demand for them as yet and most lots have been put in store. The Rose are held at $2.50. Sweet potatoes are held firmly but are not active; some fancy Delaware river marks cannot be bought under $3.75 but large sales can be made above $3.50.

Potatoes—Early Rose, Eastern, ₱ d.-h. bbl., $2.75@3; State, $2.50@2.62; do. bulk, ₱ bbl. $2.50; Prolific, Eastern, $2.50; Snowflake, State, d.-h. $2.50@2.62; do. bulk, $2.50@2.62; Burbank, d.-h. $2.50@2.62; bulk, $2.50; Peerless, State, $2.12@2.25; Mercer Eastern ₱ d.-h. bbl. $2@2.25; sweet potatoes, Va. yellow, ₱ bbl. $3@3.25; Del. River, $2.50@3.62; Jersey, $2.75@3.25.

Garden truck fairly firm.

Onions, white bulk, ₱ bbl. $1; yellow, $2.50; red, east, $2.25; red, Chester, $2.25; red inferior, $2; squash, Marrow, ₱ bbl., $1.50@1.75; Hubbard, $1.75@2.25; cabbage, ₱ 100, $6@12; beets, L. I. ₱ bbl. $2@2.25; carrots, $1.50; turnips, Russia, $2@2.25; cauliflower, fancy, ₱ bbl. $5@5.50; average quality $2@2.50; inferior, 75c@$1; pumpkins, ₱ 100 $4@8; celery, ₱ doz., $1.25@2.

WOOL.—The market is ruling quiet but firm. Manufacturers are buying small lots to keep up assortments, but refuse to stock up largely for future requirements at present prices. Holders are confident of being able to sustain the market at current rates, but are not generally anticipating any material advance. Small lots of California Fall clip arrive, but there is little demand for them; quoted nominally at 18@23c. for lambs' and 14@18c. for Fall. Texas Fall generally quoted at 18@23c. according to grade and condition. Pulled wool steady and in very moderate demand.

LIVE STOCK MARKETS.

NEW YORK, Saturday, Nov. 5, 1881.

BEEVES.—Receipts for the week, 12,000 head; do. last week, 15,825 do. Compared with Wednesday's market drovers report very little if any change in common natives, Texans or Colorados, but medium to prime natives a little stronger—in some cases $1 per head and in others nearly ½c. ₱ lb. Buyers and sellers are hopeful of a material change in the dressed beef market which will soon be felt at the stock yards for the present supply under ordinary circumstances would not be excessive. The transactions in Texans and Colorados were at 7@8¾c. to dress 55 lbs.; poor to medium natives 7¼@9¼c. to dress 54@55 lbs. and fair to choice do. at 9½@12¾c. to dress 56@57 lbs.

SHEEP AND LAMBS.—Receipts for the week, 37,448 head; do. last week, 40,837 do. Trade has been light but the weather is favorable for holding and sellers were not anxious to realize. Sheep range 3¼@5¼c; lambs, 5@6½c.

SWINE.—Receipts for the week, 29,387 head; do. last week, 32,781 do. The feeling is better as more hogs needed for city use with cooler weather; corn fed quoted 6@6¼c. ₱ lb.

New Jersey pork, 8@9½c.; city dressed, 8¼@8½c. Pork tenderloins, 11c.

MILCH COWS.—The demand is good for all decent stock. State cows by the lot have sold at $45@55 ₱ head; singles, $70@80.

VEAL CALVES.—Market firm and active at extreme ly good rates.

Hog-dressed country, choice, 13c; fair to good, 11@12c; grass, 5½@6c; live calves, N. J. prime to choice, 9¼@9½c.; do. State, prime to choice, 9@9¼c.; fair to good, 8¼@8¾c.; poor to fair, 6@8c.; Mount Hollys, 7@9¾c.; buttermilks, 4@4½c.; grassers, 2¾@3½c.

Terms for 1881.

FARMING FOR BOYS AND GIRLS. No. 39.

HENRY STEWART.

The Potato.

THE potato is one of the important farm crops. It furnishes a part of the daily food of nearly every civilized person and it is the material out of which a large quantity of starch, gum and alcohol are manufactured. The potato belongs to a large family of plants called by botanists *solanaceæ*, and among which are some curiously diverse kinds of plants. The tomato belongs to the same family as the potato, and so does tobacco. The deadly poisonous plant, nightshade, is also related to the potato, and the family likeness of all these plants exists in the similar formation of the flowers or blossoms. One may notice this in the tomato and the potato as an example of the way in which plants are classed by botanists by this test. It is considered by some persons, and wrongly, that the potato tuber is the seed of the plant. The seed is borne upon the stalks and is contained in small round green balls or seed vessels. The tubes are enlarged stems, and the eyes are simply buds, which, when they sprout and grow, produce stems and leaves in a manner similar to that of many other plants.

The potato is a common farm crop, and when properly grown is very profitable. It, however, rarely receives the attention which it deserves. The average yield amounts to no more than 75 bushels per acre, while with good care 150 bushels may be grown with ease, and in many cases 300 bushels per acre are produced.

The potato thrives upon any kind of soil except a wet one. Sandy loam and gravelly soils produce the finest qualities, the tubers being of high flavor, and containing a large proportion of starch, are dry and mealy when cooked. Clay soils when well prepared will yield good crops, and well-drained black swamp lands produce a fine quality and above an average quantity. This crop requires a deeply-plowed and mellow soil that has been manured the previous year. A corn stubble or a clover or grass sod is most suitable, as the decomposed manure, or the decaying sod, provides the most acceptable food. Fresh manure is hurtful in two ways; it encourages the grubs of beetles which lay their eggs in the manure, and it causes the skin to become rough and scabby in patches, which greatly spoils the appearance and value of the crop.

Fall plowing of the land is of advantage, and if fresh manure is of necessity to be used, it should be plowed in at that season. In the Spring the ground is cross-plowed and this mixes the decayed manure with the soil in a thorough manner. Fall plowing is beneficial in another way, in that it turns up the insects from their burrows in the soil, where the watchful eyes of the crows and other birds, and skunks and other animals, soon discover them.

It is a mistake to suppose that the frost injures the grubs and other insects that are in the soil. These are doubtless paralyzed to some extent by the cold and are less able to escape their many and active enemies, but a few hour's warm sunshine restores them sufficiently to enable them to again burrow in the soil and hide themselves, and the hardest frosts do not occur at the season when plowing can be done. But these and other insects are not killed by the severest frosts, being only rendered dormant, to awake and return to active life again in the Spring. In dealing with our insect enemies it is necessary to learn and understand their habits, and we shall then be able to strive with and conquer them with greater ease and effect.

Seed potatoes are usually selected from the smallest that are sorted out as unsalable. There is scarcely any difference to be noted between the product from small or large potatoes, and even the peelings of potatoes will produce as good a crop as large cuttings, if care is taken not to injure the buds or eyes. The flesh of the seed may yield a little nutriment to the plant, but if the soil is sufficiently good, that will supply the young roots, and the small amount of food that can be procured from the seed is of very little account. Nevertheless, it is very useful and interesting for boys to try for themselves how this crop may be grown under various methods, for what we learn by or through our own work and experiment is of much more use and value to us than anything we may be told or may read of.

Potatoes are much benefited by a moderate application of fertilizer in the drill or the hill; superphosphate of lime, wood ashes, plaster or rich compost scattered about the seed, but not placed directly upon it, start and produce a vigorous growth. When planted in drills, these are usually made about thirty inches apart, and seed dropped about eighteen inches apart in the drill. When planted in hills the distances are about twenty-seven inches each way. The soil should be kept well and frequently stirred, and all weeds should be destroyed when they are small and easily killed. This saves much after labor. When the plants are in blossom all deep cultivation should cease, because then the young tubers are forming and must not be disturbed.

Potatoes "sport" or vary in character greatly, but they do not mix or become crossed in the soil. Crossing can only occur through the fertilization of the blossoms, and the changing of the character of the seed in the seed balls or real fruit of the plant. New varieties are produced chiefly by sowing this seed, and every seed may produce a distinct kind of potato; they are also produced to some extent by the "sporting" or varying of the character of the tuber by accident in some way we cannot understand. The Late Rose was thus produced among a crop of Early Rose, and other instances of the same kind are known.

There is no other crop which can be made of greater interest to a young farmer, both in observing its manner of growth, in studying its peculiarities, and in trying to produce new and valuable varieties. The original home of this plant is Chili in South America, from whence it was brought to Virginia and from thence taken to England where it was long grown as a curiosity and only for food after many years of very partial cultivation. It is now one of the chief necessaries of life.

KINDNESS TO FATHER AND MOTHER.

"Oh, wad some power the giftie gie us,
To see oursels as ithers see us."—BURNS.

I SOMETIMES think that it would be a good thing if we could realize how very ugly our actions are sometimes, but then perhaps we would only feel sorry and go on the same. A while since I called on a neighbor—a frail little woman. Her oldest girl had gone to school; another had a felon on her finger so she was unable to do anything, while the third, a girl of twelve, was too lazy to do anything. The mother had done the washing that morning and churning had to be done before supper. She did not call her twelve-year old to help churn or bring wood or do anything. Another time I called on a woman who had a family of ten to do for. Her youngest child was two months old. The mother was trying to send all her girls to school but she was weak and became weary so easily. I told her there was no great hurry about her girls going to school as they were well on in their studies, and advised her to keep one of them at home. While we were talking they came home. I told them what we had been talking about and they at once offered to stay and assist their mother. They were such a help to the mother whose strength returned and she no more looked so weary.

The mother in the first case soon had an attack of fever which nearly cost her life. Was either place among the RURAL's boys and girls? I hope none of them were there. Ah, children, be kind to mother! No one can ever take her place! No one will ever love or care for you as she does, so take care of her and help her when she needs your help. I do not want boys and girls to have all work and no play, but I want them to remember that they are no better than their parents. If you are able to have servants to wait on you, it is not so bad, but don't make servants of father and mother. One of the brightest thoughts in my memory is of the dear old father on his death bed saying, "She's been a good little girl to me." It is worth more than money to me. No kind act is ever regretted, let it be done to whom we will; therefore, children, let us go on together helping one another in word and deed, sharing one another's tasks as well as sugar plums, and we will be as nearly happy as we can be in this world.

MAGGIE W. THOMAS.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK:—We live at an elevation of 7,500 feet above the level of the sea. The days are warm, the nights cold. Our Winters are not near as cold as in Denver. The thermometer sometimes gets down to 15 or 20 degrees below zero, while in Denver it sometimes falls below 30. We have considerable wind in Fall, Winter and early Spring. We have had little experience in vines or orchard fruits; all we know is what we read, and if we give the opinions of others what shall we say? they are so numerous and contradictory. We tried grapes several years since; one poor little vine survived three years, or until the locusts took it. We set out four grape vines last Spring, two Concords, one Lindley and one Merrimac. They have all done well so far, but we can tell better another year. We set out one little quince last Spring, which bids fair to do well. We shall continue to try fruits until we are sure we cannot grow them here. Thanks for the Pyrethrum roseum seed. They came too late for this year, but we will try them in a hot-bed in the Spring. You requested us to send you a drawing of the seed drill we made. We have had to learn to draw first, but now think we shall be able to send one soon. Yours, ALICK TAYLOR.

Deer Valley, Col.

[It is not necessary that you should excel in drawing in order to send us the outlines of the drill. A rough sketch will do, though, of course, you are to be encouraged in exact drawing.—U. M.]

DEAR UNCLE MARK:—Please include me as one of the Horticultural Club. I sent you a bouquet and some Minnesota plums some time ago, but was taken sick and could not write. The editor of the RURAL requested subscribers to say what part of the paper they would like improved, I would like to see a little *more room* given to the Cousins, for you don't know what a disappointment it is to wait all the week for the dear old RURAL and then find that the poor Cousins are crowded out. Gen. Grant did not treat his relatives that way! I have thirty bushels of lovely pinks and my celery is splendid; but the Red Bud did not grow. How would it do to have the Christmas number devoted to the Cousins? Your niece.

SUSAN MAUDE CULLEN.

[I am glad that the Cousins are becoming so interested in the Youths' Department and want to see it every week. I shall endeavor to have it appear regularly if possible, but sometimes we have to give way to the "big folks," who have so much to say. Many thanks for the invitation to visit your St. Paul home. —U. M.]

PERSONALS.

General Ignatieff's success in life is attributed to his making the most of every business confided to him.

"The only two men of the present century who knew what they desired and willed it strongly," says an English critic, "have been Bismarck and Cavour. The one created Italy, the other Germany."

Ex-Senator Timothy Howe, of Wisconsin, who at this writing seems destined to have a place in Arthur's Cabinet, is troubled with an asthmatic affection, for which he has recently sought relief at the Hot Springs of Arkansas.

The Earl of Pembroke, who is possessed of considerable humor, has just issued the following notice:—"Wilton House. The Earl of Pembroke begs to inform the gentleman or gentlemen who lately shot some of his Canada geese that the common tame goose of this country affords quite as good sport to the shooter and is far better eating."

Field Crops.

WHITE FOUNTAIN WHEAT.

We herewith present an engraving from life of White Fountain Spring Wheat, the original of which was sent to us by Prof. A. E. Blount of Colorado. It has been cultivated in a small way at the Rural Farm as a Winter wheat, and, though late, we have some hopes it may yet prove valuable as a Winter wheat. Mr. R. Parkhurst, of Montana, sent us several heads of a wheat which he said was there called "White Aowse," as we read it.

Fig. 518.

Our readers may remember that we remarked upon the unusually large number of grains in a breast, many of which contained five and a few seven. The heads so closely resemble those of White Fountain that we believe them to be the same. The following note has since been received from Mr. Parkhurst:

"You slightly mistook the name of the wheat I sent you. Instead of White Aowse, it is White Towse. It is a Spring wheat." At your request Prof. Blount kindly furnishes the following information:

"White Fountain (Spring wheat) was received from Ohio last year. The seed received was by no means attractive—soft, dark and very light and shriveled. It is a pedigree variety, having been improved by selection. In Colorado as a Spring wheat it succeeds admirably, producing from four ounces sown 101 pounds of clear hard and beautiful grain. Smooth head, white chaff and stiff straw."

We have only to add that we commend a trial of this wheat to our friends of Colorado Montana, and of Spring wheat growing sections generally. Yet we can furnish no information as to where seed can be procured, beyond giving the addresses of the two gentlemen above named. They are Professor A. E. Blount, Fort Collins, Colorado; R. Parkhurst, Stevensville, Missoula Co., Montana.

NOTES FROM THE RURAL FARM.

Tests With Leading Varieties of Sweet Corn.

All of the kinds remarked upon below were planted May 9, one foot apart in drills four feet apart. No manure was used. The chief object of the experiment was to ascertain the best kinds for succession, so as to give a constant supply of tender ears from the time of the earliest to ripen until frost.

Narragansett was in tassel		July	10
Early Minnesota	"	"	10
Moore's Early Concord	"	"	15
Triumph	"	"	17
Tuscarora	"	"	10
Hickox	"	"	19
Asylum	"	"	22
Evergreen	"	"	25
Mammoth	"	"	26
Black Sugar	"	"	26
Egyptian	"	"	26

Early Narragansett and Minnesota were ready for the table July 20, though the ears were small and imperfect—those of Minnesota being rather more matured. The plants were four feet high to the tip of the tassel. There seem to be two or three days in favor of Early Minnesota. The ears are ready for cooking as soon as the silk browns; while with Narragansett the ears are not ready until the silk is blackened. Both of these bear but one ear of from eight to twelve rows to a stalk. These were the only kinds in use to August 11.

Moore's Early Concord was then ready. The tassel of this kind is in bloom at the same time that the silk appears. It is more prolific than either of the above. The ear is generally 12-rowed and six inches long. The stalks were slender and four-and-a-half feet high.

Triumph was ready for use August 10. This grows about five feet in hight, generally one ear (12 to 14 rows) to a stalk. There are few barren stalks; in silk and tassel at the same time; that is, the silk (pistils) were ready to receive the pollen from the tassels (stamens) when ripe.

Tuscarora ripened at the same time, August 10. Stalks six feet high. Generally two ears to a stalk. Silk and tassel ripe at the same time. Ears long and from eight to ten rows—often widely separated. The kernel is large, oval, rather flat and as white as snow. They do not shrivel as in most kinds of green corn and, though tender, are not sweet.

Hickox grows six feet in hight. Boiling ears ready August 12. They are generally eight to 12-rowed, long and tapering; often two to a stalk, but more barren stalks than in Tuscarora. Silk and tassel matured at same time.

Asylum grows five-and-a-half feet high, one ear to stalk; ripe August 11. The ears are 10 to 12-rowed, regular and well filled out. Silk and tassel matured at the same time.

Mammoth. First ready August 16. Stalks seven feet high. Generally large ears, one to a stalk, 12 to 18 rows. Silk appears before the pollen.

Black Sugar or Mexican: Stalks six feet high; leafy, thin stalks. Often two ears to a stalk; generally eight to 10 rows, eight inches long. They are ready for cooking several days before they show color, though they are excellent for several days after. Silk and tassel matured at the same time. First mess August 17.

Stowell's Evergreen: Stalks six feet high and heavy, shapely ears, 14 to 20 rows, small kernels, ready for boiling August 19. The tassels shed their pollen generally before the silk appears.

Egyptian or Washington Market: Ready for cooking August 19. Stalks seven feet high. Often two ears to a stalk, about 14 rows, short, stubby—well filled out. Tassels usually shed their pollen before the silk is receptive. Though many of the stalks bore two good ears, there were quite a number that were earless.

In use August 22: Egyptian, Triumph (an occasional ear), Tuscarora, Hickox, Evergreen, Moore's Concord (an occasional ear), Mammoth, Black Sugar, Asylum.

In use August 28: Egyptian, Tuscarora, Hickox, Evergreen, Mammoth, Black Sugar, Asylum.

In use September 1st: Egyptian, Tuscarora, Hickox, Evergreen, Mammoth, Black Sugar, Asylum.

In use September 10: Evergreen (a few ears), Mammoth (a few ears), Egyptian (a few ears).

Remarks. It should be noted that for small garden plots, it is better to select those kinds of sweet corn whose tassels bloom and shed their pollen at the same time that the silk appears and is ready to receive it. A small plot of Moore's Early or Black Sugar, for example, would probably set more kernels to the ear than a small plot of Stowell's Evergreen, because each plant of the first two may be self-fertilizing, while each plant of the Evergreen, as a rule, has to depend upon some other plant for pollen.

With the object of having the best kinds of sweet corn for every-day use from the middle of July until frost we should select, as the result of the above tests, the following: Early Minnesota, Moore's Early, Triumph, Black Sugar, Stowell's Evergreen.

There are several kinds which have been offered of late years that are earlier than Early Minnesota. We tested, last year, Mr. Gregory's Marblehead Sweet Corn which gave boiling ears in 61 days. But the limit of earliness in sweet corn, as in tomatoes, seems to have been reached. Any further gain is more than lost in quality, size and yield.

As to quality in the earliest varieties of sweet corn, we could not distinguish one from the other. Triumph is sweet and tender for an intermediate, and Black Sugar and Stowell's Evergreen are probably the sweetest and richest of the late kinds. For family use we choose the Black Sugar as of the first quality; but the ears are rather small and many object to their color. All of the kinds that matured at the same time were more or less mixed. Some of the Evergreen ears were one-eighth Black Sugar, while some of the Black Sugar ears were liberally sprinkled with white kernels. Black Sugar kernels were found one-quarter of a mile distant in ears of Blount and and Chester.

We have never valued grain drills the more for being provided with fertilizer attachments. They are troublesome, cumbersome, and worse than useless. The object of drilling in fertilizers is, as we understand it, to give the grain (wheat, let us speak of) an early start. This may be very desirable, it is true, when for any reason the grain is sown late and a shorter time is allowed before freezing weather begins for the plants to tiller and fortify themselves against the severities of the long winter through which they are to pass. But if the land is fertile—and unless it is wheat cannot prove a profitable crop—and well fitted, and the wheat is sown early, why should fertilizers of any kind be used merely or primarily to give the wheat a start? Except in periods of great dryness, the wheat will start in three or four days and a fertile and well prepared soil will insure a sufficient growth ere the advent of frozen ground and settled winter weather. It is a plain case that if wheat could be sown broadcast and covered as well as by the drill, broadcast sowing would produce a heavier crop than drill sowing—the same quantity of seed being sown—for the reason that each plant would be less crowded by its neighbors and each root would find more nourishment. Fertilizing in the drill—the same as fertilizing in the hill for corn—stimulates the young plant. It induces an excessive growth of plants which, without the fertilizer, would take full possession of the soil. But in the Spring the roots have penetrated beyond the fertilizer, so that the seed-bearing culm or stalk which requires the most food, receives the least. The young plant has been pampered at the expense of the old plant to which we look for our crop of grain. It is equivalent to eating a hearty meal in the morning for heavy work which is to be done the next day. When concentrated fertilizers are sown broadcast, all parts of the soil are treated alike and the roots of the plants through every stage of their existence experience the benefit.

We stated that the fertilizer attachment was troublesome, and this for two good reasons. First, it cannot well be made large enough to hold half, or indeed, a quarter enough fertilizer—so that at almost every bout the lid must be raised and the box refilled. Second, it must be thoroughly cleansed immediately after use or the fertilizer becomes corroded and baked upon the zinc or other lining.

The warm weather continues with gentle rains. Wheat is growing rapidly. Many young apple and pear trees are in second bloom and leaf, thus exhausting the material which should have remained stored through the Winter for Spring growth.

TOBACCO-GROWING NOTES.

Tobacco that is not fully cured at the approach of cold, freezing weather so that some of the leaves on the plants are frozen before they are entirely cured, makes what is usually termed "fat" tobacco. If the stems of the leaves only are green at the time of the freezing, the effect is less disastrous than if the whole or part of the leaf were frozen. Such tobacco has what is known as "fat stems," and may by artificial means for drying, be converted into a valuable article. For the leaves when the body of them is frozen so that they turn black after being dried, there is no remedy, and they should always find their way to the compost heap.

Stripping tobacco is in order as soon after the tobacco is thoroughly cured as the grower can give to it his undivided attention. The plants should not be taken from the poles or laths until the leaves are moist and pliable, and if any "fat" leaves are found, the stripping should succeed the taking down as soon as possible. When stripping, all "fat" or green leaves should be thrown aside, and not placed in bundles or "hands" with sound tobacco for the reason that such leaves are likely to induce sweating after the tobacco is placed in "rank," which sometimes injures the quality of the crop. It is economy to perform the work of stripping as far as practicable during the warm days in November rather than allow it to remain until cold Winter weather, which necessitates doing the work indoors by a fire.

The time required for tobacco to cure depends very much upon the condition of the plants as regards ripeness, when they were cut. Thoroughly ripe tobacco will cure in at least three weeks less time than is required to cure that cut in a green state. This is another good argument in favor of allowing tobacco to become fully ripe before harvesting it, especially is this true with late crops; for experience has proven to many growers that one week in the field while the tobacco is ripening, is worth two weeks after the tobacco is hung in the curing barn, in hastening the process of curing.

A tobacco protective insurance organization is likely to be formed in the Chemung Valley, for the mutual benefit of tobacco growers, in protecting them against losses from hail or wind. Such an organization, if it could be made successful in its working, would put a new face upon the tobacco-growing industry in the locality or district of which it is comprised. The industry is, as it now stands, one of risk, and those who engage in it may find it remunerative or the reverse as fortune favors them. It often happens that the outcome of a whole season's toil and the whole resources of an individual are destroyed in a few moments of snow, hail or wind. A protective organization such as is being considered would make the business fairly safe for those who desire to become members thereof. G. A. G. JR.

Horticultural.

RAYS.

F. D. C., p. 694, draws a very pretty walnut picture. I am not quite so sanguine. So far as my observation extends, black walnut trees for timber require rich land to grow in and will not pay in poor ground.

* *

Of all the sub-evergreens in my garden the pyracantha is just now the prettiest. Dense in habit and thickly clad with deep-green leaves, its shoots are wreaths of scarlet fruit in clusters. It is a highly ornamental shrub for the garden, hardy at zero but unreliable in severer weather, and a valuable hedge plant at the South. It is easily propagated from cuttings of the ripe wood or layers; indeed, the branches that lean upon the ground root freely of themselves.

* *

While the scarlet-fruited winterberries brighten many a Northern swamp and those of the youpon the creek and river timber belts of the South, the Burning-bush, or Spindle-tree as it is likewise called, a wildling also but as a garden shrub used everywhere, is all ablaze with its red fruit, and when seen in front of evergreens, as pines and spruces, is one of the most effective bushes of the Autumn.

* *

Crocuses remind us of early Spring when several species and many varieties associated with snowdrops, Siberian squills, hepaticas and the like, brighten many a garden plot before the frost, and oftentimes the snow, have gone. But there are many crocuses whose time of blooming is the Fall, notably that large and handsome blue one called speciosus, one of the finest of all crocuses, and, too, one that is quite cheap. If any reader contemplates planting bulbs he should get a score or more of this crocus and plant them in clumps. They are perfectly hardy, and in a rich, moderately moist and not too exposed place will continue to grow and blossom year after year with vigor. Besides speciosus, among others the following half dozen are in full bloom with me now, the last week in October: Crocus pulchellus, medius, sativus, nudiflorus, longiflorus and Shoesi. And we might add some meadow saffrons which are crocus-like, bulbous plants with rose-purple flowers, and which also blossom in the Fall, and are very beautiful and hardy.

* *

Apropos of "Horticola's" note on drought-withstanding trees, p. 683, and his reference to the ailanthus, I may say that at Cincinnati some two months ago I was interested in observing how green and bright and flourishing was the ailanthus growing on the steep faces of the high clay hills that surround the city where no other tree seemed to grow at all, and in what a deplorable condition the victims of a vitiated atmosphere, exceptional heat and drought and leaf-vermin, were the elms, lindens, maples, mulberries and other trees that grew within the city parks. As a timber tree for the South the ailanthus has considerable claims, and for that purpose hundreds of acres have recently been planted with it in Kansas. But, even admitting the beauty of its leaves, I have not much favor for it either as a street, lawn or garden tree.

* *

Another excellent drought-withstanding tree is the Osage Orange. Many of us know this as a hedge plant only, but kept to one clean, straight stem from the beginning, with the shortening in of a shoot now and again to preserve the balance and comeliness of the specimen, it makes a handsome lawn or avenue tree. And it will flourish in lands so poor that most other trees would starve in them. But it is very greedy—a far-reaching and gross feeder, when it can get the chance; in fact, the manner in which it impoverishes the soil for several feet, often yards, on either side of it, is one of the greatest faults the farmers find with it as a hedge plant. Indeed the farmers have ceased to regard it as favorably as they used to, and many of them, even where the Osage Orange is perfectly hardy, express a preference for the Honey Locust.

* *

In addition to your answer about cutting-ants, to R. T. J., Austin, Texas, I would say, that when I lived in Texas we were sadly annoyed by these depredators. We used, when practicable, to flood them out by cutting ditches to their "towns" so that when heavy rains fell, flooding ensued. But the flooding process is seldom available. Cyanide of potassium dissolved in water, say two or three medium-sized lumps to a gallon of water, and morning and evening a little of this poured into the mouths of their entrance-holes will kill all that pass that way for some hours. But the most effectual method of destroying them is by fumigating them with sulphur. There are machines for this purpose—injecting the fumes into the "towns," and your correspondent might either buy a machine and use it himself or hire the work done by seme of the people who buy the right to use the machines and make a business of killing ants. But no matter how well he may clear his place of ants he can never enjoy immunity from them, as they prevail in vast numbers all over Southwestern Texas.

* *

At the Phœnix nurseries, Bloomington, Illinois, some weeks ago, I saw thousands of roses in process of propagation from cuttings. The cuttings were little pieces with two eyes and one leaf to each, the leaf was removed from the lower eye as that was the root end. They were then inserted quite thickly in a shallow bed of sand laid on a bench in a little greenhouse, and during the day-time old newspapers were laid over them to shade them from the sun. The atmosphere of the house was kept moist by much sprinkling, and the cuttings, too, and papers were dewed over with a syringe. When I saw them they were beginning to root nicely; in a few weeks more they would be potted off singly into very small pots, and after a while into three-inch or four-inch pots. When established in these second-shift pots they will be in good condition to ship to customers. There was no fire-heat in the greenhouse. A cold-frame would have done as well, but it would be more troublesome to attend to. Later cuttings may be started in the same way, but as they will be slower in rooting, a little fire-heat after they have begun to callus will help them greatly.

* *

And Mrs. Henry Ward Beecher says, page 637, that the toughest kind of meat may be made tender by steeping it for seven hours in vinegar-acidulated water. Perhaps it is not generally known that the unripe fruit of the tropical pawpaw (Carica Papaya) is most efficacious for the same purpose, and has been used for that end in the West Indies and other tropical countries for many years. In Southern Florida, where it is grown a good deal and fruits freely, the unripe fruits are sliced or cut up as we do onions, and fried or otherwise cooked with meat, and not only do they render tough meat tender, but they are a palatable vegetable to those accustomed to eat them. Outside of tropical countries we have barely any practical acquaintance with the fruits of the pawpaw tree; but that is not to be the case much longer, for Mr. Harding, of the firm of Henry P. Thayer & Co., the botanical laboratories, Cambridgeport, Mass., is soon to proceed to Florida for the purpose of making arrangements for the shipping of pawpaw fruit in some form or other to their laboratories at the 'Port. Thus within a year or two we may expect to be able to buy pawpaws in some prepared form from our village grocer. The North American pawpaw is quite a different tree from the species in question, and is known botanically as Asimina triloba. The tropical pawpaw is a peculiar-looking small tree with a soft-wooded, unbranched stem and an umbrella-like tuft of big, deeply-notched leaves, not very unlike much-divided leaves of Castor beans, at the top. They grow very fast, and in Southern Florida I have seen them well fruited when not over six feet high. Should the endeavor of Messrs. Thayer & Co. to introduce the pawpaw in a marketable condition be successful, and a demand arise for their manufacture, a new and important crop will be added to those already grown for profit by the Florida farmers, and, Northern farmers, not only does the juice of the unripe papaws make meat tender, but—forgive me if I say it—it has the reputation of being effectual in removing freckles; tell your daughters so and save your buttermilk.

* *

Some trees and large shrubs growing thickly together as a shelter-belt and screen, and now no longer needed in that way I have just rooted up and cleared away, and will lay out the ground they occupied as a lawn, with some specimen trees upon it. After rooting out the trees and bushes I cleared them away, roughly leveled up the ground, then carted on a quantity of well-rotted, earthy material from the rubbish-heap, trenched the ground to the depth of two feet, at the same time mixing well the compost with the soil and keeping it mostly near the bottom. The bottom spit was merely dug over and left in the bottom. The land was then graded and after that heavily manured with well-rotted manure and carefully and smoothly dug over again, one spit deep. In this condition I will let it remain till next Spring, so that by the influence of rain, frost and snow it will get well compacted and show plainly any bumps or indentations the irregular working and leveling may have left and which will then be easily rectified. In the case of land that is already level, firm and clear, the mere trenching, manuring and digging might not cause, if properly worked, an objectionably uneven surface if laid down to grass at once; but where big holes have been dug so as to get out tree roots, hollows are sure to occur, therefore it is better to wait till Spring before finally smoothing the surface and sowing the grass. The deep working is not only of benefit to the grass, but of vast importance to the trees.

* *

Several of the shrubs that I dug out I planted again; but as their roots were greatly reduced in removal, I cut back their tops in proportion. I cut out all the soft, pithy shoots and weakly, scraggy inner twigs, also old and enervated shoots, altogether or back to vigorous branches, and the tops of all the shoots a little, noting in the cutting to leave no eyeless snags. In planting I worked fine soil in among the roots and packed the earth almost as firmly as if I were setting a fence post. No manure was allowed to come in contact with the roots. The Fall is a good time to set out hardy deciduous trees and shrubs unless in an exposed situation; then I prefer the Spring-time, as I also do for plants that are somewhat tender, and evergreens of all sorts. But if set out in September I am not sure that Spring planting is more desirable. In the event of transplanting deciduous trees or shrubs that are still in full leaf, it may be well to strip off the leaves.

* *

I observe in an English paper a correspondent has just found out that the gloxinia can be grown in the kitchen window. Why, many a farmer's wife in America not only knows that, but ranks the gloxinia as one of her stand-by house plants for Spring and early Summer, just as much as she does Oxalis floribunda for Winter. Hereabouts we have a very easy and satisfactory way of growing gloxinias. We have hot-beds in Spring in which to start seeds of our various tender plants, and which, of course, are emptied before the end of May. Well, when emptied, we add a little more soil and therein plant our gloxinia roots. They soon begin to grow, and that rankly, and there they blossom all Summer long. Thrips and red spiders do not trouble them, neither do they rust. We keep sashes thinly shaded with whitewash over them all the time, but tilted up a little; never water overhead, but, instead, introduce the spout of the water-pot between the rows; indeed, when planted out, gloxinias do not want much water. We give no water after the last week in September, because we want to ripen the roots preparatory to lifting them and storing them in sand in the cellar, shed or elsewhere for the Winter. Seedlings raised in Spring and planted out in this fashion come into blossom in late Summer and make stronger roots than if grown along in pots.

* *

What a grand thing peat muck is for trees and shrubs. Some years ago we got a lot of it for the digging and hauling, and we dumped it some two to three feet deep on a piece of waste land, there to remain till we should use it. In order to reduce it to as earthy a mass as possible I had it turned over once or twice. I had a lot of Austrian Pines and Norway Spruces to plant as a shelter belt in a stiff brick-clay soil. I dug large holes and filled up with half muck and half clay, well mixed together, and the way those evergreens have grown, so strong, is amazing. I have also used it for deciduous trees and shrubs of many kinds, and in transplanting them was often amused to find the enormous ball of roots that came up with each plant. All grew vigorously in the muck-mixed soil. In September, 1876, I cleared a piece of land on which trees and large bushes were growing, to lay it down as a lawn, with, towards the outside, beds of shrubs. I told the men to trench and manure the whole space and add a lot of the muck earth near the outside, where I intended planting the bushes. Then I went to the Centennial. On my return I found the ground prepared, graded and ready for sowing, and that, instead of preserving the muck to the space I told them of, they had used it equally all over the ground. The grass was sown and has grown rankly ever since, but the surface is uneven and spongy. With a good deal of rolling it is well enough as an ordinary lawn, but if required for a croquet ground its spongy, puckered surface would be sadly objectionable. A base-ball ground was needed in town, and a field—a perfect sand bed—was given for the purpose. But how to get a sod of grass upon it puzzled them. Many plans were proposed. Any amount of manure could be had, but that would soon waste through the sand. A layer of brick clay some inches under the surface met with considerable favor; but finally they decided to add a heavy coating of peat muck—the most earthy part—and manure enough. A year later there was a fine sward upon that field and the boys were playing ball upon it. And the grass looks well upon it still. Peat muck is the greatest thing for growing Couch Grass I know of.

Leon.

STRAWBERRY CULTURE.

The varieties of strawberries mostly grown here are Wilson, Col. Cheney, Crescent Seedling, Capt. Jack and others in smaller quantities. In cultivation the first thing to be done is to plow the ground in Fall the last thing before it freezes up for the Winter, as this is sure death to the white grub which would otherwise be sure death to the strawberry plantation. In the Spring, just as soon as the ground will "work," prepare it first by thoroughly cultivating it about three inches deep and afterwards by harrowing, and finally by planking or rolling and marking. I set the rows 3½ feet and the plants about a foot apart in the row. In setting I use a cast-iron dibber made for the purpose: it is about eight or ten inches long and about three inches wide at the top, and quite thin, so that it works into the ground very easily. With one of these dibbers one man can easily set 2,000 strawberry plants in half a day, which is long enough to work at the business at one time, as it is hard on the back.

In taking up the plants *never* throw them into a basket loose; for if the roots dry crooked it makes very slow setting; but, as they are taken up, keep them in the hand till you get 20 or 25, always keeping the roots *straight*. Plunge the dibber down, working it back and forth so as to make a good, smooth hole; then by taking the plant in the left hand it will drop into the hole with the roots deep and straight, just as they are wanted. Then plunge the dibber on the opposite side of the hole and about two inches from the plant, with enough slant to it to bring the point very near the roots at the bottom of the hole, and press the plant in firmly enough, so that it cannot be pulled out by one leaf stalk. Plants set in this way will not wilt, even in very dry weather, but will grow right along.

The after care consists in good, thorough cultivation and hoeing. For a cultivator I use what is called a duck-foot cultivator. The teeth are arranged so that they will only stir the ground, without throwing the dirt on the plants, and are made to go about eight inches deep, thus keeping the ground loose and mellow and in the best possible condition for a thrifty growth of plants, which must be got in order to get a good crop of fruit. Cover plants, as soon as hard freezing begins, with marsh hay or rye straw to keep them from heaving by alternate freezing and thawing.

Fort Atkinson, Wis. R. Jay Coe.

IN THE GARDEN.

We have had a very considerable drought; not over two inches of rain fell in two months' time. The second crops of garden vegetables have proved a partial failure. This is especially true of late-set cabbage plants; cucumbers, notwithstanding the dry weather, did fairly well. Tomatoes are a full crop. Winter squashes are almost an entire failure. While we may regret the dry weather there are valuable lessons to be learned from a drought, that may be worth much to us in the future as a part of our stock in trade. For several years I have spaded about one-half of my garden and the other half has been plowed and in every case the spaded ground has paid the largest profit. It is hard, tedious work to spade ground, but if it pays why not do it? Deep spading insures a crop in a dry time, and the effect may be seen in a garden for several years. A liberal dressing of manure should be given before the ground is spaded, at which time the manure will be well mixed with the soil from the surface to the depth of a foot.

I have found that onions are the easiest of all vegetables to transplant, and that two crops of them may be taken from the same ground in one year; the first crop to be the English multipliers, the second to be the thinnings from the Black Seed onion bed. My way the past season was to mark off the ground and then spread the small onions along the row, letting them lie flat on the ground with the tops, all one way: and then hoe about an inch or two of earth over the bulbs, letting the dirt cover the stalks about half their length. After they got well rooted I reversed the tops and this left them about the right depth to bottom finely.

I have a way of taking up celery plants to transplant that scarcely checks their growth. The plants are in beds three inches apart; I take them up with a trowel, leaving as much earth as possible on the roots of each plant, and lay them down carefully about 50 in a place. I then sprinkle them until the ball of earth is thoroughly wet. They can then be handled without the dirt dropping away from the roots. I handle them by the tops, placing them on a wheel-barrow to put them in the trench. I often scatter several hundred before transplanting, as there is no danger of their wilting if left for several hours, provided the sun does not shine on them after they are set out. I give the plants a good watering and that is all they ever get except from the rain. I partially shade them for a week or two by means of laths. I take an armful and drop one every 3½ feet across the trench and then lay two parallel with the rows of celery

directly over the celery, letting the ends rest on the laths lying across the rows, leaving the laths about their width apart. This gives the celery a partial shade and helps it wonderfully in starting. A. WAKEFIELD.

Oneida Co., N. Y.

NOTES FROM THE RURAL GROUNDS.

The Witch-Hazel

WE do not know that the Witch-Hazel is ever spoken of as an ornamental shrub and yet, a few days ago, as we were looking at a thicket of these plants in full bloom, it occurred to us it might well be used with good effect. The flowers borne on hardy shrubs, now that the leaves are falling and severe frosts have occured, are not to be despised even though less showy than the most indifferent of those which bloom during the Spring or Summer. As shown in the illustration, Fig. 519, the Witch-Hazel flower is peculiar. The four yellow petals are less than an inch in length, and less than a line in width. But three of these flowers are clustered together upon a single flower stalk, and the stalks are often close together—so that the shrub, after all, makes quite a showy appearance. The Witch-Hazel begins to bloom just as its leaves are falling and continues in bloom long after every leaf has fallen. The fruit, however, is not perfected until the next Spring and often persists until Fall when the shrubs are again in bloom. It may as an ornamental shrub be considered the opposite of the favorite Forsythia viridissima offered in every nurseryman's catalogue. This unfolds its golden flowers in the Spring before the leaves appear. Hamamelis virginica is its botanical name, and it is a close relative of our Liquid-ambar or Sweet Gum. It grows from five to ten feet high, growing in many parts of the country sometimes on hillsides, sometimes along streams. Infusion of the leaves is thought a valuable medicine in cases of bowel complaints and hemorrhages. There are several Japan varieties of the Witch-Hazel, but the difference, so far as we learn, is chiefly in the size of the leaves.

Those Picotees, etc.

I want to say how much pleasure I have had from the picotee Rural seeds. The package claimed to contain carnations, but they all came up picotees, eight varieties, and they are blooming yet as gayly as in August. All they lack is fragrance—which the pansy also lacks—but one shouldn't expect everything. Anaximander was so well pleased with the Rural Branching Sorghum that he intends to have it among his crops next year. The White Elephant Potato came very near being entirely swallowed up by a freshet, but divided portions stuck in their places and were dug up in due time a respectable little crop that is stowed away for next year's planting. The long drought was unfavorable for the asparagus seeds—there are one or two dozen plants however; so, all in all, we have abundant reason to have pleasant and profitable reminders of the RURAL NEW-YORKER for many a year to come. While I am on the subject, I wish also to report concerning the Cuthbert Raspberry plants received two years ago from the RURAL. Both are now large bushes and bore well the past Summer. We were delighted with the fruit, it being so much larger, firmer and freer from seeds than either of our other varieties of red raspberry—the Antwerp and Philadelphia. Indeed, it seems to be the *best* red raspberry, in *every* respect that has as yet made its appearance, and it seems scarcely worth while to cultivate any other. The bushes had only the ordinary protection of manure about their roots last Winter, which was, as you know, of extreme severity, but the canes were not injured.

Bryn Mawr, Pa. MARY WAGER-FISHER.

Challenger Lima Beans.—See Page 780.

We present a sketch of a bunch of the Challenger Lima Bean offered in the next Free Seed and Plant Distribution of the RURAL NEW-YORKER, which was made from a specimen sent to us by the farmer with whom this variety originated—or rather by the farmer who originated the variety, since it is the result of many years of selection. Our own plot of this variety, owing to the drought, perhaps, quite disappointed our expectations—the yield being little in excess of that of well-known kinds of this valuable bean.

The Vineyard.

AN ERROR CORRECTED.

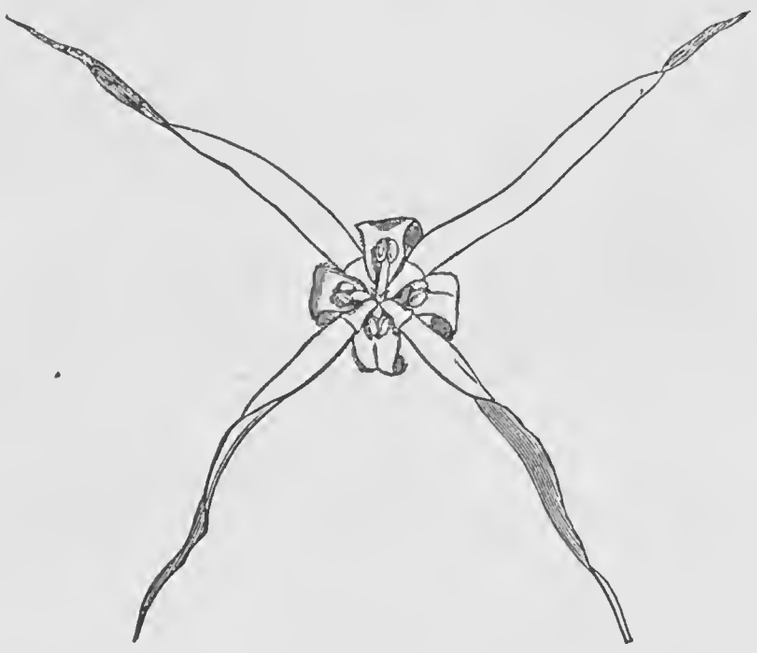
Mr. Marvin's New Grapes.

IN the American Pomological Society's report on new grapes, an abstract of which I find in the RURAL of Oct. 29, after giving a partial list of the exhibits—including six of my own, among them Centennial, and Sharon—I find this remark: "All these varieties show indications of foreign parentage?" As far as my own exhibit is concerned, I can positively say there is not a particle of foreign parentage in them; they are pure native grapes every one of them. To show this, I invite the committee and any interested botanist or horticulturist to call upon me next year, to inspect my vines, and I will convince them of the wrong that has been done me. I have always opposed using the foreign to improve the quality of our native grapes. The files of the RURAL will bear me out in this. [It is true.—EDS.] Indeed I have endeavored I may say to champion the fight against any admixture of the two classes. If there has been no mistake made in the reporting, I can account for this opinion in but one way:—

Our horticulturists have for so long a time been studying the Northern type of our Labrusca grapes, and hybridizing them with the foreign, and they have studied the Northern type of our Æstivalis grapes, and their grand capabilities, and the Southern type of our Labrusca grapes, and their capabilities so little, and so casually, that when they see anything superior to the Concord type, they are surprised, and immediately jump at a conclusion, and attribute the good quality to the foreign vines.

In one sense this is an unconscious tribute to the value of my long endeavor to improve our native grapes, and I accept it as a compliment to their improved quality. But there is another view of the matter, that I must also notice. I took the pains to attach a card to a cluster of each variety exhibited, giving its botanical class. If the committee saw and read this card, they thought I was attempting to palm off foreign hybrid for native grapes; but I cannot believe this to be the case. I have the utmost respect for each of the several gentlemen composing the committee, and I refrain from saying anything further than that I consider it simple justice to correct this imputation against the value and usefulness of my labor. For the committee themselves I believe will all cheerfully agree with me, that when our native grapes have the quality of the foreign hybrids, they are far superior to them. D. S. MARVIN.

Watertown, N. Y.



THE WITCH-HAZEL—(Expanded Flower, mag.)—Fig. 519.

Farm Topics.

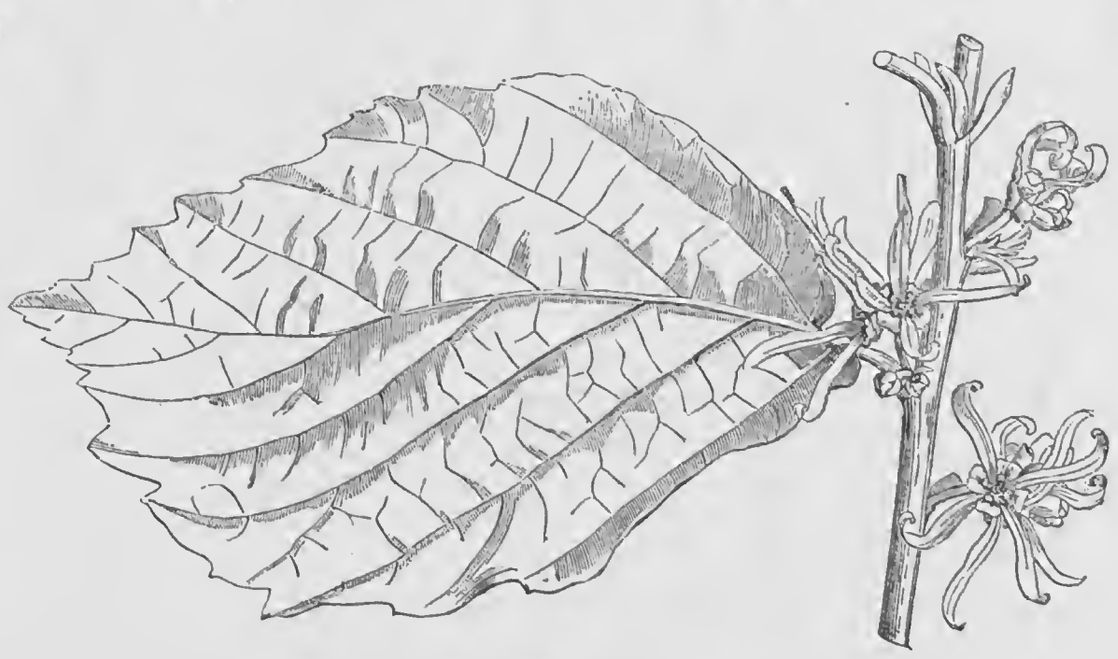
A FARMER'S RETROSPECT.

MANY of your gray-haired readers will remember how in their boyhood barn-floor work was done. Then the grain was cut with a cradle, bound by hand, and carried in on a hay-rack. The sheaves were then pitched off and spread on the floor, and the grain was beaten out with flails. Then the straw was raked off, and the grain was winnowed by pouring it from one measure to another as the fan was turned to raise a wind. The thrasher poured his thrashed grain out from a large wooden hand-sieve or shook it through a coarser one called a riddle, and by repeating this slow, clumsy, laborious winnowing and supplementing it with a skillful whirling of the grain in a sieve too fine to let it through, he got the grain clean enough to measure up for the granary and to determine the thrasher's pay. This whirling of the sieve of grain was called row-ing (pronounced *rou*), and was an art attained by long practice and which only old hands could do well. Thrashing machines were coming into use, and winnowing machines, too: but they were great rareties, and as they took the whole long Winter's work out of the hands of the poor thrashers they were looked upon by them as so many dragons threatening to take away the only means of existence from them and their families. Many barns were set on fire where these "cursed inventions" had a place. Now in the same country the machines do all the thrashing, requiring but a few men a short time, and even the cottages where the thrashers once lived have almost entirely disappeared. Their descendants find work in factories. W. G. W.

The Herdsman.

NOTES BY A STOCKMAN.

IT is stated that an effort will be made at the Chicago Live Stock Exhibition to determine what "handling" indicates. "Every one" was supposed to know this years ago, who knew anything about stock. Dr. M. G. Ellzey, of Washington (a name hitherto unknown in this connection, I believe), is reported to have said somewhere and somehow, that "it would be a good move in the right direction for the agricultural colleges with their model farms, if there is any man about them who knows how to judge of and describe the handling of a beast when alive and how to make an intelligible description of the carcass when slaughtered."



THE WITCH-HAZEL—Leaf and Flowers.—Fig. 520.

Now, if Dr. M. G. Ellzey is a real docto that is, a doctor of medicine and surgery, he ought to know something about anatomy; and yet he says, or is reported to say, "There is neither anatomical nor physiological connection between the hair on the perineum of the cow and her lacteal glands." Now, a real doctor should know that the same important artery which supplies the lacteal glands with blood, supplies also the capillary vessels which nourish the skin and hair of the perineum, and that if the circulation of the one is largely developed, the arteries with the veins are, as we know they are, largely developed in some cows, there is both an anatomical and physiological connection between the udder and the escutcheon, or the hair on the perineum. Now, I would like to say to Dr. M. G. Ellzey that these reported remarks are utter foolishness. Why should persons and doctors be ever casting slurs upon our agricultural colleges? What agricultural colleges have model farms and a choice of fattening stock to study "handling" upon? and what sort of a description of a carcass does this doctor suppose to be an intelligible one? Does he want to hear about "the thick crops," the "full bosom," the "sweet, delicious handling," the "wealth of hair," and all the other slang and absurdity of some of the English amateurs of live stock, introduced here?

HERE comes our jolly butcher who knows all about stock and carries a *pocket* edition about him of what he knows, and he grabs a handful of skin which folds loosely in his grasp and slides and slips over the soft, mellow, thick, deep, unctuous and elastic coating of fat under it, and he pokes his three fingers deep into the yielding hide and then he knows that there is meat there and plenty of fat marbled and interlarded with it.

BUT he shakes his head when he comes across a beast whose hide seems to be drawn tight over the ribs and stretched until it is as thin as a drum head, and he knows that although there may be fat there it lies by itself and the meat will have none of that marbling which makes it so juicy and tender and melting in the mouth, and which pleases the butcher because it cuts up without waste and every ounce of fat is meat and not tallow.

Handling? Well I should smile to think what those jolly old Short-horn men of half or three-quarters of a century ago would have thought and have done had it been whispered to them that at a fat cattle show to be held at Chicago in 1881, it was going to be determined what handling indicates. There would have been some profane remarks about Chicago and other matters and things, no doubt.

WHAT is the use of being a giant if one does not use the strength of a giant? And what is the use of having a pair of Norman or Percheron or Norman-Percheron—or whatever else they may be—horses weighing more than two tons and keeping them drawing a plow that makes but one furrow. With a pair of those monstrous and powerful horses the prairie farms should use gang plows having at least two, if not three, shares, and so do the work of two or three pair of small horses.

MORE than two hundred Norman horses are to be exhibited at the Chicago fair, while at the New York State fair only 53 of Norman-Percheron and Clydesdale horses were shown. This shows how popular this class of horses has become in the West during a few years past. But what is the use of such big horses unless they do a proportionate amount of work? And we have so far heard a good deal about the horses, but not so much yet about the amount of work they have done.

THE enterprise enlisted in the business of importing these French horses is something remarkable. Two hundred and ninety head, valued at about a quarter of a million dollars, imported in one steamer, says a great deal for the importer and for the steamer as well.

IT makes some difference whose ox is gored. That old fable will never be worn out so as to be laid on the shelf. It is applicable every day. Once upon a time those selfish and jealous English people were hardly pushed by some American cattle men who crowded their beeves into the English market and raised a very hot competition with the native beef. And these English people raised the cry of pleuro-pneumonia and stopped the business to a considerable extent and so disgruntled the Western cattle men. And in course of time some Eastern farmers, who had a lot of calves and little feed to spare, sent these little creatures to the West, where there were not enough calves to consume the abundant fodder. This made a serious competition with the Western cattle men who wanted to sell their own calves. And so they raised a cry of pleuro-pneumonia, and charged these poor little calves with their parents' sins, just as the wolf charged that little lamb with roiling the water before he was born.

"ALL is fair in love and war"—and business. And Eastern men should by no means get their "backs up," but go to work in a friendly, business-like manner and do precise-

ly what the Western men did, and that was, prove very conclusively that there was no pleuro-pneumonia in theirs, and that there was no healthier place in the world for cattle than the Western States. And they should get a high official to use his official influence to support the fact that pleuro-pneumonia in the East is totally unknown to the inhabitants and that they themselves are living in daily dread and fear of infection from the West of Texas fever and some other diseases which have heretofore come from that way, but about which very little fuss has been made. The great West scarcely owns all the United States Government and the East has some claims upon it, too.

YET the West is a great place. It is able to feed the whole world with the help of a few men from the East now and then, and occasionally a few thousand thrifty, healthy calves from the East to fill up their broad pastures. And so let us have peace.

English and American Mutton.

The difference generally between these is so great it is not to be wondered at that any one who has tasted the former should be dissatisfied with the latter. The English as well as the Scotch mutton sheep, are so much larger than the American that they give fuller and more desirable joints for roasting and boiling, and especially a greater amount of tender lean and very juicy chops for broiling. These can be cut an inch thick, and yet cooked evenly through; whereas the American usually comes off the gridiron half burnt on the outside, dry, stringy and tough within, proving not only unsatisfactory but most unprofitable meat for consumption.

We are glad to observe that a considerable impetus has been given lately to the improvement of our sheep for the shambles. More of the well-bred mutton sorts have been imported during the past 18 months than for some years before; and we hope they will be followed up rapidly by other importations and bred and crossed here with such care on the natives as to shortly furnish our markets with good mutton as plentifully as it is now done in Great Britain.

Angus Cattle at the St. Louis Fair.

I observe that these black Polled Scotch cattle were the most numerous of all exeept the Short-horns, which were exhibited at the late great fair at St. Louis. I am glad to see the attention of Western breeders at length fully roused to the merits of this distinguished class of animals, to rear steers for the British market. The beef of no breed brings so high a price there or is so quick of sale, except that of the Scotch Highland or Kyloe cattle. But these last are of a much smaller size and have long, sharp horns, both of which are so objectionable. This sort of animals could never find favor with American breeders.

The best Angus cattle are nearly as large generally as Short-horns—some are fully so—and being destitute of horns, breeders who have tried them on the great Western Plains say they can be reared and marketed there for from 10 to 20 per cent. less cost than horned beasts. This of itself is a handsome profit. They can also be stowed so much closer in railroad cars and on board ship that the cost of transportation is considerably reduced, and there is less loss of them by goring and other injuries to which cattle are subjected when sent to market. A.

Dairy Husbandry.

TESTING MILK.

HENRY STEWART.

THE use of the lactometer, or rather the hydrometer or water measure for testing milk is a delusion and a snare. This instrument is constructed for measuring the relative specific gravity of liquids, pure or distilled water, water at a temperature of 60 degrees being taken as the standard. The so-called lactometer or milk measure is in its very name a fraud and a delusion, because it does not in reality measure milk, but merely the water in it and the specific gravity of the fluid which shows the quantity of solids in solution or suspension in it. Milk is a complex fluid containing a certain proportion of water, mixed with an uncertain proportion of various salts some casein and some sugar which are heavier than water, and some fat and volatile oils which are lighter than water. Now, it is an utter impossibility for any measurer of specific gravity to ascertain what the true relative gravity or weight of a liquid should be when it contains every time a different quantity or proportion of each one of these added substances and each one differing somewhat in its own specific gravity. For instance, we take the milk of a "native" cow, that will not show more than three or four per cent of cream, and which at certain stages of her condition of pregnancy is unusually charged with salts, and it will show a high specific gravity, being much heavier than water, in the ratio perhaps of 1.035 to 1.000 or three-and-a-half per cent.

Then we take the milk of a fresh Jersey cow, a rich butter maker, in which there may be 25 or 30 per cent of cream and, of course, a less ratio in proportion of salts, sugar and casein, and it may show a specific gravity of

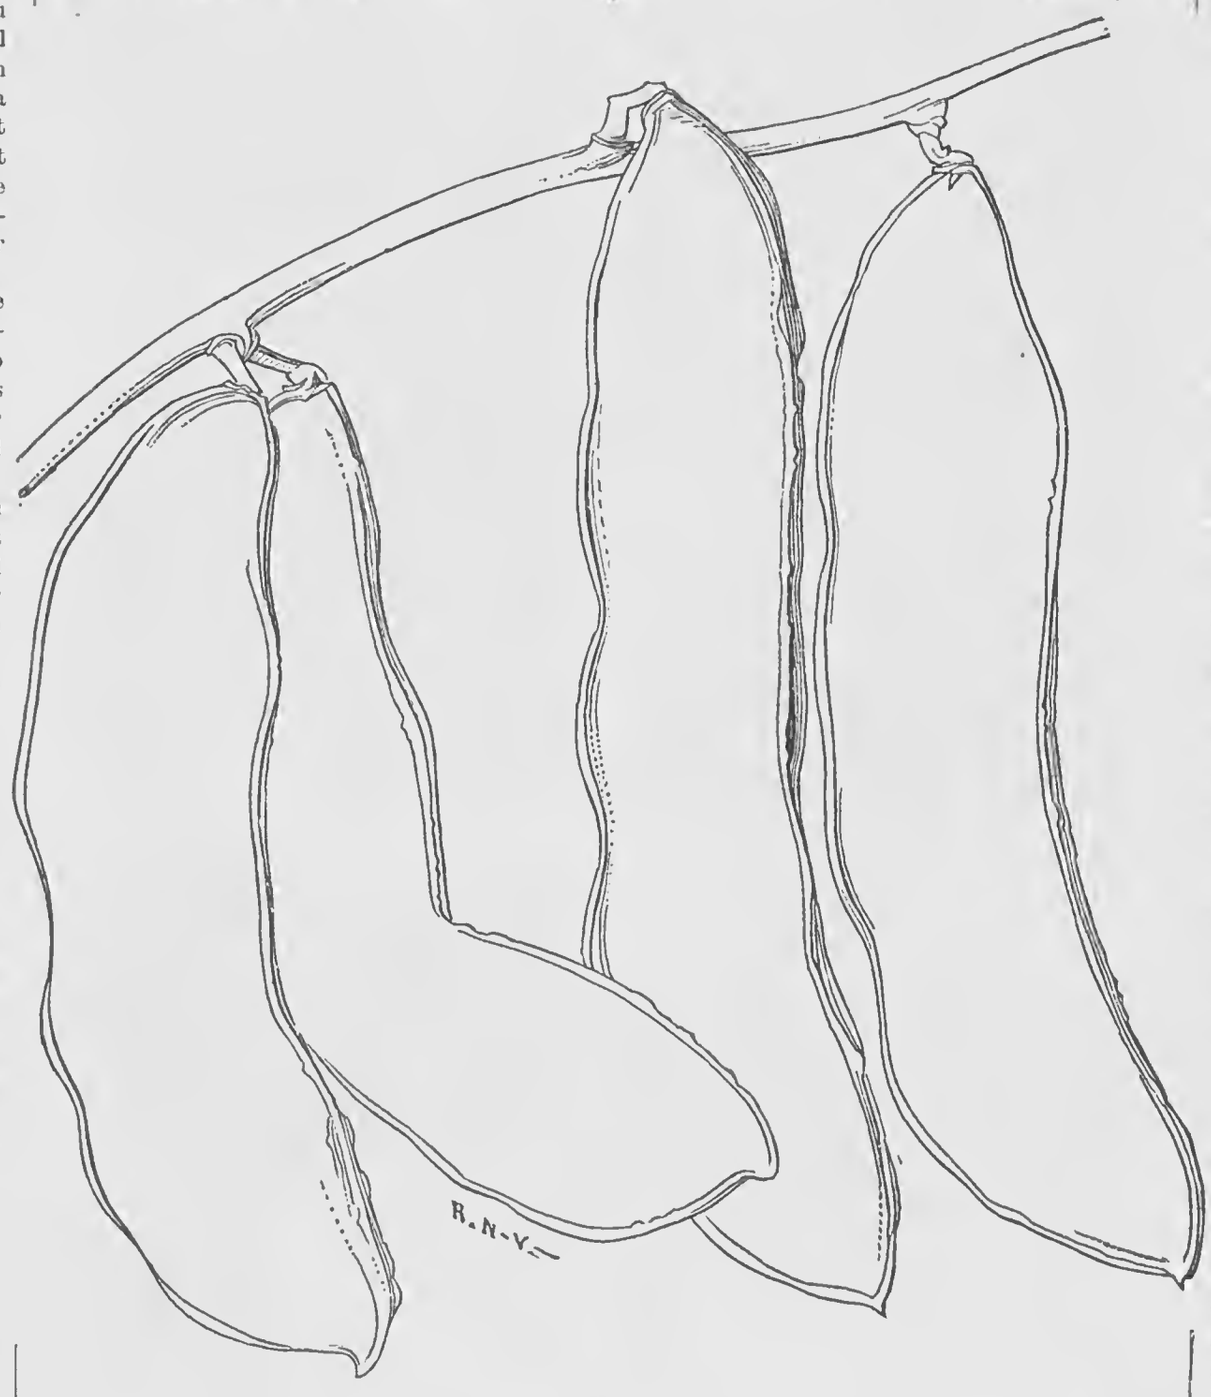
THE PIOSCOPE.—FIG. 521.

only 1.025, or one per cent less than the other milk. Then we take this rich milk and add water in considerable quantity (I do not stop to work out the equation algebraically, but some of your readers who have more time than I may find out how much water would be needed), and this rich milk is raised in specific gravity equal to that of the less rich milk. Then the hydrometer or lactometer would say that these two milks were of a better quality than the rich Jersey milk, because they scaled 1.035. This shows what an unreliable test is the lactometer, which is simply a hydrometer with the scale marks varied somewhat. Unfortunately the lactometer is the judicial test in courts, and many a milkman or dairyman has been unjustly convicted by its false testimony.

The cream gauge is a good test of the quality of milk, but it requires much time to work, and it is uncertain because different milks throw up the cream with different degrees of rapidity and a rich milk, after 24 or 36 hours, might be adjudged poorer than another which has put up its cream more quickly. So the cream guage is a faulty test. I have been experimenting recently with a new milk tester made in Germany, a specimen of which was kindly sent to me for trial by my friend A. P. Sharp, of Baltimore. This is known as the Pioscope, (Heeren's Milchprüffer), and it works on the basis of the density and opacity of the milk. It consists of a jet-black, circular plate of vulcanite, having a circular shallow cell in the center (See Fig 521). The two heavy rings in the center represent the central cell surrounded with a low rim and a concentric rim a short distance,—about one-eighth of an inch—from it, leaving a shallow, circular groove between them. A circular glass plate is made to cover this vulcanite cell and its border. The center of the plate corresponding to the cell in the vulcanite plate, is clear and transparent; the rest of the plate is divided into six segments each colored in shades graduated to match the different qualities of milk: the first is marked "cream;" the next, "very fat" or rich milk; the next "normal:" the next, "poor" milk, and the last, "very poor." The central cell being filled with milk to be tested, the glass cover is laid on and presses out the surplus of milk over and above the requisite film to fill the cell. The jet-black vulcanite, of course, shows through this thin film of milk in the precise proportion to its density, and the milk to be tested is matched in color by the colored segments of the glass plate.

Rich milk from one of my cows that yields 12 pounds of butter weekly, appears on the Pioscope much lighter in color than normal milk and scarcely so light as the very fat milk; the difference is, however, scarcely to be distinguished. One drop of water added by means of a pipette to this milk, reduces it at once to the shade of poor milk and two drops bring it to a darker shade than very poor. The cell holds about 10 drops from the pipette. Several tests with other cows' milk result in the same way. Five per cent of water added shows very distinctly, and 10 per cent carries it to the bottom of the scale. Except an accurate chemical test by analysis I don't know of any other that is so sure and sensitive as this, and it seems to be one that may be used with satisfactory results in place of the uncertain lactometer and the slowly acting cream gauge. It is instant in effect and can be used and mark the result in one minute after the milk is drawn from the cow, and indeed it is then only that milk can be tested with any accuracy because its condition changes every moment after that.

Another test depending for its effect upon the same principle, viz., the density of the milk, was brought into use a few years ago, but it failed because of the uncertainty of its elements. It consisted of two small sheets of glass cemented to wooden sides and bottom, leaving the top open and a space between the glasses forming a narrow cell about a quarter of an inch from wall to wall. This was mounted on a graduated slide and a lighted candle was placed at the end of the slide. The cell being filled with milk, was moved on the slide until the light could be seen clearly through the milk. It is obvious that the result depended upon two very uncertain elements viz., the dullness or brightness of the light and the sharpness or dullness of the eye of the observer, besides the gradations of the light would at any rate be so very difficult to estimate that no accuracy at all could be secured. This milk tester soon disappeared from view and its light went out. Neither of these objections apply to the Pioscope the action of which is based upon conditions which are always equal and certain.



THE CHALLENGER LIMA BEAN.—FIG. 522.

The Horseman.

NORMAN-PERCHERON HORSES.

THE ancient county of Le Perche formed part of the old province of Maine in France, and was bounded on the north by Normandy. Since the subdivision of the old French provinces into departments by a decree of the National Assembly, January 15, 1790, the old division Le Perche has been distributed between the departments of Orne, Eure-et-Loire and Eure, its ancient capital, Montague, being still one of the chief towns of the first-named department. Ever since the eighth century at least it has been always famous for its draft horses called Percherons. With regard to the origin and development of the breed there is some dispute, as there is with regard to all races that date back to the Dark Ages. Some say it owes its commencement to a cross of pure Arabian blood upon the heavy draft horses of the country as far back as 732, when Charles Martel defeated the Saracens in a great battle a few miles to the northeast of Poitiers, capturing a vast number of their cavalry horses. Some of these, tradition says, were crossed on the horses of Le Perche and from this commixture of blood springs the Percheron. The race is said to have been still further improved in the fourteenth century by crosses of Arabian war horses brought home from the Holy Land on the return of the French Crusaders. In course of time the horses of Le Perche and those of the neighboring province of Normandy, which partook more or less of the same ancestry, became mixed from frequent intercrossing, and the horses which of late years have been so largely imported from France for the improvement of American horses, have been to a great extent the progeny of these coguate races, and hence have been widely known as Norman-Percherons. Whatever admixture of blood has been made, however, occurred so long ago that the present breed known by that name is considered decidedly pure, the horses belonging to it being strongly prepotent, that is, having the capacity of transmitting their special characteristics in a marked manner to their offsprings.

The following are briefly the points of a Percheron horse:—Head short; brow broad, with a hollow between the eyes and nostrils, sometimes called a dish-face; neck long, well arched and heavy, but, like the head, in keeping with the general massiveness of the frame; back short; barrel well ribbed-up and round; legs particularly short from the knees and hock downwards, heavily haired, without the fetlocks and feet being shaggy; sinews iron-like; feet hard, sound and unusually exempt from disease; hight from 14¼ to 18 hands; color generally gray; weight from 1,400 to 1,800 pounds, though sometimes horses of the breed run over 2,000 pounds, but in such cases there is generally considerable doubt as to their being pure-bred. Indeed, there is excellent authority for the opinion that of all the horses over, say, 1,800 pounds imported from France into this country few if any are pure Percherons; but, as Mons. Lavalard says, they are mostly either descendants from horses imported into Le Perche from Bologne or Belgium, or from other parts of France or bought up in different parts of France for exportation to the United States. In view of the fact that cross bred animals, however well formed and however closely resembling their pure-bred parent, are always very uncertain in the character of this progeny, it is highly important that every purchaser of a Percheron or Norman-Percheron horse intended for breeding purposes, should have assurance of the purity of its descent. The character of the importer is the main reliance in this case, and of these the most extensive, widely known and successful is Mr. M. W. Dunham, of Wayne, Du page Co., Ill., who has on his two farms—one of 600 and the other of 2,000 acres—one-fifth of all the Percherons ever brought to this country.

Entomological.

THE PINE-LEAF MINER AND ITS PARASITES.

PROFESSOR J. HENRY COMSTOCK.

A LITTLE MORE than seven years ago I first observed that the Pitch Pines (Pinus rigida) at Ithaca, N. Y., were infested by an interesting little insect, a caterpillar which is so small that it can live within the leaves—or needles, as they are popularly called—of this tree. The softer inner part of the leaves furnishes the larva with food; the firm outer layer, retaining its form after the inner part has been eaten out, constitutes a tube within which the larva lives. Thus a single leaf serves both as house and pasture for the tiny creature. The part of the leaf which is eaten out dies and turns brown, rendering the work of the larva conspicuous.

What are in all probability the eggs of this insect have been found deposited singly near the base of the leaves. They are nearly round, flattened on the side of attachment, and slight-

ly so on the opposite side. Their average diameter is one-twentieth of an inch. The general color is reddish-brown, differing in intensity with the stage of development. The surface of each egg is marked with numerous delicate ridges, which meet at the center. We have not proof positive that these are the eggs of this leaf miner, but their size, appearance and place of deposit seem to indicate that they are

The work of the larva is well shown in the engraving, Fig. 523, and also the larva itself, highly magnified. From a study of the mines the larva appears to burrow towards the end of the leaf first. Should it arrive at the end of the leaf (and it almost invariably does) before attaining full growth, it reverses its position and mines towards the base. The hole of entrance and of future exit is apparently in all cases enlarged and the excrement pushed through, as there is but little to be discovered in the mine, while it can always be found in a greater or less quantity at the opening or on the leaves below. No instance has been observed in which one larva has injured more than a single leaf of the Pitch Pine, but a specimen of this insect was found in Virginia upon the common Scrub Pine (P. inops), the leaves of which are shorter and more slender than those of the Pitch Pine, and, from observations made upon this specimen, it would seem that one leaf, if small, does not afford all the food needed by a larva.

When found, on the 1st of January, this specimen was hibernating, the mouth of its burrow being covered with a thin silken curtain. Six days after, being transferred to a warm room, it was found that this curtain had been broken and the insect had left its mine. It was soon found on another leaf and the same day formed a new burrow, where it continued to eat until January 23, at which time it had completely excavated the leaf. After this date all operations appear to have been suspended, and there were no signs of life in the burrow until March 3, when a parasite issued.

Leaves of Pitch Pine are frequently observed to be completely mined out, and nearly full-grown larvæ are occasionally found crawling about over the leaves and twigs; so it seems probable that with this species of pine also two leaves may sometimes be successively mined by the same larva.

The full-grown larva is nearly one-fifth of an inch in length. Its color is light brown, with the head and the shields on the second and last segments black. The body is clothed with a few delicate hairs. The form of the larva is shown in the cut. Upon reaching full growth the larva spins a slight covering to the mouth of the mine and retreats a short distance above it. There, after spinning a few supporting lines of silk, it becomes transformed to a long and slender pupa, which is light brown at first, but afterwards black. When removed from the mine the pupa is very active, jerking the short part of the abdomen, which extends below the wing cases, from side to side with rapidity. The form of the insect in this stage is shown in the upper left-hand corner of the engraving. It forcibly suggests that the creature has been developed in narrow quarters. The duration of the pupa state is from 10 to 14 days. The moth makes its exit from the pupa shell without disturbing the position of the latter, leaving it attached by its threads some distance up the mine, and works its way to the entrance. The moth is represented in the lower part of the cut, much enlarged. Its expanse of wings is three-eighths of an inch; its color is brownish-yellow, with the fore wings marked by three white bands. The scientific name of the insect is Gelechia pinifoliella.

I have observed this species more abundantly on the Pitch Pine in New York than elsewhere. But it infests several species of pine; and is found, to my knowledge, in all of the Atlantic States from New York to Georgia.

When I first observed it at Ithaca it was not very abundant; but it increased steadily till two years ago the Pitch Pines in this vicinity were so badly infested that the general color of the foliage was brown instead of green, nearly every leaf being mined by the larvæ. It seemed at that time as if the death of the trees must soon follow, as there was no practicable way of protecting them from the pest. The larvæ, working, as they do, within the substance of the leaf, are beyond the reach of the substances which are used to destroy insects Fortunately, however, although the little leaf miner is protected from the attacks of man, it is not secure from the enemies belonging to its own class. I found three species of parasites preying upon it. And to-day, as I look from my laboratory window, I see an excellent illustration of the important results brought about by these parasites. The trees which two years ago were brown and apparently dying are to-day green and vigorous. A close examination reveals the presence of a few leaf mines, but not one where there were fifty two years ago.

Cornell University, Ithaca, N. Y.

Miscellaneous.

RURAL BRIEFLETS.

A WRITER in the Ohio Farmer pokes fun at our statement that in order to improve a given variety of wheat, kernels should be selected from the middle of the ear or a little above it. "Now just fancy a man," he says, "thus preparing the heads for a hundred bushels of seed wheat. Wouldn't he have a a nice job?" We have found that the flowers just above the middle of a wheat head are the first to bloom and that the kernels are therefore the first to mature. In seeking to improve a given kind of wheat, we cannot begin with the entire field. It must be done either by selection or cross-breeding. It is very easy to ridicule the efforts of those who by patient work are trying to effect some good purpose. Mr. Stahl might just as well ridicule us for spending from two to four hours every pleasant day in our wheat fields while engaged in the tedious work of crossing wheats. As the result of the season's work we had barely a thimbleful of seeds to show. But from this little quantity of seed Mr. Stahl may some day be glad to sow a part of the product. That it would be absurd for every farmer to select his seed-wheat by shelling out by hand the middle kernels of the best heads, or even as he would select his seed-corn, is very evident, and this was stated in the article criticized.....

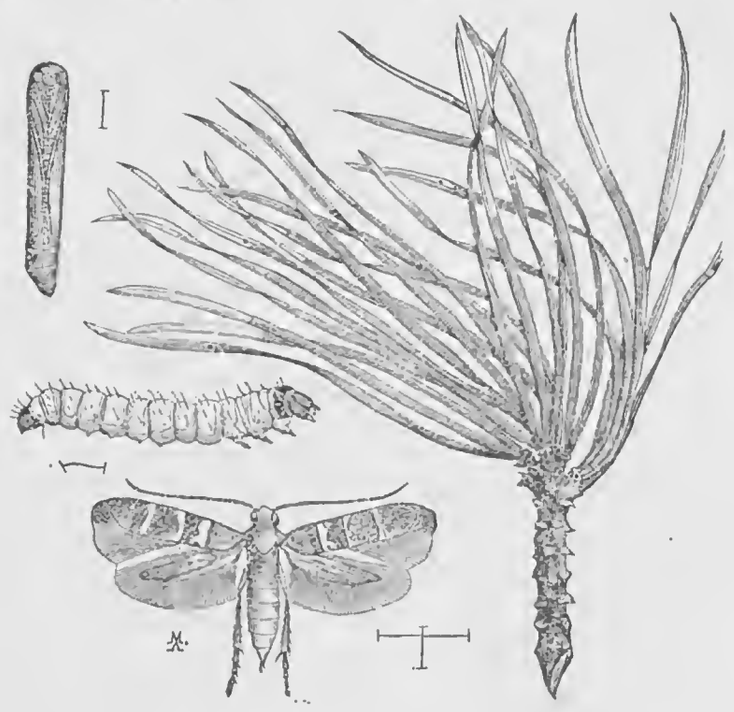
THE Normantown Wonder, Dumeller or Wellington Apple, as it is severally known in England, is said to be of large size, highly prolific and possessed of first-rate keeping qualities. It meets with a ready sale in the London markets. We should be glad to know if this apple has been tried in this country and with what results.....

TWO new double Tropæolums are announced in France—one bearing scarlet, the other yellow flowers as large as those of double portulaca and quite resembling them. They may be looked for in florists' Spring catalogues, we presume.....

WE learn that Professor Blount enters as a competitor for our wheat premiums. We hope that every RURAL subscriber that owns a square rod of land will strive either for the wheat or corn premiums. It may be well thus early to state that the Fultzo-Clawson wheat is to be planted upon a plot 33 feet square (one fortieth of an acre) *one grain every 12 inches apart either way*. As for the Surprise wheat, each competitor will treat it as he chooses. There is but one premium offered in connection with this—twenty-five dollars for the best five heads. Only a few grains will be sent of the Surprise, as has already been stated, since we have but a small quantity of seed.....

PROFESSOR BLOUNT writes us: "I had a plenty of Black-bearded Centennial with *white* beard. As you say, wheat of the same kind will sometimes vary in chaff, beards and even color of kernels. This arises from climatic changes such as showers succeeded by hot suns as well as from soils."....

A FRIEND, who has made wheat a study for years, writes us as follows:—"I have read with interest your correspondence with Messrs. Haines & Co. in regard to the identity of the Black-bearded Centennial and the Golden Grains wheats. I have all the while believed you to be right. What you say about the flour-making quality of either of these wheats is apparent to the most careless observer. They are very soft and will not make as good flour as the Clawson. It appears to me that if you wish to trace the history of the Black-bearded Centennial you might get on the track by writing to the Department of Agriculture and ascertaining where they obtained the supply which they distributed several years ago. I am not certain, but I think it is stated in the Virginia Commissioner's report that this wheat was imported by the Department from Australia. It was among the Australian exhibits at the Centennial. If Messrs. Haines got the Golden Grains from the Willamette Valley, Oregon, there is nothing more likely than that it was also brought there from Australia.".....



THE PINE-LEAF MINER.—FIG. 523.

What Others Say.

EFFECTS OF FREQUENT CULTIVATION.—From the Report of the Illinois Industrial University for 1880, we select several very interesting parts: In an experiment to compare common with frequent cultivation of corn, a plat was planted June 14. One-half, in alternate strips of four rows, was cultivated six times during the month of July; the other half three times. The result was as follows:

				Pounds.
Four rows, cultivated	3	times		229 60
" "	6	"		292 60
" "	3	"		259 70
" "	6	"		229 70
" "	3	"		331 80
" "	6	"		329 70
" "	3	"		315 00
" "	6	"		299 60
" "	3	"		276 50
" "	6	"		269 50
" "	3	"		261 80
" "	6	"		295 80
" "	3	"		276 50
" "	6	"		284 90
" "	3	"		291 90
" "	6	"	only three rows	211 40
Averages of rows cultivated	6	times		303 97
" " "	3	"		243 89

Frequent cultivation gave an increase in yield of something over eight per cent. In another experiment of the same nature the increase was a little over five per cent.

SHRINKAGE AND PER CENT. OF COB.—As shown in the report of Prof. Scovell, Agricultural Chemist, the average shrinkage of ten ears of each of six varieties of yellow dent corn, gathered October 7, 1879—when all was fairly matured except one variety—and kept in a warm room until February 28, 1880, was 12.1, 16.8, 17.4, 22.5, 22.8 and 33 per cent. The percentage of cob at same date, taking varieties in same order, was 12.3, 16, 12.6, 15, 11 and 14.4—the average being 13.7 per cent. In another trial in 1880, of corn well dried in a warm room, the average percentage of cob in specimen ears of fourteen dent varieties was a little over 14. The varieties were from 10 to a little over 20 per cent. The weight of the cob varied from one ounce to two-and-one-fourth ounces.

CONVEYING WATER BY A SIPHON.—Water being required for pasture lots on the farm of the Industrial University, reports Mr. E. L. Lawrence, the head farmer, the attempt was made to supply it from wells, located high enough above low portions of the lots to permit the use of a long siphon, by which the water should run *up* and out of the well in a steady stream to the point required. Aside from the collection of air in the tubing, there is no probability of this getting out of order as is the case with the wind-mill: there is no machinery to wear out and there is no cessation of action. The first expense, of course, depends upon the depth of the well, and the distance the water is to be carried. In many cases, however, this is much less than the original cost of the wind-mill. The two trials made have proved eminently successful.

WITH the view of obtaining water by means of the siphon, for stock supply, the following experiments were made: First, in July, 1878, under the following conditions: Well nine feet deep to bottom, depth of water from two to 4½ feet, size of pipe used, one-half inch. Distance from well to tank, 700 feet. Pipe laid 2½ feet below the surface. Highest point where pipe is laid, above bottom of well, nine feet. An excavation of 2½ feet was made for place to set the tank, and one side planked over, with tile laid underneath connecting with a previously laid drain, 100 feet further down the slope, with a pipe connecting with the pipe to carry off the overflow from the tank.

The cost of this is given as follows:

Tank holding 12 barrels	$ 9 75
700 feet ¾ inch gas pipe @ 3c	21 00
Digging and filling 700 feet of ditch	9 00
Excavating for tank, fitting pipe, etc.	15 00
Total	$54 75

To remove the air from the pipe a common cistern pump, costing $3 was used. The result of this may be briefly stated. Whenever there is four feet or over of water in the well, the flow is uninterrupted and continuous; thus from October, 1879, to May, 1880, it never stopped, and never froze during the Winter. When the water in the well falls below four feet, it is necessary to use the pump to remove air from the pipe that accumulates at the summit. With three feet in the well, the pump must be used for about ten minutes, about once a week, and oftener if the water falls below that point.

The second trial was made about three-fourths of a mile from the first, in October, 1879. In this case the conditions are as follows: Length of pipe, 1,000 feet. Fall from surface of water in well to bottom of tank, five feet. Size of pipe used, one inch. Here, instead of going over the hill, as in the first instance, we went around it and for several rods dug down from five to six feet to lay the pipe, so that no point is higher than where it leaves the well. This will supply water at all times for 100 head of cattle and cost $119. It is thought worth $500.

SUGAR FROM SORGHUM.—1. From careful chemical analyses of and practical experiments with Sorghum cane grown on the University Farm, the following general conclusions were reached. It appears that crystallized sugar can be obtained from sorghum, of as good a quality as that of the ordinary brown sugars found in market. A portion of this brown sugar was re-dissolved and the solution passed through a mixture of charcoal and clay. On evaporation it yielded a light brown sugar, which dried very rapidly in the air, and showed no trace of sorghum taste or smell. A portion of this product was placed in a percolator and the adhering molasses washed out. The result was a perfectly white sugar.

2. To insure the production and best yield of crystallizable sugar, the juice must be treated with lime before heating. If, after skimming, the excess of lime be neutralized by aluminum sulphate, sulphurous acid, or even sulphuric acid, the sirup obtained will be of a light color; otherwise the excess of lime will cause the sirup to be dark.

3. From the proximate analysis of the cane, it appears that one acre of sorghum produces 2,559 pounds of cane sugar. Of this amount we obtained 710 pounds in the form of good brown sugar, and 265 pounds were left in the 737 pounds of molasses drained from the sugar. Hence, sixty-two per cent. of the total amount of sugar was lost during the process of manufacture. This shows that the method of manufacture in general use is very imperfect.

4. The 710 pounds of sugar, at eight cents a pound, would bring $56.80. The molasses is worth, at 25 cents per gallon, $17.75; or the products of an acre of sorghum would bring $75.55. There is no question that, with proper care and apparatus, the above yield can be readily doubled.

5. Nearly two-thirds of the sugar, as has been seen, is left in the *begasse*. This could, in great part, be recovered by percolation with water, as is done sometimes in the manufacture of beet-root sugar.

IN feeding rutabagas with grain in proper proportion as related in the Husbandman, Pres. McCann of the Elmira Farmers' Club would count them worth 28 cents when corn is a dollar a bushel—that is to say, he considers four bushels of rutabagas worth a little more in cattle feeding than a bushel of corn, when both are fed together.

G. W. HOFFMAN thinks that roots used in feeding cattle are worth for that purpose not more than 10 cents as compared with grain at market rates. The main advantage in the use of roots is in their favorable action in the improvement of condition, not as flesh-making food so much as an appetizer and regulator. With corn at a dollar he would prefer to use it rather than pay 25 cents for rutabagas. His estimate of relative values would be not far from five of rutabagas or beets or carrots to one of corn. Potatoes rate higher. They are worth in his feeding nearly half as much as corn—say three bushels, perhaps two-and-a-half, of potatoes to one of corn. Common flat turnips he ranks about ten to one. All these estimates it must be understood are for mixed feeding.

J. S. VAN DUZER notes that a late estimate of the value of wheat bran for cattle feeding is lower than for hay. It seems to him at variance with the facts, but may be correct.

G. W. Hoffman considers it is about right. The thin wheat bran, that we buy now-a-days is about as poor as bran can be. Ton for ton he would prefer good hay. He has fed a great deal of wheat bran and has come to regard it as low in the scale of values.

J. S. Van Duzer, if he had to buy bran and hay at the same price per ton, would take more of the bran. He has fed a great deal of it, and can not accept the low estimate of value.

PERSISTENCY OF HUNGARIAN GRASS.—A writer in our esteemed contemporary the Kansas Farmer, makes this statement as to Hungarian Grass. Ten years ago he sowed 30 acres of new sod with Hungarian seed. The next two years he raised corn on the same land, and the Hungarian grew so thickly that he was forced to use the hoe.

The following year he sowed Timothy seed, hoping to kill the Hungarian. Instead of Timothy, the Hungarian grew about two feet tall, fine and even, turning out over two tons per acre. In the Fall he sowed again to Timothy, but for lack of rain the seed did not start, and the following season he mowed another crop of Hungarian, thicker, but not so tall as the last. The following season he sowed Timothy again, and mowed another fair crop of Hungarian. He plowed the field and planted to corn, and each year the Hungarian grows thriftily among the corn, some of the heads as full and fine as the original crop. It is useless he says to sow Timothy in the Spring after Hungarian. Timothy sowed in September, if we have rain to start it, will kill out Hungarian the following season. Hungarian seed shells in handling more than other seeds, but will not sprout the same season as wheat and oats, but will wait in the ground years for its chance to grow.

A MEMBER of the Western New York Farmers' Club, as reported in the American Rural Home, said he had asked shippers if they supposed purchasers, if they knew that the fruit (apples for instance) were not uniformly as good as they were on top, would pay more for them if they were faced than if they were put in just as they would average. They said they thought they would, and that they had become so accustomed to it that they expected to find them thus faced. . . . In one instance where buyers were packing potatoes, they told him that they faced both ends of the sacks so that they would appear well on top in the sacks, and when turned into the barrels the bottom part of selected potatoes would present a fine appearance on the top of the barrel.

THE Scientific American says that a resident of London, England, claims that that city spends over $25,000,000 a year for oysters, and that more than twice the number of these bivalves would be used if they could be obtained at as reasonable prices as in America. The genuine Whitestable oyster fetches about 75 cents or 80 cents a dozen. Oyster culture in England is yet in its infancy. Large numbers of oysters are now carried to England from this country. The most popular size for eating is a shell about as large as a dollar. They are packed in barrels very closely and kept right side up during the voyage. Quite a trade is now springing up in carrying "seed" oysters to Europe . . . . . The seaboards of Georgia, South Carolina, and Texas abound in oysters. In some places they have grown up into reefs extending for twenty miles along the coast. Much of this oyster wealth may yet become available for Northern markets . . . . . Science has demonstrated that oysters can be so managed that their spawning seasons can be regulated, and thus good oysters be had and eaten every week in the year. This is arranged in the Connecticut waters by planting them in different depths of water. This secures variety in temperature. The greater the heat the earlier the oyster will spawn. Therefore by moving them into shallow water in a sheltered place where the sun will warm the water easily the spawning season will be over in early summer. Those in the deeper and colder water will, of course, feel the heat later, and therefore spawn later. Thus one portion of the oyster supply can be always ready for use.

OUR friend, Governor Furnas, according to the Pacific Rural Press, had heard of the attractions of California, but he thinks the half had not been told him. In fact, the Governor remarked that if his interests in his own State were not so large, and his associations and relations other than what they are, he would pull up stakes and emigrate to California with a view to engaging in horticulture there. . . . . Dried bananas from Jamaica.—An attempt is being made, says the Gardeners' Chronicle (London), to find a mar for this product, and there is no doubt that they will form an acceptable addition to the dessert-table, as they have the sweetness of the dried fig without the inconvenience of the numerous seed-like fruits. There is no doubt also that they have a considerable nutritive value. . . . . IT is physically demonstrable, says Professor Orton, in Secretary Chamberlain's Ohio Agricultural Report, that in multitudes of instances the cess-pools feed the wells. The additions to the cess-pools of one day are pumped from the well the next. . . . . God forbid us any longer to misinterpret His providence; and we, alas, must bear our own burdens, and, for a multitude of our sicknesses, at least, must accept the humiliating explanations which are furnished by our ignorance, self-indulgence and laziness. . . . . Progress (Phila.) thinks that, after all, vanity in the abstract is but a laudable desire to appear well and to feel convinced in your own opinion that you are accomplishing that desire. You are happy in the estimation of yourself, and the world is by no means a loser in the profit it receives from this almost universal ambition to put the best foot foremost. Thinking well of one's-self often brings with it the strongest craving for the good opinion of others. . . . . Morally and physically we must suffer to be beautiful. Savage and civilized alike endure tortures to gratify the æsthetic instinct. Men, women and children all suffer for the sake of beauty. . . . . It is a glorious sign for the South, says the Farmer and Mechanic of Raleigh, N. C., when field laborers can earn from fifty to eighty cents per day, and when artisans of all trades can find employment from dawn till dusk, and all night in some localities. Speed the plow! Rattle the loom! Ring the trowel! Whistle the factory engine! Stick the types! Swing the school-house bell! . . . . . The Husbandman thinks that in the common-sense view it is absurd to issue a patent on wire fence. It is no more an invention than a thorn bush is. Machines for making barbs and attaching them, may properly be patented, but the product ought to be as free as the material of which it is constructed. . . . . Justice, it is to be feared, is blind in more senses than one, remarks the London Live Stock Journal. A poor wretch who goaded by the pinchings of poverty, steals a bagful of turnips, is sent off to the county gaol for a month; while the scoundrel who does his best to poison his neighbors by selling unwholesome meat escapes with a fine, which is easily paid out of his ill-gotten gains.

Everywhere.

RURAL SPECIAL REPORTS.

Arkansas.

ALTUS, Franklin Co., Nov. 3.—What opinion many readers of the RURAL may have of Arkansaw (now called such in order to obey the dictum of a late Legislature of the State) I do not know, but I presume that since a more general diffusion of knowledge abroad through the columns of the 100 newspapers published here, the world has a better opinion of our resources, as well as of our intellectual and moral character. We are now quiet and peaceable in all our borders, with a low degree of prosperity as compared with former years. The past season our soil labored to bring forth its usual quota of cereals and fruits, and succeeded admirably under the burning sun and cloudless heavens of our unparalleled Summer for drought and heat. Railroad constructing is on the "boom," and some of the magnates are competing zealously in efforts to cross our State in several places. Soon we expect to be able to tell of a population equal to our unbounded resources. We are able to sustain a million more of people than we have from agricultural resources alone. Then the undeveloped mineral wealth is now attracting the attention of capitalists. Our mineral waters are everywhere abundant, and in medicinal properties will compete with half the world beside. I have spent 14 years traveling over the hills, mountains, valleys and bottom lands of Arkansas, and have become familiarly acquainted with every nook and corner of it, and I hesitate not to say that it compares well with any State in our great country and far excels many of the older settled States in its grand resources. GREGORY.

HOT SPRINGS, Garland Co., Nov. 3.—Is it not provoking to reflect that after enduring one of the severest droughts ever known, we are now likely to have no fruit next year? We thought that to lose our crops the present season was all we could endure, but the prospect of the future fruit crop is gloomy enough. Pears, early apples, plums, peaches and other fruits are, or soon will be, in full bloom, The shrubbery is also blooming; we are having the finest of Spring weather and unless old Boreas makes haste this way we shall have no fruit left. It is to be hoped old Saturn, Jupiter and all those other big fellows will get back into their places again and remain there during this generation. Cotton is about all picked; everybody sowed turnips. We have some rye and wheat. Fall pasture is coming on finely. Stock thin and very cheap, $6 to $10 per head for cattle. After all, we have something to be thankful for—this delightful climate and these hot, healing waters. T. J. B.

California.

DEER VALLEY, Park Co., Nov. 1. — We dug some large holes in the garden and procured some very rich soil, cut the White Elephant Potato to single eyes and planted them one in a hill. They came up nicely, but were cut down twice by frost early in June; still we have several pounds of nice tubers, but no very large ones. Of the asparagus seeds a little over one-half germinated and did nicely. It was very dry here in May and June, and we had to water the bed every day. The Washington Oats we sowed in the garden in drills two feet apart, giving each plant ample room. They did well, but not better than other varieties we have tried. The ground has been manured somewhat every year. The longest panicles measured 15½ inches. We put a few of the flower seeds in boxes; only one plant survived. We will try starting the rest in a hot-bed in the Spring. As for the Rural Branching Sorghum, we waited for frosts to be over until too late; we will have to try the hot-bed. C. T.

Canada.

CORNWALL, Ont., Oct. 27.—The RURAL comes to hand as regular as a clock and is more interesting and instructive than any agricultural paper I have ever seen. Many a time, when thinking about economizing, my thoughts have turned to the RURAL, but not to dwell there long, for I would soon conclude that it is the best investment I could make. The seeds alone are worth the money, and I shall be the last to grumble if you raise the price to $2.50. I shall certainly give up my local paper before I give up the RURAL. The harvest has been very good in this section, with the exception of corn, which has been a failure; but as this is not generally a corn-growing country, we do not suffer much. Hay is a good crop, but not extra in quality owing to heavy rains at harvest time. Oats and barley very good. Wheat very fair considering the dry weather. Potatoes and all roots very good. The early frost we had cut down everything we had left in the garden in the shape of turnips, celery, cabbage, etc. I had a beautiful crop of Beauty of Hebron raised from the seed the RURAL sent. I had bad luck with my White Elephants. I cut the potato to single eyes and only one came up; the others were killed by heavy rains in the Spring. From the one eye I raised 4½ pounds of potatoes, which I think ought to satisfy any one. The sorghum was a failure with me, but the other seeds were all excellent and a great acquisition. I am looking forward to the new Free Seed Distribution with some pleasure, for I know there will be something good about them. W.T.

Colorado.

TABLE ROCK, El Paso Co., Nov. 1.—My Rural Branching Sorghum came up very well; but this location is too high and the seasons too short to ever make it a success here. I cut my White Elephant to single eyes; all came up well; the vines grew quite rank and I harvested 11 pounds only. The season was very dry, or no doubt they would have done better. The Washington Oats came up well, and after removing the stalks containing rust as fast as it appeared—which was considerably—I got 10 pounds of clean oats of very fine quality. The asparagus did very well, considering the season; the seed nearly all grew. The grain crop in this locality was very light; most of it was cut for hay. Potatoes a fair crop and on some ranches good. No fruit is raised in this vicinity. J. E. K.

Illinois.

DOVER, Bureau Co., Nov. 1.—The asparagus seeds of both kinds came up very well. Rural Branching Sorghum did finely. Washington Oats came up well, but my hens found them, and took them before they were ripe. The White Elephant Potato I cut into 13 pieces and planted in 13 hills, yield 53 tubers weighing 13 pounds and 10 ounces of very good size. All the seeds did well for such an extremely hot, dry and buggy season. Now for the pinks: I planted the seeds from both packages in the house on April 14 in a box. They came up finely and I transplanted them into the ground about the middle of May; the 10th of June the first pink opened; it was double and very pretty. About the 25th of June I began to have plenty of blossoms and counted at one time 36 pinks, all of different shades and markings, but what seemed strange to me was that not one was pure white. When I transplanted into the ground the first time, I sowed the rest of the seeds, and they did equally well with the first. To-day I picked my last pink to put on a bridal cake. The carnations have not blossomed yet, but I have taken them into the house and they are looking fine. I have saved a goodly amount of seed and my pink roots out-of-doors have unopened buds now which a few warm days will perfect. I have enjoyed my bed of pinks very much indeed and shall take pains to keep those in the ground alive for Spring. C. A. T.

Kansas.

CAWKER CITY, Mitchell Co., Nov. 2.—I hope some of those who have succeeded in raising seed from Rural Branching Sorghum will let it be known if they have any to spare, as ours failed to seed. We are anxious to get enough to try again, as we consider it a valuable article for stock food. Ours grew finely, each hill having from 12 to 20 stalks. The other seeds did fairly, but none so well as the sorghum. The oats grew well, but we failed to get seed from them, too, as the native grasshoppers liked them so well that they, very selfishly, took the whole crop. The potato, on account of the drought, failed to give us much more than the seed. We only harvested three small tubers. The pinks, what I saved of them, were fine. In our part of the State crops are generally poor. The early-planted corn did very well, but that of late planting was, much of it, an entire failure on account of the drought. Potatoes, the same. They sell here for $1 to $1.25 per bushel. I think our State is destined to become a fine stock country, unless a few more dry seasons frighten us all away. E. S. W.

Maine.

BOLSTERS MILLS, Cumberland Co., Nov. 3.—The crops are all gathered. Corn was very good; the potato crop was also very good with some and light with others. The grain crop was fair with most of the farmers. The RURAL seeds did well From the single White Elephant I got 72 good-sized tubers. The Branching Sorghum didn't grow very well. R. S. P.

Michigan.

BRONSON, Branch Co., Nov. 2.—The White Elephant Potato was of the size of a common hen's egg; it had seven eyes; I cut it into seven pieces and planted them in seven hills all in a row 16 feet long, on the 8th of May. The vines made a wonderful display—very large and rank. I dug them on the 28th of August—weight of crop 28 pounds, mostly large and fine. The Rural Branching Sorghum I planted on the 20th of May, one seed to a hill. It made a very slow start, but by the middle of July it was five feet high, with from seven to twelve stalks to a hill. From July 25 to 31 I cut off half of the piece for a second growth; it is now green and growing, with from 20 to 34 stalks in the hill, six feet high, averaging 20 pounds from both growths to each hill!! My horses devour it with a relish. We had a long spell of dry weather in part of July and all of August; the sorghum remained green and growing when everything else suffered. I think the seed raised on the uncut half of the patch will grow. W. A.

MARSHALL, Calhoun Co., Nov. 2.—I had eleven hills of White Elephant Potatoes and nine came up and did well. Of the dianthus and picotees every seed germinated and the plants are splendid—155 different kinds: half blossomed. The Rural Branching Sorghum and asparagus did well. The Washington Oats did better than the White Russian Oats right alongside, but the drought put all the seeds back, so it was not a fair trial for any of them. J. R. T.

TERRY ST'N, Bay Co.—My White Elephant Potato weighing less than two onnces, was cut into 16 pieces by dividing some of the eyes. The pieces I rolled in plaster and planted one in a hill in dry sandy loam on May 10. Yield, 152 tubers, weighing 64 pounds. Largest one weighed 1⅛ pound. A frost on June 10, cut potatoes and all tender plants to the ground. Washington Oats grew well, but rusted badly. Rural Branching Sorghum made a fair growth but did not ripen seed. Asparagus did well, also the plants from the flower seeds. Success to the RURAL! E. M. P.

Ohio.

CAMDEN, Preble Co., Nov. 3.—We have had fine showers for the last month, which have revived our pastures and given our wheat a good start. Our early sown wheat has been badly injured by the fly and grub worms. My White Elephant did not do very well as it was so very dry. The Branching Sorghum stood the drought extremely well and ripened its seed finely. The asparagus made a good growth. We have had but little frost and late potatoes have not been much injured yet, and our Peachblows may make a moderately good crop. Early Rose are almost a complete failure. W. M,

GALLIPOLIS, Gallia Co., Nov. 2.—I have taken the RURAL 23 years and I cannot get along without it, as it is the best paper of its class that I can find and is growing better as it grows older. The weather was too dry and hot for the White Elephant, but I have one-half peck of small tubers. The Washington Oats rusted somewhat and smutted badly.

The Rural Branching Sorghum came up nicely; nearly every seed grew. It was planted May 23 and was up May 28. On August 1 it was six to eight feet high; by the 15th the lower blades began to dry up. I cut all but six or seven hills. I thought it was so dry it would not grow any more, but it grew about 18 inches before it rained—about the middle of September. The second growth is now five or six feet high; what I did not cut is about 10 feet, is headed out and some seed I think will grow. It is a success. The asparagus came up very well. The weather was too dry for the flower seeds. Wheat, one-fourth of a crop; hay, one-half to three-fourths; corn, one fourth to one-half. Late potatoes are growing yet; they wont average more than one-fourth of a crop. About the usual amount of wheat has been sown; it looks fine. W. H.

Pennsylvania.

BROOKLYN, Susquehanna Co., Oct. 24.—The RURAL seeds were all valuable here except the oats. I had 21 pounds of potatoes, large and very nice. Was much pleased with the sorghum; shall try it again if I can find seed. We all like the RURAL very much, and as long as I can make $2 a year you may count me a permanent member of the RURAL family. E. L. W.

MIDDLEBURG, Snyder Co., Nov. 5.—The RURAL was worth a whole crop of corn to me; let me explain: In many parts of Pennsylvania and other places corn is an almost entire failure this year. In the RURAL I saw the Hoosier corn drill advertised, and got one and planted half of 10 acres 16; and half 20 inches apart. What was 20 inches apart is very good, and that which was 16 is not quite so nice in the ears. On the whole 10 acres there are only a few nubbins, while five or six neighboring farmers have hardly any corn, and what they have is nubbins and not much of that. Now whom shall I thank for this? Why the RURAL NEW-YORKER, for if I had not read the RURAL I would never have got the corn drill. Nor is this the only instance. I also get the Agriculturist but the RURAL is of a more experimental nature, while the Agriculturist merely suggests how it might be done. Another instance, when a subscriber asks a question of the RURAL he is sure to get an answer: It pays any farmer to get the RURAL NEW-YORKER. G. S. S.

WALLSVILLE, Luzerne Co., Nov. 7.—I received two White Elephant potatoes, one in the forepart of Winter the other in the Spring: the two weighed eight ounces and contained 37 eyes. I planted them one eye in a hill on May 7, in good garden soil. All came up except four or five hills. I dug them Aug. 13, and got 23 pounds of from small to medium-sized tubers; not white but resembling the Beauty of Hebron in color. The bugs injured them very much, I think. The second crop of old bugs cut the leaves nearly all off before I was aware of it. The Rural Branching Sorghum I planted June 1. I planted Black Mexican sweet corn at the same time and close beside the Sorghum. Both came up well; but from the time they both came up until the corn was ripe, I do not think there was a time but what there was double the weight of sweet corn on the same amount of ground that there was of Rural Branching Sorghum. The corn made a good growth and eared well, while the Rural Branching Sorghum attained but four or five feet in hight, the drought affecting it more than it did the corn. I am fully persuaded that there has not been anything found as yet; nor is there likely to be soon that will equal corn for a fodder crop in this section, and to get the best results I would plant the larger kinds of sweet corn in drills far enough apart to cultivate and thin enough to permit the crop to ear somewhat. The Washington Oats I sowed but do not think they are any improvement over the common white oats of this section. The Ennobled Oats did well this year; but I do not like the color. I have a fine lot of nice asparagus plants for transplanting next Spring. The pinks did splendidly and were as near perfection as anything of the kind ever seen in these parts. Notwithstanding the drought, Winter grain, oats and hay were good crops. Corn and potatoes light. Fruit medium. The prices at our nearest market (Scranton), are about as follows: hay, $15 to $17; wheat, $1.40; corn, 75c.; oats, 50c. to 55c.; potatoes, 90c; apples per bbl., $1.50 to $2; butter, 28c. W. E. M.

Texas.

DENTON, Denton Co., Nov. 1.—We had a poor crop season here as in most other parts of our country. Thousands of acres of corn made absolutely nothing; but there was an immense lot of old corn left over, and a good oat crop for the small amount sowed, and now we are having an abundance of rain which is making the grass as good as or better than it was in the Spring, so, putting this and that together, we will make out to live if we don't die. This part of Texas is a beautiful prairie country and one of grand capabilities. The soil is splendid and from one to five feet deep, commonly two or three. We usually have two wet seasons in a year—one in the Spring and the other in the Fall; and with these exceptions it is what might be called a dry climate, and the drier the healthier. My corn averaged 15 bushels to the acre; wheat, 15 bushels; barley, 10 bushels; oats, 30 bushels, cotton $20 worth to the acre. Our greatest trouble just now is caused by the army worms, which are eating and killing our young oats, wheat and barley. As near as I can tell, and as far as my knowledge extends, they have killed about 19-20 of all in the State. Small grain, however, is chiefly sown only in the north middle part of the State, the center of the grain region being somewhat west of the Texas Central Railroad.. J. H. J.

Wisconsin.

CROSS PLAINS, Dane Co.—After reading of such large yields from the RURAL seeds, I am ashamed to say anything about mine, but still I don't think 13 pounds of tubers from two ounces of seed so very bad, all things considered. They are very nice-looking, five of the largest weighed from 10 to 17 ounces. The sorghum and asparagus did not germinate very well owing to a dry spell we were having at time of planting, but what did grow have done well. I left some hills of sorghum to see if it would seed and think some of it will grow. I can brag on the number of stalks to the one seed or hill if nothing else, for I counted from 22 to 42 from one seed, and after the second cutting it started for a third crop; but the frost arrested it. The Washington Oats promised finely but the wind and rain storms broke them down so very badly that I got only 2½ pounds of very light oats. I sowed part of the dianthus seed which came up well, the plants look very pretty and are of a good many different colors, both single and double—from white to almost black, spotted and fringed. I expect something grand from that bed of dianthus next Spring and Summer. E. A. T.

NEW CASSEL, Fond du Lac Co., Nov. 1.—It has been raining almost all of the time of late. Farmers are backward with their work; it is too wet to plow or to do anything else on the land. Corn that is in the shock yet is in bad condition, and the fodder is almost spoilt. Winter wheat is getting pretty large. Many think early sowed will get too large. Rye is looking fine and there is a good deal of it sowed here this Fall. Potatoes were a pretty good crop and command a good price—about 75c. per bushel; wheat, $1,25; barley, $1; corn, 75c.; rye, $1; oats, 30c.; clover seed, $5.75; Timothy, $3; butter, 20@30c.; hay, $8 per ton. J. O. N.

Washington Territory.

WAITSBURG, Walla Walla Co., Oct., 29.—The yard is green with young weeds and grass which have just sprouted. Wheat is just beginning to come up. The tenth of this month, the people awoke in the morning to find fruit trees, which were full of foliage and ripe fruit, and flower-gardens which were radiant with bloom, among them, the tender petunia, all enveloped in a mantle of snow, which was at least an inch in depth. It made a pretty picture, but caused many exclamations of surprise, for we never before saw snow so early in the season, in this country; but it was not very cold, and I guess the injury done to ungathered fruit will not be very great. Tomatoes are still in the market for one cent per pound. The very finest of apples can be bought for one cent per pound. Wheat is still 60 cents per bushel; barley, 87½ per hundred pounds. Corn is quite high so little is raised. Our nights are too cool for the successful growth of it. We have to pay five cents per pound for sweet potatoes; but they are very fine large ones. There are many immigrants coming in now. Many come in late in the Fall, and often have to camp out half the Winter because houses are all occupied. They ought to come earlier in the season. M. A. R.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

FATTENING RATION FOR CATTLE.

A. L. C., Catonsville, Md., says, "Can the RURAL help me any with a feeding ration for fattening cattle. I propose feeding 42 head in box stalls. I have any quantity of corn-fodder, about 30 tons of clover hay and plenty of corn; also a mill for grinding and a power cutter. Bran is worth $25 per ton; new-process oil meal, $28. I cannot feed mixed feed wet up, without great labor."

ANS.—Our correspondent is well situated for fattening his cattle in luxurious comfort. And if he wishes to do it with the greatest economy of food let him run his corn-fodder and clover through his cutter together, cutting as short as he can; or, say, one-half inch long. This may be cut in the proportion of eight of clover to twelve of corn fodder. These should both be fed into the cutter together. Had he told us the weight of his cattle, the amount and proportion of the ration could better be determined. But we will suppose them to weigh an average of 1,000 pounds when put up, and that he proposes to feed them five months or 150 days. He says he has plenty of corn, but he does not say what corn is worth per bushel, yet it can hardly be worth less in Baltimore than 75 cents, or $1.34 per 100 pounds, and this will make its cost after grinding as much as new-process oil meal, $28 per ton. On this basis we will try to give him a ration which will be likely to yield the best result from a given cost of food. It requires a certain proportion of the different elements of food to make the best ration for fattening or growing steers. Let us suppose this ration to be, for his 1,000-pound steers, eight pounds of clover hay, 12 pounds of corn fodder, 10 pounds of corn meal and four pounds of new-process linseed meal per head per day. This is supposed to be the average ration throughout the 150 days' feeding, starting with a little less. And to make this better understood, let us see of what the dry digestible matter of this ration consists. It will be understood better in the following formula, giving the amount in pounds and hundredths of pounds in each part of the ration.

Rations.	Digestible nutrients. Albuminoids	Carbo-hydrates	Fat	Total nutrients.
	lbs.	lbs.	lbs.	lbs.
8 lbs. clover hay	.56	3.04	.10	3.70
12 " corn fodder	.13	4.44	.04	4.61
10 " corn meal	.84	6.06	.48	7.38
4 " linseed meal	1.11	1.35	.08	2.54
31 "	2.64	14.89	.70	18.23

A study of this ration may be instructive. It will be seen the eight pounds of clover have more than four times as much albuminoids, or muscle-forming matter, as 12 pounds of corn fodder, and that four pounds of linseed meal have 30 per cent. more of this element than 10 pounds of corn meal; but in carbo-hydrates or starch, sugar, fat, etc., the corn meal is the richest. This ration has about the proportions found to be best by the Germans in practical feeding. The writer of this has also used a ration very similar, with the best result. Our friend should grind his corn and mix it with the linseed meal in the above proportion, and feed the mixture with the cut clover and corn fodder. Place three pecks of the mixed cut fodder in the manger of each animal and then put on this about five pounds of the mixed meal dry. In eating the meal the cattle will also eat the cut fodder, and all will be raised and remasticated together. The meal will thus be all digested. This feed will be given three times per day. If the cattle are thrifty at the start they should gain 400 pounds per head and the gain in price per pound live weight should be at least two cents per pound; and if the sale price is six cents, the gain will be $44 per head ($24 on the 400 pounds gain and $20 on carcass). This would pay for the grain food and leave about $16 for clover and corn fodder, and the manure will well repay the labor. Its value is greatly increased by the use of the linseed meal.

SALTING PORK, ETC.

G. W. B., Klickitat Landing, W. T., asks, 1, will barrels that have been used for packing butter in, or barrels that have contained sirup or molasses, answer for pork barrels; 2, about how many pounds of salt are necessary in salting 100 pounds of pork; 3, should anything else besides salt be used, when putting down pork in the barrel, to make it wholesome and good; 4, is it necessary to make a brine to pour over the pork, or will the juice of the meat form its own brine; 5, how long should the meat remain in the brine before taking out to cure; 6, how should the meat be cured after it is taken out of the brine; 7, will the manner of curing pork be successful if applied to beef.

ANS.—1. It would be safer to use new barrels for packing pork. Barrels which have contained sirup or molasses are good for hams and shoulders. Barrels which have contained butter would be very likely to be tainted, and this would injure the pork. 2. It is best to make a brine for packing pork strong enough to float a potato. This is the common rule. The bottom of the barrel should be covered with salt whenever pork is packed. 3, 4, 5, 6. Nothing should be put into a barrel with pork except salt. It may be packed without making a brine by putting a quantity of salt in the bottom and between each layer of meat and also on top, to the extent of 15 pounds to the hundred, and then pouring in sufficient well water to cover the whole contents. The meat should always be submerged in the brine or it will rust and spoil. It will keep only a few days if taken out of the brine unless it is smoked. Pork will only absorb a certain amount of salt, but the brine must be as strong as stated in order to withstand the effects of temperature and keep sweet. Less salt will answer if the meat is not to be kept a long time, and when it is there should be salt enough so that it cannot possibly be all dissolved. Eight pounds of salt to 100 pounds of meat are ample for hams and bacon, to which two quarts of molasses or five pounds of sugar and two ounces of saltpeter may be added. When prepared in this manner the meat need not be left in the brine longer than six weeks before being smoked. It may be cured dry, *i. e.*, the salt, saltpeter, and sugar or molasses may be mixed together and rubbed on the fleshy side of the meat and the meat piled together until the mixture is all absorbed. It should then be smoked. When designed for immediate use, six pounds of salt to 100 pounds of meat are sufficient. 7. For beef a brine should be made which will float a potato, and two ounces of saltpeter be added for every 100 pounds of meat. If the beef is first sprinkled with the saltpeter and left a day or two before it is placed in the brine, it will have a redder appearance and will not absorb so much of the salt.

COTTON SEED AS AN ONION FERTILIZER.

B. W. H., Lawrence, Texas, asks whether cotton seed is a complete fertilizer for onions to be raised on sandy soil—the onions to be put in before the middle of November.

ANS.—We have never applied cotton seed as a fertilizer especially for onions, though we have seen it used in a general way for vegetables with satisfactory results, and have found it beneficial to everything, except during such dry years as this, when it is likely to do more harm than good, burning and prematurely ripening the crop. Much the better way would have been to compost it with stable manure in about equal proportions; but as the case stands, we would apply it broadcast at the rate of 100 bushels per acre; plow it under, giving a liberal dressing of wood ashes, 40 to 50 bushels per acre, after the onions are up. Should the weather be favorable to the germination of cotton seed immediately after applying, but little benefit will be derived from its use. Good results would follow if, as the weather becomes colder, a slight furrow was opened close along on each side of the rows in which the cotton seed has been placed and covered by turning the soil back again.

Miscellaneous.

S. F. B., Buckeye Center, Ill., asks, 1, whether the RURAL pinks will winter out-of-doors; 2, will tuberoses have to be planted in the house, and when will they bloom.

ANS.—1. Yes. 2. To have flowers in August or September the bulbs should be potted and put in a hot-bed in March, where they should remain until they grow to a hight of three or four inches. In June the plants may be turned out carefully into the open ground. For flowers in October the bulbs should be planted in pots in May, carefully tended through the Summer and taken into the house before frost appears.

M. B. P., Henderson, N. C., sends a specimen of "Rag Gourd" and asks what is its botanical name.

ANS.—It is Luffa or Cucumis acutangulus. The fruit is sometimes eaten when young, the same as vegetable marrows so esteemed in England—but when ripe it becomes strongly purgative. When dried and reduced to its fibrous parts, it serves as a sponge or dish cloth and it is sold in various European countries as Egyptian Sponge. We have tried to raise it at the Rural Grounds with poor success. The season is too short.

G. F. R., Napoleon, Ohio, asks which is the better sort of corn — Chester County Mammoth or the RURAL Dent, and where can he get half a bushel of each.

ANS.—We much prefer the RURAL Dent from *this* season's trial. It does not shrivel so much. Leading Ohio seedsmen sell Chester County Mammoth. RURAL Dent is not yet for sale.

C. A. T., Dover, Ill., asks whether we shall have seed of the Rural Branching Sorghum for sale next Spring.

ANS.—We sell absolutely nothing but the RURAL NEW-YORKER. All seeds pass out of the RURAL's hands after our distributions. Seedsmen will sell the Rural Branching Sorghum, no doubt.

THE
RURAL NEW-YORKER,
A National Journal for Country and Suburban Homes,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, NOV. 19, 1881.

SEVEN YEARLY SUBSCRIPTIONS WITH $14 ENTITLE THE SENDER TO THE RURAL NEW-YORKER FOR ONE YEAR FREE.

THE MICHIGAN SUFFERERS.—The total amount of money contributed to the Relief Fund is about $500,000. In St. Clair, Sanilac and Huron Counties, there are 2,200 families who should have at least $100 each to carry them over the Winter. The Saginaw and Tuscola districts are not included in the above. Some objections to contributing to the fund are made on the grounds that Michigan is a rich and prosperous State, and should take care of herself, but until the legislature assembles no legal appropriations can be made by the State, and until it can do so, her sister States must aid her. The response has been prompt and the contributions large, but more money is needed, and needed now. Let the good work go on!

WHEAT AND SHEEP.—Notwithstanding all the disasters to these two products for several years past, English farmers contend that they pay best in the long run; and so far from giving them up, they are now determined to increase their production in the future as rapidly as possible consistent with other things. Their system of feeding off the crops of grass and roots with sheep—or the "golden foot," as they are called—and then sowing the land to wheat, is the easiest and one of the most scientific systems of farming practiced in any country. It is also one of the most profitable systems, superior, no doubt, if adopted in America, to that so common now of corn and swine. Aside from this, the two former are much more healthy food than the two latter, and make better bone and muscle, and grow up a finer and hardier race of men and women, especially if the wheat flour is not bolted to be made into bread, puddings and other dishes.

DERBYSHIRE HORSES.

IT SEEMS that a few of our breeders of the larger class of farm and cart horses have at last found out that the Derby horses are the best of their sort in England. It is the stallions bred in that county which have been used for some years past to cross on Clydesdale mares, which have so improved their progeny and given them the reputation they are now so freely enjoying. We are glad to note that some of our countrymen have lately been visiting the stables of the Hon. Edward Coke, of Longford, Derbyshire, who is considered the best breeder of Shire horses. He lately had a sale of 47 head, from colts up to aged horses, which made $15,970, an average of $340 each, within a fraction. These are large prices, considering that there were seven foals, six two-year-olds and the same number of three-year-olds among the aged horses and mares. One of the latter fetched the astounding price of 310 guineas ($1,550). It is a misfortune that, when our horse breeders began to import those of a large class so freely some ten years ago, continuing to the present time, they had not taken the pains to find out these in Derbyshire. They would then more generally have got horses of superior muscular power, an extra quality of bone and the best of feet and legs; great spirit also, fine, quick action for their size, indomitable pluck and endurance. But, instead of this some, if indeed we may not say a considerable number, of other kinds of horses that have been imported are quite the reverse of all this.

THE APPLE CROP.

BESIDES being an "off" year for apples, the drought has very materially affected the apple crop. In this State it will not be over 25 per cent. of an average crop, the supply for New York markets being, it is said, the smallest in fifteen years. The largest and best shipments received here this season have been from the New England States and Canada, those from the latter place being at present the best in market. Apples shipped from the Northern and Western counties of this State are usually the favorites in this market, but this year they are so small and knotty as to be hardly marketable. The custom, which we have before alluded to in the RURAL, of dishonest packing of fruit, is doing much damage this season both here and in foreign markets; and, if persisted in, shippers and producers must take the results. Not only are the apples poorly packed, but the barrels are undersized, some lacking a peck of full measure. Such shipments cannot successfully compete with those where the fruit is carefully packed and full measure given, nor should they. Dishonesty can claim no reward. The shortage in the crop is apparent when we consider the comparative amount of exports of the last two weeks in October for this year, and the same time last year, approximately estimated. In 1880 the exports for the two weeks were 167,375 barrels, while for the same period this year they are only 20,462 barrels, a decrease of 146,913 barrels. The total exports of apples, green or ripe, last year were 1,121,754 bushels, of which about 167,000 barrels on 417,500 bushels were shipped during the last two weeks in October; that is, something over one-third of the total amount. Judging from the number of bushels shipped for the same period this year, the total export for 1881 will be not far from 158,000 bushels, or about 967,000 less than last year.

THE PURIFICATION OF TOWN SEWAGE.

THE Native Guano Company of Aylesbury, England, according to the Statist, has perfected a valuable method of purifying town sewage. Aylesbury has 8,000 inhabitants, and its average daily flow of sewage is 300,000 gallons. For dealing with this the Company gets $1,500 a year from the corporation to which it pays $500 a year for the use of the works, so that the town gets rid of its nuisance at a cost of about 12c. per capita per annum. The sewage is treated so as to induce precipitation. Near the beginning of the main sewer some puddled clay, charcoal and a small quantity of blood are passed into the sewage. A trifle further on a little sulphate of alumina trickles into it; thereafter, the separation of the solid and liquid components is automatic. From the point where the alumina solution falls into the sewer, a channel about two feet wide runs in a straight line for 45 yards, and when the sewage has arrived at the end, it is chemically acted upon and the solid portions begin to separate from the liquid. From the narrow channel the mixture flows into the first of three tanks in which the precipitation of the solid matter continues, the overflow passing gently to the second tank and thence to the third where there is but little discoloration and almost a total absence of organic matter in suspension. From the third tank the overflow runs into a channel in which it is exposed to the air, and eventually is conducted into a brook far cleaner than the brook itself.

During the whole process there is absolutely no smell, and the sludge precipitated in the tanks is not offensive. When the tanks are full this sludge is pumped into an elevated receptacle whence pipes convey it to screw presses which separate the water from the solid portion. After quitting the presses the cakes are dried and finally shipped in the form of inoffensive powder, packed in bags for transport. Referring to the relative value of Peruvian guano and native guano made in this way, it is said that by using two tons of the latter at £3 10s. per ton the results would be as great as from half a ton of the former at £14 per ton; in other words, the Peruvian guano is four times as efficacious and four times as dear, so that for the same money the same effects will be produced though four times as much of the home-made guano must be used.

A CHANGE NEEDED IN THE PATENT LAWS.

THE facility with which patents can be obtained in this country has no doubt contributed greatly to its manufacturing success by stimulating the inventive ingenuity of the people. Hence there are about 22,000 applications for patents every year, and about 12,000 patents granted. The total number of patents granted up to last January was 225,000. The vast majority of these were for insignificant things, and it is probable that out of the entire quarter of a million patented inventions not over 100 were of such value as to revolutionize the practice in any particular department or to form for us a subject of national pride. From so vast a multitude of patents so vast a multitude of abuses have arisen that the whole present patent system has fallen into disrepute, and a strong feeling exists either for a radical reform of it or its entire abolishment. This feeling is especially strong among the farmers of the country, who have been the chief victims of grievous oppression and sheer swindling in connection with the sale of patents or patented devices. Hence the Grange, the Farmers' Alliance and all other associations of agriculturists are vigorously agitating a reform of the system, dwelling especially on the injustice of the frequent exaction of "royalty" from the innocent users of patented articles. With one voice they are all demanding that the law shall be so changed that royalty can be collected only from the manufacturer and not from the users of patented devices. Their demand is so just and their harrassment has been so unbearable that the alteration must soon be made if they loudly and resolutely persist in clamoring for it.

In a recent essay Mr. Roland Cox has pointed out the probability of an important change in the law relating to re-issued patents, a change that may invalidate two-thirds of the re-issued patents now in force. Under the name of re-issues the existing statutes provide that when any patent is invalid or inoperative by reason of defective or insufficient specification through "inadvertence, accident or mistake," the invention intended to be secured in the first instance may be re-stated under such restrictions as are supposed to guard against fraud. These statutes, however, have been so liberally construed that re-issued patents have frequently been permitted to cover not only the invention first patented, but also anything else suggested by it, and not already formally protected. The Supreme Court has lately declared that the real object of a reissue of a patent is not to allow its enlargement, but merely to permit the correction of inadvertent mistakes and the restriction of claims improperly made, or made too broad. Moreover, Justice Field, sitting in Circuit Court, has lately held that there can be absolutely no re-issue where the original patent, on the original specifications, is valid and operative, and at least two of the other judges are known to hold a similar opinion. The inventor seldom gains by these re-issues; for generally before they are granted the patent has become the property of a corporation. Then, to use the words of Judge Bradley: "A reisssue of the patent is sought, with expanded claims sufficiently general and comprehensive to embrace a wide monopoly of structure and to shut up competing establishments. In this way the patent laws have been made the instruments of great injustice and oppression."

BREVITIES.

AN account of the great Chicago fat stock show has just come to hand too late for publication in this issue.

HAMAMELIS (Witch-Hazel) illustrated in another column is described by several authorities as bearing a "rich" yellow flower. The flower is yellow certainly—but the richness of the color does not appear.

A FURIOUS BULL that had commenced goring a couple of men was lately coaxed off by letting out some cows to him. The moment he saw these he ceased his attacks on the men, joined the cows, became placid, and was easily driven into his stable.

A BALKING OR JIBING HORSE it is said may be easily started by taking up his near fore foot with the left hand, as a blacksmith does for shoeing, then prick him gently behind the ribs with a spur in the right hand. The horse feeling powerless to move thus held, as soon as his foot is set down, starts at once and goes off without further trouble. He ought not to be struck then, but patted and spoken to gently and encouragingly.

A CORRESPONDENT of the English Agricultural Gazette says that had they expended one-fourth the money in improving utility horses which they have done on racers, they would not now be obliged to depend on foreign countries, as they are now doing, for any part of the number necessary for every-day uses. He speaks particularly of those with "short, stout muscular legs, clean and flat." This is a point which cannot be too often strongly urged upon American horse breeders.

FROM Washington we learn that Commissioner Loring has decided to discontinue work on that experimental tea farm, and has sent a clerk to South Carolina to distribute the plants among private parties who may wish to try home-raised tea. All the government property there is to be sold or removed and the problem of the practicability of profitable tea culture in this country is to be abandoned by the government, its solution being left to private enterprise. We are sorry.

A DRAFT from W. J. Taylor's Polled Angus herd in Scotland averaged for 11 cows £56, 19s. 8d.; three two-year-old heifers, £41, 6s.; six one-year-old heifers £26, 12s. 9d.; six heifer calves, £17, 11s. 9d.; one two-year-old bull, £40, 19s.; two bull calves, £28, 17s. 6d.; One handsome seven-year-old cow, Kate Duff, fetched 155 guineas ($775), and a fine three-year-old, 70 guineas ($350). As Polled cattle are now commanding considerable attention among us, we thought our readers might like to know what a good ordinary lot was worth per head in Scotland.

THE Board of the New York Agricultural Experiment Station met at Albany last Friday and effected a permanent organization by electing the following officers: Pres., Robert J. Swan, of Geneva; Sec'y, N. M. Curtis, Ogdensburg; Treas., Luther H. Tucker, Albany. Two committees were appointed: one, composed of J. W. Woodward, James McCann and N. M Curtis, to examine farms with a view to selecting the best location for the Station; and the other, consisting of Governor Cornell, W. A. Armstrong and N. M. Curtis, to secure a director for it.

MR. JOS. NIMMO, Jr., Chief of the Bureau of Statistics, states that the number of tons of freight carried on the 13 chief railroads increased from 45,557,002 tons during 1873 to 78,150,913 tons during 1880—an increase of about 71.5 per cent. The receipts from freight, however, increased only from $112,004,648 in '73 to $148,388,178 in '80—an increase of $31,383,530 or only about 28 per cent. The average rate per ton fell from $1.77 per cent per ton per mile in 1873 to 1.07 per cent per ton per mile in 1880—a decrease of 39.5. And with anything like business-like management and moderation in percentage on actual capital invested, there is ample room for a great additional reduction—not ten years hence, but at once. Mr. Nimmo advocates governmental supervision of railroads.

OUR agent at the Atlanta Fair writes us that the exposition as a show is a fine success; but the attendance is very light. The several States had appointed committees to confer with the railroads and so far had met with considerable success. All that is necessary is to get the people there but they will not pay three, four and five cents a mile for excursion tickets. The Southern roads are the ones that are holding out. In view of the great drawback to the success of the exhibition which persistence in high fares would inevitably produce, we are glad that according to a telegram of last Saturday, all the roads have now agreed to charge only at the rate of one cent a mile for excursion tickets to the exhibition. A continuance of the former high charges would not only have greatly lessened the success of this remarkably fine show; but it would also have deprived thousands of the valuable information obtainable by a visit to its accumulated treaures.

THE Ladies Association for the Encouragement of British Woolen Manufactures has lately been established in England by the Countess of Bective. Its object is to restore the fashions in wool and worsted which preferred the fine lustre worsted wools of England to everything else for dress fabrics. Of late years these have been largely superseded by the skillfully constructed soft worsted fabrics of France; but the new association, having secured a long list of titled patrons, is bringing a great deal of social pressure to bear to restore the old fashion for dresses and trimmings made of home-grown wool. The influence of such organizations, gotten up by fashionable idlers, really for the sake of passing time and creating a little pleasurable excitement, but ostensibly for charitable or patriotic objects, is seldom more than fleeting, and already the ardor of the new Association is damped by the refusal of the Princess of Wales to use her personal influence to further the movement.

THERE appears to be some prospect of obtaining earlier and more trustworthy crop reports than have hitherto been obtainable. Last Wednesday and Thursday several meetings of the inter-State Association of Boards of Agriculture were held at Chicago. J. W. Porter, president of the Iowa Board presided, and W. I. Chamberlain, secretary, of the Ohio Board, was secretary. Delegates were present from Michigan, Ohio, Indiana, Illinois, Iowa, Nebraska, and Kansas, and the Department of Agriculture was represented by its former Statistician, J. R. Dodge. The main topic of discussion was the status of the State and national crop reports, and the best means of obtaining uniformity and superior accuracy. A plan of co-operation with the National Department was agreed upon, which will be presented to the Commissioner of Agriculture who is urgently requested to obtain and publish frequent reports on the condition of growing European crops with reference to the probable demand for our surplus grain and other agricultural products. A permanent organization was effected.

IT looks very much as if the recent British land legislation for Ireland was the commencement of a new era in land tenure in the United Kingdom. The reductions already made in the rents by the Land Court have averaged somewhat over 25 per cent. of the old rates, and this although the cases brought before it at the outset were, by the advice of the Land League, only those in which what was thought moderate rents were charged. The reductions must be much greater in cases where "rack rents" were exacted. Already, however, Irish landlords are demanding from the Government compensation for the diminution of their incomes caused by its action. English and Scotch farmers are now insisting on the speedy passage of land bills as favorable to them as that now under trial is to their Irish compeers. English landlords are reducing rents on an average about 25 per cent., in hopes of deferring such a measure; but the tenants claim the reduction as a matter of right, not of generosity, and, moreover, they claim the right to leases, payment for improvements and the other advantages conceded by the Land Act. The more energetically they agitate for such legislation, the sooner will it be granted. If it is delayed, the fault will be entirely their own; and now that even the weather favors their demands, they should insist upon them, lest fairer weather should lessen their force.

Miscellaneous.

FARGO, DAKOTA TERRITORY.

Its Rapid Growth, Extensive Commerce and Present Necessities.

MESSRS. HOLMES AND SWEETLAND.

[Special Correspondents of the RURAL NEW-YORKER.]

THE almost magical development of the great Northwest is nowhere more apparent than in the many cities which have risen upon the plains and in the fertile valleys almost like Aladdin's mystical palace, in a single night.

Not one of these shows more marked progress than the city of Fargo, D. T., situated upon the Red River of the North, where it is crossed by those great railways, the Northern Pacific and the St. Paul, Minneapolis and Manitoba, of which we gave a brief sketch in our last. Our first impressions of Fargo in regard to its life and commercial interests were rendered favorable by the fact that the business streets resembled a human beehive, while our application for rooms at the principal hotel was met by a discouraging nod and the information, "We are quite full; don't know whether we can accommodate you or not." Inquiry shows 35,000 registered arrivals at the three leading houses during the past year. Fargo's 4,000 to 5,000 population worship in six churches—Episcopal, Methodist-Episcopal, Presbyterian, Baptist, German and Norwegian Lutheran, and Catholic—buildings valued, entire, at $50,000. Her rising generation are educated by competent teachers in graded schools of six departments. The two buildings (one brick) now used for that purpose, are valued at $20,000. A handsome, new, two-story brick to cost 35,000, is now being built to supply the demand for additional school facilities. Fargo is justly proud of her efficient press. The Argus, published mornings (Sunday included), also has a weekly edition. We were surprised to find the library of the Argus exceptionally complete, containing every public document since 1832. The Fargo Republican, an evening paper, also publishes an excellent weekly. The Posten is a weekly Scandinavian paper. The city has three amusement halls, but sadly needs an opera-house, and a good one. Bright oases of green in shape of Island Park, City Park, (given to the city by the Northern Pacific), and Harwood Park, lend their charms to adornment and beauty. Fargo has the excellent Holly water system, built by Holly & Co., in 1880, capacity now 1,000,000 gallons per day, having been doubled since last year. It will throw four fine streams 100 feet high. The cost was $75,000. The fire department comprises a hook-and-ladder company, a good hose company with forty-four fire hydrants.

The value of permanent improvements for the year ending Oct. 1, is estimated to exceed $500,000, while the radius of trade, instead of contracting, is becoming more extended by the increase daily of the jobbing and wholesale business, and careful estimates made by five leading citizens, place the commerce of the year past (exclusive of wheat) at over $12,000,000. In wheat they received at this market, in 1880, 1,350,000 bushels. The price at the time of writing is $1.35 per bushel, which is remarkably high. The storage capacity of the three large elevators aggregates 300,000 bushels.

The banking capital of the city is $315,000 (four banks) and the aggregate exchange business is approximated at $20,000,000. It seems wonderful where a decade ago was nought but the trackless, untrod prairie. From the postmaster we learn that the money-order business for the last year foots up $140,000; the sale of stamps, $15,000, and that the office employs five assistants. It has recently moved into a new brick, devoted exclusively to its use. What with its telephone connections with Moorhead; its Chamber of Commerce, established in 1879, now numbering 65 members among the leading business men; its local insurance companies; its street railway organized with the contract let to build this Fall, Fargo is certainly putting on metropolitan airs, and for our part we know of no city which has earned a better right to do so.

Fargo owes much of its prosperity to its railroads; in fact, the Northern Pacific gave the town its first boom—as they say out here. Now it has, in addition to that, the St. Paul, Minneapolis and Manitoba, which road has a branch running north. The N. P. has a rolling mill and machine shops, mammoth stock-yards for Montana cattle, and numberless improvements, while it is from this point that trains will run on the Black Hills branch now graded 55 miles, and on the branch to the north, through Casselton. The Fargo and Southern is now being graded to connect with a system of Chicago roads, while a charter has been granted to the "Fargo and Northwestern." There are also river connections by the Red with Winnipeg, two lines operating during navigation.

The manufacturing interests of the city are yet in embryo, and, in our judgment, it has now reached that stage of progress where manufacturing is of essential and vital importance. Now, as a nucleus we note a large roller flouring mill of 125 barrels' capacity, a a blank-book manufactory, the Argus Lithographing Co., two planing mills, a hay press, and a 15,000-barrel brewery, all operating. Added interest in flax culture through the country will soon require an oil mill and tow mill. There is always room for flouring or oatmeal mills, while numberless other manufacturing enterprises would find within reasonable distance the crude material and a ready market. In our "Notes of Interest" we find the city indebtedness is only $30,000, $9,000 of which are bonded. * * * That it is considerered by many the best horse market in the Northwest, there being three exclusive sale stables accommodating 525 horses or mules. * * * That coal costs $10 to $11 per ton (hard), $6.00 (soft) in quantities, wood selling from $3 to $5 per cord. * * * That although this is considered a "no timber" country, the government survey gives Cass County (of which Fargo is county seat) 55,000 acres. * * * That the Fargo Agricultural Society of Dakota held its first fair Sept. 13 to 16, which proved successful. Their grounds comprise 80 acres with all necessary buildings and a magnificent race-course. They will hold annual territorial fairs. * * * That Fargo has six lumber yards. * * * That the University of Northern Dakota has purchased 20 acres of ground and expects to build soon. * * * That every business and professional man seems to take an individual and particular pride in Fargo, his home; and loses no opportunity of sounding its praises. If only a part of the laudations extended us were transcribed, it would fill a page, but we prefer to "stick to our text" and advise those who wish to know more to apply either in person or by proxy.

Societies, &c.

AT THE ATLANTA EXPOSITION.

[RURAL Special Report.]

THE Cattle Exhibit was much better than I anticipated seeing, and as Southern breeders contributed a great part of it, it showed conclusively that good cattle of some breeds can be raised fully as well in the South as in the North. In this particular section by proper cultivation fine clover can be raised and Orchard and Crab Grasses grown the year round. Bermuda Grass also offers fine grazing the whole year. Animals of all breeds imported from the North should be brought young the better to acclimatize them. The Jerseys seem to do best in this section, and some remarkably fine herds were exhibited. The herd of J. B. Wade, headed by the two-year-old Bull, John Rex 6th; 4579, carried off the first premium. This bull also carried off the premiums for bulls between one and two years old and the sweepstakes premium for Jersey Bull of any age. He was bred by J. Ratchford Starr. Mr. Wade showed seventeen head and among them were some very fine animals; his eight-months calf Luckie Bell is a daughter of Champion of America and traces her ancestry, through her dam, back to Pansy 6th. His four-year-old heifer 'Donna Fay,' 6294, was bought of T. H. Vail whose cattle brought such high prices some years ago. His four-year-old heifer Tennolla, 6712, has made the remarkable milk record of 359 pounds three ounces in one week, the largest day's registering being 55 pounds one ounce. Mr. Richard Peters of Atlanta also exhibited a fine herd of Jerseys. In his herd were the two-year-old-heifer Auta 11,237, bred by Mr. Taylor of N. J., the one-year-old bull Emperor of Belmont, Sire Watts, 2618; Dam, Pride of St. Marys, 3662, bred by W. T. Walters of Maryland, and three fine heifers, Vesperina Baron, 10,103, Willis Baron, 10,109 and Wietita Baron, 10,110, bred by Colman Ayres of Pennsylvania. Mr. G. W. Palmer of Saltville, Va., contributed largely to the success of the exhibit by bringing in a fine lot of Jerseys, Short-horns, Devons and fat cattle, and carried off a fair number of premiums. In his Jersey herd he showed two fine old imported cows: Gem of Springwood 1965 and Rose's Hairbull 3243—also a very handsome yearling bull "Fred Emery." His Short-horns were headed by the three-year-old bull "Rosebud's Oxford" which carried off the first premium. He also showed in this herd a very fine cow Susan 6th. His fat cattle grade Durhams, four in number, averaged 2000 pounds each. Among his Devons he showed the fine three-year-old bull "Eldorado."

Devons followed Jerseys very closely in number. D. J. Whitmore, Casstown, Ohio, carried off the herd premium with a fine Northern herd headed by the 2000-pound eight-year-old bull "Barefoot." Edward D. Hick's of Nashville, Tenn., also had a fine herd on exhibition. The only herd of Short-horns that entered the arena was that of J. R. Anderson, Ohio. This excellent herd was headed by the six-year-old bull "Springdale Airdrie" 2nd, which weighed 2,600 pounds, and the balance of the herd weighed in proportion: they carried off the herd premium.

The great question here seems to be as to what cattle are best fitted for the Cotton Belt. It is generally conceded that the Jer-frame with less twist than the warp, and as soon as that is put in the shuttle the loom is ready to proceed.

The machinery shown in its department if anything excelled the very excellent display made at the Centennial Exposition at Philadelphia. Many improvements have been made since that date and they were all on exhibition here.

After examining the different sorts of cotton as they come from the field, visitors could see all the different processes of manufacture. First the cotton is sent to what is known as the seed cotton cleaner, which removes all the sand, dirt and loose trash, saving the wear of machinery and lessening the danger of fire. It detaches motes from the lint, thoroughly loosens up the cotton, causing the gin to run lighter and cleaning the seed more perfectly, thus rendering the ginning process more healthy and pleasant and at times converting dirty, storm cotton into merchantable shape. Next comes the ginning. There were gins of all styles on exhibition shown in full operation. They are divided into various classes; first, the saw gin with condenser attachment which had the lead in ginning short-staple cotton; next the roller gin which is more especially used for long-staple or Sea Island cottons; and then the belt gin for long-staple or Sea Island. The roller and belt gins are rather slow for short-staple work, and the saw gins are more generally used; but improvements are being rapidly made in the belt gins, and they will probably soon be able to do fully as much work as the saw.

From the gins the cotton goes direct to the press. A large number of presses were on exhibition, hand hydraulic and perpetual. By the hand, or hydraulic the cotton is pressed into bales of from 450 to 500 pounds, weight. It takes about 1500 pounds of seed cotton to make a bale of lint cotton. The hand presses are generally used by the smaller planters and the hydraulic by large planters and cotton presses. The "Perpetual" is a press made by a Northern manufacturer; it puts up very compactly a small bundle known as a quarter bale, of 125 pounds. This small package meets with great favor among the Eastern manufacturers.

After this the cotton goes to the picker, which brings out all the seed shells and imperfections that have been left in by the gins, and here it is wound up in a long roll ready to go to the cards, after having been cleaned of all the dirt remaining in it. Then it goes to the carding machines, and several ends together are then carried to what is known as the railway head where they are united to go into a can for the first drawing. They are then doubled up at the next drawing and put into a can which goes to the "slubber." From there, doubled two into one, it goes to the fine speeder where it is prepared for the spinning frame. Then the warp is prepared many ends on a beam, and several beams on a slasher, where the yarn is sized for warp ready for weaving. The filling is roving taken for warp and spun on the spinning

THE KEMP & BURPEE MANUFACTURING CO. of Syracuse, N. Y., with their accustomed enterprise have upon exhibition the Kemp & Burpee Manure spreader in operation upon the grounds. To the average farmer of this section this is a comparatively new machine and attracts the attention of all visitors to Agricultural Hall. The machine is used for distributing fertilizers of all descriptions, and the cotton planters of this section are particularly interested in the adaptability of the spreader for distributing cotton seed which is largely used by them for fertilizing purposes. It is attachable to the forward wheels of any farm wagon and can be used for an ordinary cart, by simply removing the toothed roller. It completely pulverizes all kinds of manure, whether wet or dry, and the rapid revolution of the roller prevents it from being clogged no matter what may be the condition or quality of the manure to be distributed. It is pretty generally known that complete pulverization and an even distribution of manures are necessary in order that cereals of all kinds shall receive the benefit of all the fertilizer used, and the more perfect the distribution is, the more food is disseminated to the rootlets of the plant. All these points are practically applied in the distribution of manure by this spreader. So completely does it pulverize and so evenly does it distribute that every rootlet receives its proper amount of food and the yield is thus increased, it is claimed, fully one-third. Different sizes are made to meet the wants of the farmers in the North and the cotton seed fertilizers of the South, and from the many sales effected here I conclude that the manufacturers have again been wise in making an exhibition of their spreader at this Exposition.

seys will do well if properly acclimated, all through the South. As to the suitability of Devons there are many different opinions; some claim that they are readily acclimated and do well, while others deny this. As for the fat cattle, it is claimed that pure-bred Short-horns, Herefords and Polled Angus cannot be raised here even if bought when young; but bulls will live long enough to breed to the native cattle and the grades do well.

Atlanta, Ga., W. H. K.

The Swine-Herd.

FOOD ECONOMY WITH PIGS.

COL. F. D. CURTIS.

WE are satisfied that white corn is better for feeding to pigs than yellow flint. The grain is light, containing less fat-forming material; consequently it is not so heating. It makes a more healthy growth, making body (bone and muscle), together with the fat, whereas the harder and richer yellow flint corn makes a preponderance of fat. Pigs will not break down when fed on the former so soon as when fed on the latter. It digests more easily. There is a good deal of waste in feeding raw yellow flint corn, as pigs, especially when feeding, are at first apt to eat more than the stomach will assimilate. There is therefore less danger of cloying and breaking down the digestion. We have a notion that white corn is not so exhaustive to the soil, and we are satisfied that it will yield better on poor land than the yellow varieties.

IT is beneficial to pigs while being fed corn or other heavy food to fatten them, to give them a change every day from stimulating food. They will be found to relish raw pumpkins, apples or roots. If their appetites begin to flag, it is best to increase the quantity of these lighter foods, and to reduce the amount of grain. Fruit and vegetables are cooling to the blood and help digestion. Pigs will fatten faster with less grain and a feeding of these than on all grain, or at least they will make more healthful meat. We don't like for our table a pig which has been stuffed to the verge of founder on clear corn. The feeding place of such pigs may be discerned afar off.

WE are glad to see that cheek is not so highly estimated as formerly. Sagacious swine breeders are learning that body is of more consequence. Cheeky pigs may fill the bill at fairs and win admiration on account of roundness and plumpness and filling lard-tubs, but they don't meet the requirements of the American stomachs. To do this we shall have to improve backwards. We want pigs to eat rather than to look at—long bodies and hams with less fat. Such hogs have longer heads and smaller chops. The markets demand hogs of this style, as consumers do not like the waste of over-fat hams and pork.

ECONOMY in food is generally not much considered when food is cheap; but, nevertheless, it bears the same proportion to the price of pork. When plenty abounds, the farmer is not apt to measure his bushels. He feeds wholesale and wastes wholesale. He throws his corn on the ground and the pigs run over it, tread it into the mud and a considerable percentage is lost. The fattening of animals does not generally allow this margin of loss. A tight floor should be provided on which to feed corn—and this should be kept clean. A pig will neither relish its food as well nor eat so much when it has to dig it out of the mud and eat it smeared with filth. One turns away from such sights with little relish.

EXPERIMENTS have demonstrated that cooking food adds to its value about 25 per cent. for fattening pigs. From this apparent gain must be taken the miller's toll, one-tenth, and the cost and labor of cooking. Very few farmers practice cooking, notwithstanding the increase of the food value. They do not consider that it pays, or else they dislike the trouble. In old times, when farmers figured closer than they do now, it was an almost universal custom to cook all the food for pigs. Pigs will eat more and digest it better when food is slightly fermented. This also necessitates grinding, and on this account it is not generally practiced. It will undoubtedly pay, as the extra gain would more than equal the tribute to the miller. When pigs eat a large amount of meal in a raw state and not soured, it will ferment more or less in the stomach and this condition tends to destroy the appetite and to produce scours.

Literary.

OUR CELLAR DOOR.

EDGERTON.

When I was small—about so high—
We had some neighbors living nigh
Who had a little "chub;"
These neighbors were considered poor,
But, then, they had a cellar door,
And had a washing-tub.

Ah! many a youthful hour I've spent
In sweetest pleasure and content,
Upon that cellar door;
Or, gathered at the washing-tub—
Myself and that same little "chub"—
To sail our vessels o'er.

How well I recollect the night
When first I saw the little sprite
Dressed in the cleanest pink;
I stood a munching gingerbread,
When she shied up to me and said,
"You're awful nice, I think.

"If you'll give me one of your cakes
The next time that my mother bakes
I'll give you one of mine;
And you may come and play with me
And climb up in our cherry tree,
Won't that be real fine?

"And slide down on our cellar door,
Play marbles on our kitchen floor,
Won't *that* be real nice?"
And I, transported with the thought
Of all the happy visions wrought,
Divided in a trice.

It's many years ago, since then,
And I have mingled much with men
And had my ups and downs;
In almost every varied phase,
I've seen life since those youthful days,
In country and in towns.

In all my wanderings, near and far,
That "chub" has been my guiding star
And brought me safely through.
And when I've wavered from the mark,
Her voice has whispered in the dark
"Be careful what you do.

"Act manly, brave and well, your part,
For you're entrusted with a heart
As true to you as steel;
Guard well the sacred precious trust,
And never humble in the dust
The pride in you I feel."

Now, over the corner there,
With hazel eyes and nut-brown hair
You see the counterpart
Of her, who many years before,
Slid with me down the cellar door
And gave to me her heart.

THORNS AND ROSES.

CHAPTER VII.

(Continued from page 738.)

"What do you mean, Edith?"

"Oh, child! how blind you are! Is it that you can't or that you won't see?" and shaking her head, she left me as abruptly as she had entered.

If she had alluded to Nevil's coldness, I had seen that plainly enough, and knew its cause; he had believed Edith's words, and would not ask me if they were true. But I could not speak first; if he were ice I could be snow; if he were flint, I could be steel; yet never having lost an affection before, my heart was heavy, and I could not rest. I thought of the first day I had come here, of my early life, until my musings centered on Brandon; but even this brought pain, a sorrow that had been in my mind lately, to-night more acutely felt.

When I had returned home, I had contemplated a renewal of our old friendship—of the brother-and-sister affection so dear to me in the past. I had hoped for this, and our first meeting had confirmed my hopes. Yet it was not to be; Brandon and I were not to each other what we had once been; a shade had risen between us—not coldness, not unkindness, the man's heart was as warm and loving as had been the boy's; but there was something wanting, or there was something ever lay between us keeping us apart. We had been long asunder; he had grown used to my absence; he was his own counsellor; and time had made me too exacting.

Aunt Dorothy had much to say on the subject of Edgar Dana, and Edith preserved a discreet silence as to the feelings once existing between them. The evening on which he had been invited to return was at hand, and destined to be a memorable one for me for more reasons than one.

We were sitting in the firelight, aunt discussing Christmas festivities, Edith lying back in her chair languidly, when Brandon entered bringing with him a frosty freshness from outside air.

"I am glad you came," said Edith, rousing herself, "because we shall introduce you to Edgar Dana. We expect him, so mind you are lively, and don't sit as if you were meditating on your manifold iniquities, as you generally do."

"I will be good," he said meekly. "What shall I talk about to please your friend?"

"You will be all right if you don't patronize or ignore him—the one irritates, the other hurts him; hit the happy medium."

"What are you going to do on Christmas-day?" interposed Brandon; but our answers were prevented by the entrance of lights—and Edgar.

He was less nervous now, and greeted aunt Dorothy smilingly, and colored as he bowed to Edith and to me—she, in her long, soft dress, looking beautiful. Aunt introduced him to Brandon. I had thought these two would be at ease with each other directly, and that my kinsman would soon win his way with Edgar Dana. He held out his hand with his own cordiality; but, to my surprise, Edgar shrank back, and neither offered his own hand nor took Brandon's, and he looked round at us, as if asking something. What did he mean? He might be shy and nervous; but Brandon was so gentle that he had no need to stand blushing and hesitating, as if he expected my kinsman to strike him.

Aunt and I were sitting together—Brandon examining the sketches on Edith's elaborate easel—when she rose and left the room, and, to aunt's delight, Mr. Dana joined us two. Brandon wheeled the little chess-table to her side, speaking guily enough for him; but Mr. Dana did not play chess, and retired into his "inner consciousness."

"Suppose I give you a lesson?" proposed Brandon; "and aunt Dorothy shall see that I play fair."

I do not know what else he said, but few could be unhappy or uncomfortable with Brandon Lovel, and Mr. Dana consented, but with the same strange hesitation; he looked curiously at my kinsman, at aunt, at myself, as though still seeking an answer to that unknown query. Edith returned, and I left this room for aunt Dorothy's parlor—in darkness save for the "fitful firelight"—and seated myself on the low fender-stool. There was one for whose presence I was longing, despite the change, and had I remained in the other room my thoughts might have been read. How much an idle word can do—only that had changed him! Once he had been so kind, had been so tender, and now?—Edith's song answered me:

"'Now you are cold to me, Robin Adair!'"

And tears rose fast to my eyes. How foolish of me—how contemptible—how unlike Kate Lovel! Then a footstep caused me to rise hastily indeed. I had not heard his arrival—I knew not for how long he had watched me—but Nevil was beside me in the red glow of the fire.

CHAPTER VIII.

I could not speak as I responded to the rather stiff bow with which Nevil greeted me, but I was outwardly calm and composed.

"Don't let me disturb you, Miss Lovel," he said, leaning on the mantle-piece, and studying the wide prospect afforded by the fire, "I trust I do not intrude on your thoughts?"

"Not at all. Suppose we join the others?"

He did not answer and I also relapsed into silence, though I wished he would speak or move, it being so ridiculous for us to stand here speechless. Possibly someone would come in search of us, but I did not wish to avoid what might be my only chance of explanation. My meditations were soon interrupted, for as I bent to light a taper he abruptly changed his position, rattling the unoffending fireirons, and I met his eyes fixed on me angrily, and—the taper went out.

"Are you disposed to accede to the wishes of your Cornish admirer?" he said, scornfully.

"I beg your pardon," I returned, icily; "I do not possess a Cornish admirer, Mr. Verner."

"Ha? Mr. Dana does not come from Cornwall?"

"He is no admirer of mine, even if he did."

"Then how does he happen to visit here, pray?"

"He is a friend of my cousin's, to whom her father wished us to show kindness; and if you desire further information——"

"Not your lover! Was Edith's story false?"

"I had never before spoken to Mr. Dana; she was only speaking in jest."

"How absurd I have been!" cried Nevil, stamping. "How dare Edith say such a thing! I believed it, Kate; and I was so angry, that I would not come to see you, because I thought you were playing with me. I loved you, and you knew it. My dearest girl, I was half mad with jealousy; but now I will speak to you, dear, and tell you of my love. You know it, Kate!"

"And if I do, Nev—Mr. Verner?"

"Then you will love me in return. Ah! do not be so proud and cold! Is it that you doubt me. The day may come when I shall prove the strength and fervor of my love; for a love such as mine can neither change nor falter, and time will show you this. I can't plead—I can't speak as perhaps you wish. Dear Kate, believe me, the devotion of a life shall prove my truth; my heart shall be your refuge! Do you love me?"

I do not know what I answered, if I answered at all, for he caught me a prisoner; and I was so happy that I scarcely heard his passionate pleading as we stood there, "the world forgetting, by the world forgot."

"Kate, do you love me?"

"Yes, Nevil, I do;" and he showed me a little ring brilliant with diamonds.

"See, sweetheart, this is for you; and if you had not loved me I would have thrown it in the sea. Wear it, will you, for my sake?"

"You do love me, Nevil?" I said, touched by the gladness his simple nature did not hide.

"With all my heart, and I may some day prove it. I am not sorry now for Edith's jest, but how could I believe it? You're not angry?"

"Oh, no! But always tell me if I do anything to annoy you. Let us be open and candid with each other, for where there is little trust there is less love."

"Indeed I trust you; and we two shall live for each other. Now I will put this ring on, and you must not take it off until—until our vows are broken—and that means never."

After a pause we left the parlor, Nevil's arm round me until we reached the opposite room, when he released me with a smile.

It was a happy evening; Nevil and I sat together, Brandon singing until it was time for them to go; Mr. Dana had already gone, and whilst waiting for Brandon, who was discussing Christmas affairs with aunt, Nevil beckoned me out to the garden.

Oh, that sweet moonlight night, with the long silver rays resting on the snow—the sky, with its solemn crown of stars, bending over us—the soft, low voice of the wind sighing through the leafless trees! We walked to and fro in silence, charmed by the beauty of the scene; and I thought of my lover, of him to whom I now belonged. When he had asked my love he had not forgotten his manly dignity, he had not stooped to slavish worship and flattery, and I admired him all the more. The sound of my kinsman's voice, singing as he came down the avenue, roused me, and called me back to earth. He seemed little surprised at my being here; and as I watched my lover and my friend go away together. I wondered if one would tell the other of the engagement. Returning to the house, I told aunt Dorothy all.

"My dear Kate, how delighted I am!" she cried. "Nevil is so good—you will be so happy!"

She sat turning my ring round and round, and talking of Nevil, until Edith came in, who, hearing the news, looked curiously at me, and aunt left us together.

"I suppose you are in a state of bliss," said my cousin calmly staring. "Was he very overpowering? Did he sing his own praises, and tell you how honored you ought to feel?"

"Edith, you have one opinion of Nevil Verner; I another. As I am not always telling you of his virtues, will you be silent as to the faults you find in him?"

"*You* find none? Cousin mine, I will say no more; you see him now at his best, and will do so until he finds another. He values a thing until he wins it, and he has won your love. You have seen a child run after a butterfly—to use an old simile—and Nevil has caught his butterfly, and will be charmed with it till another, more difficult to capture, flits before him more difficult, therefore of more value. Good-night, my love, good-night!"

She left me, singing gaily to herself.

The morning dawned so brightly that I resolved to ride out and exercise Diamond; and shortly after breakfast I set out alone, Edith declining to accompany me, on the plea of a headache. I was glad to be alone, for I wanted to think of yesterday; to realize that I was engaged to Nevil, and loved by him. Kindly words greeted me as I passed through the village; a future, clear as the sky, lay before me, for though sorrow and troubles might come, there would be always one on whom I could rely—one true heart my refuge. The faults in my character he would help me to overcome; trusting and loving, we would walk hand-in-hand through life.

Happy as I could be, I rode on. Passing the boundary of my own estate, and entering my kinsman's, I wondered if I should meet him. Blue smoke curled from the chimneys of the straggling cottages, a robin crossed my path, and a yellowhammer chipped on the low stone wall. Just as I turned a corner I beheld a sight that made me smile. An old woman—bent, feeble, and decrepit—a stalwart man supporting her with one arm, on the other carrying a battered basket, and a horse brought up the rear. My kinsman, of course; and I watched him escort his companion to a little roadside cottage, hand her the basket, and bow as if she were a duchess. He had just remounted, when I cantered up and greeted him.

"Riding as usual, Kate! Shall we ride on together?" he said, quickly.

"I saw you with that old lady!"

"Oh! she slipped over a stone, and——"

"And you dismounted, helped her up, and carried the basket. Ah! I never find you but you are doing good to someone—doing some kindness of which you alone would think! Anyone else would not have dismounted."

To be Continued.

For the Young.

A COUSIN'S EXPERIENCE WITH SEEDLINGS.

I THOUGHT I would write my first letter to you and my cousins. I will tell you what I am trying to do. Last Summer, late in June, I planted one Charles Downing strawberry and about eight weeks ago eight little plants came up, and one of them died about a week ago. I have them growing in the house now. October 10 I planted about 75 Concord grape seeds, and I have some seedling potatoes. I will tell you how I got them. Last Fall, 1880, as soon as there were ripe potato balls on the vines, I planted some in a box and put it in the house. The seeds germinated and grew nicely until Nov. 25, when I removed them to the cellar. In the Spring I took them up and planted them out. They grew nicely. This Fall when I dug them I was greatly surprised at what I found in the hill. There were 33 potatoes, varying from a robin's to a bantam's egg in size and of all colors, kinds and shapes. One of the vines died down about two weeks before the Beauty of Hebron did. If nothing happens next Fall I will tell you more about them. Last Fall I took 15 Cherry Currant cuttings and left four buds on each. These I put in the ground, leaving one bud above ground. This Spring I went to see how many had started. There were twelve. This Fall I set them out; they were about seven inches high. I set out altogether about 75 currant cuttings, and I have now 85 currant bushes in all. Last Spring I set out about fifty quince cuttings and now have 12 small bushes. I planted them the same as I did the currant, except I covered them with a few leaves or hay and watered them often so as to keep the ground moist. If the cousins have no currant or quince bushes they can take grape cuttings and, leaving from three to five buds on a cutting, put them in the ground in a slanting direction and leave one bud out of the ground. The Concord will be a good kind to practice on. I have a lot of cuttings of grape vines to set out this Fall. The Delaware grape you cannot well start without laying a branch down. I procured cuttings from the following named vines: two Salems, two Marthas, two Crotons, two Crevelings, one Brighton and two Eumelans. Of the 11 cuttings two Salems, one Martha, two Crotons, one Creveling and one Brighton lived. In a little while I will send Uncle Mark a kind of plant which grew in my strawberry bed last Summer. I want him to tell me the name of it when I send it.

Blackstone, Mass. O. F. FULLER.

[I am greatly pleased to hear that one member of the Club, at least, is succeeding so well with seedlings. The writer of the above letter is on the right road to successful fruit raising and his example I hope will be followed by many others of the club.—U. M.]

KEEPING FRUIT IN WINTER.

OPINIONS differ greatly upon this subject, but there is one point upon which all are agreed and that is that the lower the temperature above the freezing point the better it is for keeping fruit of any kind. Some people are of the opinion that a damp atmosphere is best, but I have good success in keeping apples in a very dry cellar and I cannot see why it would not be equally good for other fruits.

I think the difference in seasons has some effect upon the keeping qualities of fruit for some years apples and pears will keep well while, perhaps, the next they will rot badly under precisely the same conditions. Moreover there is a great difference in the keeping qualities of different varieties of fruits. In securing a kind of apple or pear that will keep well one should look for firmness of flesh and thick skin, though there are some objections to the latter. But whatever variety of fruit one may have it is absolutely necessary that it should be handled with the greatest care in picking, packing, etc. I have seen fine fruit absolutely spoiled for long keeping by the carelessness of the pickers who bruise it when gathering. Judging from my own experience I should say that it is much better to keep fruit covered, especially that packed in shallow boxes or bins. This is necessary in most cases in order to maintain a uniform temperature. When packing apples or pears which are long keepers it is best to use barrels or deep boxes; but this is not advisable for fruit that does not keep well, as it will be bruised too much in sorting. WILL.

YOUNG QUERIST.

N. L. A., Freehold, Pa., asks, 1, how are seed distributions conducted by the Department of Agriculture at Washington, D. C.; 2, is the Saxon Importing Company reliable.

ANS.—1. There is no stated time for making the distributions of seed. Applications for seed should be made through your Senator or

Representative at Washington. 2. We know nothing to the contrary.

O. W. F., Blackstone, Mass., asks what we think of the following named grapes:—August Giant, Moore's Early, Eumelan and Wyoming Red.

ANS.—August Giant is quite similar to Martha, very sweet and foxy and larger in berry and earlier. It drops from the stem badly. Moore's Early is a decidedly valuable grape on account of its earliness. It is almost identical with the Concord, its parent, both as to fruit and vine, except that it ripens with Talman and other early varieties. It cracks badly. Eumelan is a delicious grape when it can be successfully grown, but it is one of the most uncertain varieties in cultivation. Wyoming Red is also known as Wilmington Red, Hopkins's Early Red, Chemung Red. It is an early grape, very hardy and a heavy bearer. It is exceptionally free from mildew and other diseases, and is rich, sweet and pleasant. It drops from the stem easily, but, on the whole, is a desirable grape, both for the table and for market.

New Members of the Club for Week Ending Nov. 12.

Domestic Economy

CONDUCTED BY EMILY MAPLE.

A CRIME AGAINST CHILDHOOD.

MARY WAGER-FISHER.

LATTERLY, in my morning drives, I have seen the children of the neighborhood wending their way to school, and my attention has been attracted by their lack of erectness, produced by the high heels on their shoes. I observed a number that were round-shouldered, and in eight out of every ten, perhaps, the perpendicular line fell at the back of the head. Perched on high heels, the natural pose of the body must be to incline forward.

If adult men and women choose to sacrifice their own health in wearing high heels, it is a matter that principally concerns themselves. But a child has a right to wise and judicious care, and to oblige the tender, growing creature to walk, run and stand with the heels lifted a half or whole inch above the rest of the sole of the feet, is monstrous, is criminal, and this crime against children is so widespread that it is amazing—except that nothing need be regarded as amazing—that it continues to be perpetuated with so little protest from physicians and such aids as they ought to find in really intelligent people.

It is true that the children of fashionable people—and by fashionable I mean people who possess high social position, intelligence and usually a competence of wealth—wear shoes without heels, or with what is called the "spring" heel, until six to eight years of age, and from that time on until twenty the heel is kept broad and low. But as one descends in the scale of intelligence and common sense he will find the high heel growing more and more prominent, until children of even the tender age of two years will be found perched upon them trying to walk. I sometimes wonder that preachers who have eyes to see the sins of the people against their bodies ever find time to preach against the sin of the soul.

The greatest crime caused by high heels is the ill and sometimes disastrous effect produced upon the spine. On girls in particular very serious harm is inflicted otherwise—a result that should be avoided at all cost. Minor ill effects are produced upon the muscles of the legs, and the flat part of the foot, which is forced to support more than it ought. The toes and the large joint become distorted, corns and bunions begin to form, and the foundation is laid for a great deal of suffering in the future, as well as for present aches. I suppose that a lady whom I saw last Summer may be taken as a general exemplification of a great many mothers. She had money and plenty of wit, and, in the main, excellent sense. She had two beautiful young daughters of 13 and 15—beautiful, except that neither had beautiful feet. Those members had been stuffed into narrow-soled, narrow-heeled, narrow-toed, high-heeled shoes, until the feet were shockingly deformed. The father of the girls was a large shoe dealer. His son's feet were very finely shaped. He wore broad-soled, broad-toed, low-heeled shoes. Why the feet of the daughters had not been allowed an equal chance in the world with those of the son I couldn't well make out. One of the girls was wearing shoulder braces to make her straight, and one day, as the mother was deploring the child's round shoulders, I ventured to say that I thought low-heeled shoes would be better for her. "I quite agree with you," exclaimed the mother. "The girls wear too high heels all the time, but somehow we neglect having the heels cut off. But it *must* be done." Whether the cutting-down process has begun I don't know, but I thought if those girls were under my control not 24 hours would pass before their feet went into "common-sense" shoes.

No class of people are quicker to respond to the demands of the public than are manufacturers, and if buyers demand a certain sort of shoe they will very soon get it. It is possible that in a great many country towns low-heeled, broad-soled shoes cannot so readily be had as the reverse. But the high heel can always be lowered by having the shoe dealer cut off several layers of leather. He never likes to do it, and will try to convince you that the heel is none too high, etc., etc. But if you insist upon it he will cut the heel down to suit you sooner than lose your custom. That children with crooked and bow-legs, turned-over ankles and other weaknesses of feet and legs, so abound among the lower classes is not at all to be wondered at when one considers the extremely bad way in which they are usually shod. Mr. Beecher not long ago put into a prayer this sentence:—"Lord, help us to be patient with the *ignorance* of others." To combat ignorance is, beyond all doubt, the most difficult and trying thing humanitarians have to encounter. But I believe that as much harm results from procrastination and carelessness and a lack of energy in instituting reforms where intelligence exists as from ignorance. If people would only do as well as they know, the world would take a long leap ahead. High heels and narrow soles are almost as bad as the Chinese method of compression. The dwarf King of France who brought them into fashion to increase his apparent stature probably never dreamed how many fools there were adown the generations of time to imitate his example. The beauty of any member of the body consists in its outline—its shapeliness and *proportionate* size, instead of its littleness. A small foot, or hand, is only comely in connection with a small person, while any part of the body that has been made small by compression is simply vulgar. Freedom is as necessary to beauty as purity, and there is no freedom where nature is being cruelly violated, as she maintains her rights most bravely, and when overpowered leaves in her train a line of woes full of torture and humiliation. Finally, do not omit to keep high heels from under the young people's feet.

DOMESTIC RECIPES.

Oysters.

FRIED OYSTERS.

Drain, dip each oyster into a little cold water to remove bits of shells, and place where it is cold for half an hour. Then roll each into powdered cracker, then into beaten egg, and again into the cracker. Fry in hot butter and drippings (half and half) until delicately browned on both sides. Drain and serve at once. Garnish with parsley.

BROILED OYSTERS.

Select large oysters, rinse in a little cold water, dry on a napkin; dip each into melted butter, then into cracker-dust, and broil over a good fire.

SCALLOPED OYSTERS.

Wash a quart of solid oysters in very little water to remove sand and shell. Strain the water, adding juice, and, if necessary water, to make a pint of liquor. Roll enough crackers to make a pint of crumbs. For seasoning use salt and pepper to taste and a half cup of melted butter. Mix the pepper, salt and butter with the crackers. Put a layer of crumbs in a buttered dish, moisten with a few spoonfuls of the liquor; then put in an even layer of oysters. Repeat until everything is used. The crumbs should be last. Cover and bake half an hour. If the top crumbs seem too dry, add a few bits of butter and a little hot water. Very nice for tea when something hot is wanted. MRS. V. T.

CORN CAKES FOR BREAKFAST.

One cup of Indian meal, two cups of flour, three eggs, yelks and whites beaten separately, a small teacup of sugar, half a cup of butter, two cups of rich sour milk, one teaspoonful each of soda and salt. Stir the butter until creamy, beat the yelks to a froth and the whites until stiff, and put together lightly. The salt and soda should be mixed thoroughly with the flour and meal. Next stir the butter into the middle, turn in the eggs and sugar and beat to a batter. Now, as this mixes, add the sour milk, stirring rapidly. Beat hard until smooth and light. Bake in hot gem-pans or small cake-tins. Excellent. MARY B.

QUESTIONS ANSWERED.

S. E. B., Buckeye Center, Ill., asks how to clean a granite kettle.

ANS.—We know of nothing better than filling the kettle with a strong, hot solution of washing-soda and water and letting it remain on the back of the range where it will keep hot for several hours. Afterwards rub with sapolio or brick-dust.

D. LANGELL'S ASTHMA & CATARRH REMEDY.

Having struggled 20 years between life and death with ASTHMA or PHTHISIC, treated by eminent Physicians and receiving no benefit, I was compelled during the last five years of my illness to sit on my chair day and night gasping for breath; my sufferings were beyond description. In despair I experimented on myself by compounding roots and herbs and inhaling the medicine thus obtained. I fortunately discovered this WONDERFUL CURE for ASTHMA or CATARRH, warranted to relieve the most stubborn case of Asthma in FIVE MINUTES, so the patient can lie down to rest and sleep comfortably. Any person not fully satisfied after using one-third of a box can return the remainder to the proprietor and the money will be refunded, or send me your address for a trial package FREE OF CHARGE. Should your druggist not keep the remedy, I can send it by mail on receipt of the price $1.00. For sale by all Druggists. Address D. LANGELL, Proprietor, Wooster, Ohio, or ALBERT IMGARD, Manager, 46 Astor House Offices, New York City.

News of the Week.

HOME NEWS.

MONDAY, Nov. 14, 1881.

THE LATE ELECTIONS.—Election day was a very quiet one in this city as well as elsewhere. The revised returns from every county in this State show that the Republican State ticket with the exception of Husted for Treasurer, is elected, by a majority of 11,000. The Democrats will probably have a majority in the Legislature of six on joint ballot—that is two in the Senate and four in the Assembly. The Democratic majority for the State ticket in this city was about 40,000. In Brooklyn the Republicans elected a Mayor by over 4,000 majority when 14,780 majority was given to the Democratic candidate for State Treasurer. In MASSACHUSETTS the Republican State ticket, headed by Long for Governor, was elected by 36,000 majority. CONNECTICUT returns a reduced Republican majority in the Legislature, the Senate now standing Republicans 17, Democrats 7, and the House, Republican 149, Democrats 98, Greenbackers 1. PENNSYLVANIA gives the Republican candidate for State Treasurer about 7,000 plurality. The Independent vote in Philadelphia reached about 35,000. In VIRGINIA, Cameron, Readjuster candidate for Governor, is chosen by a majority of about 11,000. The Readjusters claim the legislature by 15 votes on joint ballot. WISCONSIN shows large Democratic gains for a Republican State. The Republicans elect their Governor by a fair majority, and will have a light majority in the Legislature. The temperance vote reached 25,000. MISSISSIPPI gives a Democratic majority of 15,000 or 20,000. In NEBRASKA only three State officers were voted for, the Republicans winning by from 15,000 to 18,000. They also elected their ticket in MINNESOTA by about 35,000, though there was a falling off of 40 per cent. in the entire vote. In New Jersey the Democrats made considerable gains but not enough to change the complexion of the State Legislature.

Two tenement houses in this city suddenly collapsed on the 9th inst, killing eight persons instantly and injuring about 25 others.

The trial of Guiteau begins to-day at Washington. It will probably continue for some time. A large number of witnesses have been summoned on both sides.

Ten boilers in the extensive lumber and salt manufactory of Hamilton McClure & Co., six miles below East Saginaw, Mich., exploded on the 13th, wrecking property valued at $26,000 and killing four firemen—Michael and Joseph Lehan, Frank Blanchard, and Charles Carpenter. Low water in the boiler caused the explosion.

The annexation of Northern Idaho to Washington is again agitated, and with it the question of the admission of the new State of Washington to the Union. The new State, with the addition suggested, would have an area exceeding eighty thousand square miles, or as great as that of New York and Ohio combined.

The increase of internal revenue receipts over the corresponding period last year is very large, and surprises even the internal revenue officials. The net increase during the months of July, August, September and October over the same months last year amounts to $7,299,337.26. At this ratio the receipts during the present year will amount to $150,000,000.

A full bench of Justices in a Massachusetts State court has decided that women are not eligible as lawyers in the Bay State.

All the personal effects of the late President, stored in 30 boxes, including books, pictures, etc., have been removed from the White House, at Washington, for shipment to Mentor. The Alderney cow presented to the late President was also placed on a train, and will be sent to Mrs. Garfield at Cleveland.

All the open country lying between the north end of the Sny Levee and south of Quincy, Ill., is to be leveed as soon as work can be commenced, and the damaged levees are to be repaired. The following are believed to be accurate estimates of the damage done by the recent flood:—Entire losses in the Warsaw Drainage district, $600,000; in the Indian Grove District, $750,000; in the Sny Island district, $1,000,000; on Quincy Bay and in the city, $30,000; in and about Alexandria, Mo., $250,000; to the Keokuk and St. Louis Railroad, $100,000; to all other railroads, $60,000; to open lands north of Sny Levee and immediately south of St. Louis, $150,000, making a total of $2,940,000.

The State House of Texas, at Austin, was burned on Thursday, with the Court reports and valuable portraits and library.

Illness has prevented Mr. Henry W. Longfellow from seeing visitors for three weeks past.

Josiah Henson, the original of the hero of "Uncle Tom's Cabin," died lately in Canada, leaving a mourning family of eleven children, forty-four grandchildren and six great-grandchildren.

Gov. Long, of Massachusetts, has made a new departure from the usual style of Thanksgiving proclamations. His announcement consists mainly of four verses of Scripture and four stanzas of poetry.

The total loss in the Canadian provinces by bush fires during the past season is estimated at between $10,000,000 and $15,000,000.

The proprietors of the Boston Herald, Messrs. Pulsifer, Haskell and Andrews, have started on a Southern tour in a special car. It is said that the yearly income of each from the newspaper is $50,000.

Mrs. Garfield, Miss Mollie and Masters Herbert and Abram are now comfortably quartered in their new Cleveland home, No. 1,106 Euclid avenue. They left Mentor for that city on Monday, and it is Mrs. Garfield's intention to reside in her present home until April next, she having made arrangements with Judge Burke to occupy the house until that time. She will probably make Mentor her Summer home.

To provide dinner for passengers on the new fast Chicago train, a man will daily accompany it from New York to take down numbers and letters indicating the kind and number of dishes of different sorts which passengers desire. These are enclosed in an envelope and thrown off at Poughkeepsie, whence they are telegraphed to the Albany restaurant. At Albany, men enter the train with baskets containing the dinner and serve it, remaining on the train till Yosts is reached, where water is taken. A stop of twenty minutes is made at Buffalo for supper.

Dakota Territory will apply for admission to the Union as a State during the next Congress. The territory is rapidly filling up at the present time. In 1880 it had a population of 135,180, which has increased since that time to 165,000 or 170,000. Arkansas, Florida, California, Oregon, Kansas, Nevada and Nebraska were admitted to the Union with a population ranging from 50,000 to 123,000 less than that of Dakota.

Lawyer Trude, of Chicago, finds that his legal engagments there will prevent his participation in the Guiteau trial, and he telegraphed Mr. Scoville on the 9th, to that effect. Mrs. Parker, who is considered an important witness by the Scovilles, applied to the United States Marshall yesterday for transportation to Washington, stating that she had no means to pay her own expenses. Mrs. Scoville has spent all her money already, and was provided with passes for herself and daughter by Trude.

At Madison, Ind., Mrs. Sarah Mosely has died at the age of 111 years. Her oldest child, Mrs. Renfrow, is 87 years old.

Smallpox having been carried to California by immigrants from Chicago, the State authorities have decided to inspect all immigrant trains and quarantine the passengers and cars where evidences of the disease are found.

At Spring Lake, Mich., 9,000,000 feet of lumber, worth $250,000, were burned on Wednesday.

Brilliant Results.

There cannot be found, in the journals of any school of medicine, an account of such brilliant cures as have been made, during the past ten years, in a *wide range of chronic diseases*, by the Compound Oxygen Treatment. In a single number of our quarterly journal, *Health and Life*, will be found a record of cures, some of which would make the reputation of any medical practitioner. Not a day in which our large correspondence with patients does not bring us new reports of cures, or ameliorations of distressing symptoms, or expressions of thankfulness and gratitude for relief from pains which have tortured for years, and for which no treatment had hitherto availed anything. Our Treatise on Compound Oxygen, containing a large report of cases, and full information, *sent free*. DRS. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.—*Adv.*

AGRICULTURAL NEWS.

MONDAY, Nov. 14, 1881.

THE following items of agricultural news are condensed from telegrams received here from last Friday evening till noon to-day: Boston, Mass. Corn quiet; prices in favor of buyer. Oats ditto. Pork and lard stronger. Beef still dull with prices, if anything, still lower. Beans in less demand than usual. A fair trade has been done in wool, mainly in fine washed and unwashed fleeces. A remarkable steadiness still in values attests the general confidence in high prices in the future. Consumers, as a rule, are slightly stocked, and will need all the available wool before the new clip comes to market. Stocks at primary points in Ohio, Pennsylvania and Wisconsin are very light and held firmly at full prices. Texas and California clips are held above a parity with the seaboard rates, and supplies are accumulating.....Philadelphia, Pa.—Fair trade in flour and grain with prices ranging near last week's quotations. A good deal of speculation in canned goods. A steady market for choice lots of potatoes; trade in other sorts easier. Butter is firm with a good demand for choice quality for a high price. Wool sales the smallest of any week since July; but prices continue firm..... Cincinnati, Ohio.—The grain markets touched bottom last Monday, and have rallied since. To-day (Saturday) they are stronger with higher prices for wheat corn, and oats. Corn has advanced about five cents since Monday .....Evansville, Ind.—Some of the mills hereabouts are shutting down, not being able to buy more wheat; farmers are holding for higher prices.....Louisville, Ky.—Tobacco firm and steady.....Detroit, Mich.—Wheat market sensitive and unsettled, with a bullish drift. Bad roads checking movement of grain in the interior. Country collections therefore slow but satisfactory.....Milwaukee, Wis.—Receipts of cereals continue light, though sufficient to supply the demand—the impassable condition of interior roads prevents shipping. Flour still dull and weak; a considerable reduction in prices has been made to bring about a free movement. The millers here are trying to induce those at St. Louis, Minneapolis and other chief milling centers to suspend work until either wheat falls in price or flour rises. Negotiations still going on to this end.....St. Louis, Mo.—Pinkeye has nearly disappeared and the freight blockade is substantially lifted. Excellent hogs are arriving in large lots. Cattle market lively; but only light-weight stock is coming in. All grains are showing a downward tendency.....

Minneapolis, Minn.: Another week of rainy weather, with but brief intervals of sunshine, and colder to-day. Farm work has been at a stand-still owing to condition of the roads. But little thrashing has been done during the week. Considerable damaged wheat is offered for sale. Market dull; No. 1 wheat closed Friday at $1.16, a decline of 7c. Several of the mills have shut down. More will do so to-day (Saturday). All are purchasing wheat and hold about 1,500,000 bushels. Good flour is held firmly. Lumber market active; sawmills still in operation.....Kansas City, Mo.: Weather very favorable. A large movement of grain to the seaboard may be looked for if present reduced prices continue. The high prices heretofore ruling left no margin for shippers, hence transactions have been confined to consumers' wants, and a good deal of money has been locked up in grain, which is now being released.....Omaha, Neb.: More rains have kept the country back. Travel is bad and farmers are unable to market their crops as largely as they would otherwise. Collections poor for last three weeks, but a better condition of roads will improve matters. Corn is selling at 55@60c. Hogs are bringing $5.50 per hundred, and all produce commands high prices.....

Denver, Col.: Politics have engrossed all attention during the week. Partisan feeling very bitter. General trade rather quiet except fruit. Snowy weather prevailing. Much satisfaction that Denver has been selected to be the permanent capital of Colorado.....

San Francisco, Cal.: Wheat uncertain, but $1.75 is offered for primest shipping; second, $1.65½@1,67 per cental. Barley and oats on the upward grade. Ample tonnage in the harbor. Great trouble lately between farmers and hydraulic miners. The mighty streams of the latter washed away whole acres of bluffs, and when the rivers rose in the wet season the tailings, called "slickens," swept down on the rich farming bottoms, covering them with sand and debris and ruining them agriculturally. A committee of the Board of Trade has been examining the matter and recommends a compromise, the miners to build stone dams along the gulches to restrain the slickens. A joint convention of farmers has ratified the recommendation....

Baltimore, Md.: Wet weather until latter part of the week. Wool firm; demand good; supply only moderate. Breadstuff market quiet; tone in favor of buyers. Spot and December delivery of wheat steady; corn dull. Dealings in former more speculative. Cotton prices steady and firm. Provisions dull, but order trade active and steady. Butter commands high prices; demand for good grades increasing. Tobacco market quiet, but good grades find ready sale. Stock market has been dull.....Wilmington, N. C.: Weather cool, with rain. Cotton receipts and prices good. Provisions and general trade better. Rice receipts increasing. The mills here produce a first-rate article....Charleston, S. C.: Cotton coming in lively. Indications of cooler weather.....Savannah, Ga.: Cotton very firm, with an upward tendency. Demand strong at quotations. Weather very unseasonable.....Atlanta, Ga.: Owing to short cotton crop merchants are making greater efforts to collect debts than to sell.... ....Augusta, Ga.: Weather still warm and favorable for cotton picking. In adjoining counties nearly all the cotton has been gathered; but the bulk of it is still in the country, planters waiting for better prices whenever they are not too much in debt. Since Sept. 1, receipts have been 23,967 bales less than for the corresponding time last year.....New Orleans, La.: cotton firm and in demand. Receipts of sugar and molasses light; prices sustained. Warm weather is unfavorable for sugar and delays receipts.....Memphis, Tenn.: A good demand for hay and oats at higher prices. Cotton receipts 2,000 bales behind last year and are falling off steadily owing to the short crop and disposition of planters to hold for higher prices.....

Nashville, Tenn.: Grain and flour market dull; flour lower. General produce market active. Feathers in good demand and fair prices with a downward tendency. Wool dull; prices lower. Hogs in fair demand; but packing hasn't opened yet and packers are prudent in purchasing. Some decline in prices of lumber, especially of black walnut. Cotton receipts lighter, but sales good and market active.....

Halifax, Nova Scotia: Accounts from Prince Edward's Island are particularly good: farmers are getting high prices for their produce and though the crops are generally under the average of former years, yet the advance in price of exports will give the island a higher aggregate than for the past four years. Flour here is steady with a fair demand.....Winnipeg, Manitoba: Winter has set in here in earnest, with snow, frost and ice a week ago. Fall plowing has been well gotten through with, and the area under wheat next year in Manitoba and the Northwestern Territories will be largely in excess of previous years.... The Nashville American says that from 18 to 20 cents per pound are paid in that city for the kernels of black walnuts. They are used in the manufacture of fruit candies, and are brought to Nashville in large quantities from the Northwestern States, although in middle Tennessee alone thousands of bushels are permitted to rot on the ground every year.....

The Cotton Planters' Convention at Vicksburg, on October 25, adopted three resolutions of moment to Southern planters, requesting Congress to remove the tariff duties on cotton ties, pledging co-operation with the Iowa Farmers' Alliance in its war on the wire fences, and calling another convention of the farmers and planters of the cotton States, to meet at Atlanta on December 5 next. The Galveston News says that "in view of the fact that the American cotton tie manufacturers are already protected to the extent of 35 per cent., and are clamoring for 70, it behooves the producer to take immediate steps not only to prevent the increase, but, if possible, to get rid of the unjust tax of 35 per cent. on the ties.".....Advices from Buenos Ayres, dated September 14, state that rain has fallen almost continuously since the departure of the preceding mail. This was welcome, and the farmers were, consequently, hoping for a good crop year. The winter months were nearly over, and shearing will be now about beginning. According to the Buenos Ayres Standard, it was estimated that, in consequence of the great increase of the flocks, the yield of the wool will be 20,000 bales larger this season than last. There was, however, still a large quantity of last season's wool left on hand, and the severe weather had checked the export trade, so that the position generally was not favorable to an upward movement in prices, at least so far as Argentine wools were concerned.....

A peculiar real estate venture at Wayne, thirteen miles from Philadelphia, will bring together a population of 3,000 in another year. The company bought 600 acres for $250,000, and spent $100,000 in landscape gardening, $50,000 for a water supply, and enough in drainage to swell the total investment to $500,000. The building lots are an acre each, and the purchaser is bound to select one out of twenty striking designs for a residence, costing $2,000 to $8,000. Picturesqueness is further provided for by fixing the exact spot on which the house shall stand, and locating the trees to suit the landscape. A first payment of a third part of the cost of the land and improvement is all that is required, the rest remaining on mortgage on easy terms. There will be no bar-rooms.....A cable from Dublin says: "No fewer than 400 landlords have intimated that they are willing to sell their estates, but not a single tenant has expressed the wish to buy."

An ex-consul of Great Britain says that the Brooklyn Eagle related that Mr. Charles Townsend, Sedalia, Mo., was cured of rheumatism of the worst kind by St. Jacobs Oil.—Indianapolis (Ind.) Sentinel.

Habitual Costiveness

is the bane of nearly every American woman Every woman owes it to herself and to her family to use that celebrated medicine. Kidney-Wort. It is the sure remedy for constipation and for all disorders of the kidneys and liver. Try it now, either dry or liquid.—News and Courier.

Let the poor sufferers from female complaints take courage and rejoice that a painless remedy has been found. We refer to Lydia E. Pinkham's Vegetable Compound. It is prepared at 233 Western Avenue, Lynn, Mass. Send to Mrs. Pinkham for Pamphlets.

A Fine Hair Dressing.

COCOAINE dresses the hair perfectly, and is also a preparation unequalled for the eradication of dandruff.

THE superiority of BURNETT'S FLAVORING EXTRACTS consists in their purity and great strength.

The Markets.

SPECIALS FROM THE CHIEF CENTERS

Until Saturday, November 12.

CHICAGO.—WHEAT active, firm and higher, but unsettled; No. 2 Chicago Spring, $1.30⅛@1.30¾, cash; $1.30¾, November; $1.32@1.32⅛, December; $1.33@1.33⅛, January; sales at $1.30⅞@1.32¾, December; No. 2 $1.31⅝@1.33¾, January; No. 3 do., at $1.17; rejected, 92@94c. CORN active, firm and at 60c., cash and November; 60¾@60⅞c., December; 61⅛@61¼c., January; 65⅜c., May; sales at 60⅜@61¼c., December; 65¼@66¼c.; rejected, 58c. OATS moderately active and higher at 43⅜c., cash; 43⅞c., November; 41¼c., December; 40½c., May. RYE firmer at 96½@97c. BARLEY firmer at $1.07. FLAX-SEED weak and lower at $1.47 bid. PORK active, firm and higher, at $16.50, cash; $16.30@16.40, November, December and all the year; $17.45@17.47½, January; $17.67½, February. Lard active, firm and higher at $11.25@11.30, cash and November; $11.35@11.37½, December; $11.60@11.62½, January; $11.75@$11.77½, February. Bulk-meats firmer; shoulders, 6¼c.; short rib, $8.95; short clear $9.25. HOGS—market strong and fully 5c. higher than on Friday; fair mixed packing, $5.65@6.20; choice heavy, $6.25@6.60; light $5.75@6.10; culls and grassers, $3.50@5.40. CATTLE—market generally active and stronger, but export demand weak and supply meagre at $6@6.80; good to choice shipping, $5.40@5.90; common to fair $4@4.95; butchers' steady; inferior to fair $2.10@3; good to choice, 3.30@4.10; stockers and feeders very active and firmer at $2.60@3.80; rangers steady; Texans, $2.90@3.95; half-breeds and natives, $3.90@4.40.

ST. LOUIS.—WHEAT opened lower than yesterday, advanced, and closed lower; No. 2 Red Fall, $1.38⅝, cash; $1.40⅛, December; $1.42⅛, January; $1.45, February; sales at $1.39⅝, December; $1.42¼, January; $1.44¼, February; No. 3 do., $1.28¾; No. 4 do., $1.18½. CORN opened higher but declined; 63⅜c., cash; 65½c., December; 65⅝c., January; 66¼c., February; 69c., May. OATS better at 44c., cash; 45½c., December; 46½c., January; 49½c., May. RYE slow at 97c. bid. CATTLE—Supply too light to make a market; only a small retail trade done. SHEEP—Receipts, 300 head; shipments, 150 head; market very quiet and unchanged. HOGS about steady; light shipping, $5.10@5.60; Yorkers, $5.85@6.10; mixed packing, $5.50@6.15; butchers' to fancy, $6.20@6.60.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Nov. 12, 1881.

The business week has been materially interrupted by the interest in election affairs, and also by the excitement on the Produce Exchange respecting the adjustment of arrangements for the new and valuable edifice to be erected. Many cotton dealers are absent at the great Southern Cotton Exposition.

BEANS AND PEAS.—Outside of strictly choice marrows there is so little demand that a weak feeling has become positive. There are of course some strong holders, but more people are handling beans than usual, and some of them perhaps cannot stand a lull. Green peas vary in quality; best quoted $1.70; Southern N. E. peas again higher, quoted $3.30@3.25 ₱ 2 bushel bag.

Marrow beans, prime, $3.10; fair to good, $3.15@3.25; medium, choice, $3.20. fair to good, $3.00@3.10; pea, choice, $3.30@3.35; white kidney, $3.40@3.45; red kidney, $3.00; old, $2.00@2.85; turtle soup, $1.80@1.90.

Receipts of beans for the week, 10,712 bush.
Exports do. 351 bbls.

BEESWAX.—Quoted 21@22½c.

BUTTER.—Cool weather has enlarged the demand and fine creamery and selected half tubs are firm; very extra a shade higher than last week. The assortment of quality does not favor the increased attendance of buyers. Many distributors at this season want a sound, sweet, useful grade of stock that has not yet appeared in lots. In fact, there is a noticeable falling off in quality of heavy State dairies that have heretofore sold upon their brand. Fresh Western in good condition sells readily; poor and medium grades very dull and dealers are generally willing to make concessions even on the latter.

Creamery, State and Elgin, choice, 36c.; good to prime, 33@35c.; sweet cream, fresh, 32@33c.; fair to good, 28@30c.; State, June, good to prime, 25@28c.; Western, choice, 34c.; good to prime, 30@32c.; fair to good, 28@30c.; poor, 18@23c.; June, prime, 26@27c.; fair to good, 22@25c.; State firkins, dairies, choice, 28c.; good to prime, 25@27c.; fair, 22@24c.; poor, 18@20c.; dairies, half tubs, choice, fresh, 32@33c.; good to prime, 28@30c.; fair to good, 25@28c.; Welsh tubs, choice, fresh, 31@32c.; good to prime, 27@29c.; fair to good, 24@27c.; poor to fair, 18@23c.; Western imitation creamery, 30@30c.; Western dairy, fresh, choice, 26@27c.; good to prime, 23@25c.; fair to good, 20@23c.; poor to fair, 17@20c; factory and ladle-packed, Iowa, fine June, 17½c.; Ohio and Indiana, June, good, 17c.; late made, good, 16@16½c.; fair, 15@15½c.; poor, 14@14½c.

Receipts for the week, 20,821 pkgs.
Exports do. 1,570 do.

CHEESE.—The feeling is weak with an accumulated stock, especially of the under or sharp grades. Shippers' moderate purchases are directed to fine Fall and the outlook for other grades is not hopeful.

State fact'y, fine, Sept. 12½c.; good to prime, 11@12c.; fair to good, 10@11c.; poor to fair, 9@10c.; Ohio factory, flat, fine mild, —@——c.; good to prime, 10@11c.; fair to good, 9@10c.; creamery, partly skimmed, choice, 9@10c.; poor to good, 4@7c.; fully skimmed, 2½@3c.; full-skimmed factory, 2½@3c.

Receipts for the week, 31,562 lxs.
Exports do. 13,100 do.
Liverpool cable, 57s. 6d.
Steam to Liverpool, 128. 6d.@17s.

COTTON.—The week has not shown a marked improvement. Bureau reports confirming injury to the crop have caused much interest, with the natural effect of giving some strength to prices.

CURRENT PRICES FOR SPOT COTTON.

Quotations based on American standard of classification and on cotton in store, running in quality not more than half a grade above or below the grade quoted.

Receipts for the week, 44,264 bales.
Exports do. 4,956 do.

DRIED FRUITS.—The following are the ruling quotations.

Apples, evaporated, new, 13½@14c.; fair to prime, 12@13c.; N. C. new, sliced, fancy, 8½@9½c.; fair to choice, 6½@8c.; Southern quarters, choice, 6@7½c.; State, old, fine-cut, choice, 7@7½c.; quarters, do. 6½@6 7c.; small lots, 6¾@6¾c.; Ohio and Mich. choice, 6½@6 7c.; Western, fair to good, 5¾@6¼c. Peaches, evaporated, peeled, old, 35@40c.; unpeeled, new, 18@20c.; N. C. peeled, fancy, 24@25c.; choice, 22@23c.; fair, 22@ 23c.; Southern, peeled, fair to good, 18@20c.; unpeeled halves, N. C. 8½@9c.; halves, Tenn. 8½c.; quarters, 8¾c.; Plums, State, black, 17c.; Southern Damson, 15@15½c. Blackberries, 13c. Cherries, Southern, dry, 19@20c. Raspberries, 28@29c. Huckleberries, 15@16c.

EGGS.—Receipts for the week, 8,576 bbls.; do. last week, 8,106 do. Eggs have held an upward course and all fresh lots close firm. Southern eggs turn out poorly; limed also firm. A number of stall eggs are offered at 23@24c.

Jersey, single barrels, 32@33c.; Pa. and State fresh mid, 28@29c.; Canadian, 26½@27c.; Western, 27c.; Western and Canadian, fair to good 23@26c.; limed State, 23c.; Canadian and Western 21@21½c.

FLOUR.—Another week of steady decline is reported liberal deliveries having weighed heavily on the market. Exporters have operated lightly and there is an accumulation in the good low shipping brands. For home use grades the market closes with some steadiness but only on the basis of easier figures. Buckwheat flour arrives from few points. Penn. will have little to spare.

No. 2, $3.25@4.30; State and Western, superfine, $4.30@5.25; city mills, XX, $6.00@7.85; Spring wheat, extra, $5.40@5.85; Spring XX and XXX, $6.00@6.75; patents, $6.50@8.50; Ohio round hoop shipping, $5.60@6.00; trade brands, $6.15@6.65; St. Louis extra, $5.70@6.10; do. double extra, $6.25@6.50; do. family, $6.65@7.00; Southern extra shipping, $4.85@6.40; do. XX and family, $6.60 @7.25. Rye flour, superfine, $5.10@5.40; buckwheat flour ₱ 100 ℔s, $4.70@4.90. Corn meal, Brandywine, ₱ bbl, $3.80@3.85; do. Western, $3.25@3.80; rye feed, ₱ ton $23@24.

Receipts of flour for the week, 121,503 bbls.; corn-meal 3,111 do.

Exports of flour for the week, 41,349 bbls.; corn-meal 2,289 do.

FRESH FRUITS.—Exports of apples for the week, 4,850 bbls. High prices have induced shipments and quality is very variable. Pears dull. Grapes are down to few sorts and prices are firm. Cranberries firm for prime. Florida oranges not yet attractive.

Apples, Baldwin and Greening, fancy, ₱ bbl, $3.37@3.50; good to prime, $3@3.25; N. Spy, State, $2.75@3; seconds, $1.75@2.25; mixed lots, State, prime, $2.75@3; do. seconds, $1.75@2; Phœnix, Jersey, ₱ round hoop bbl. $2.50. Pears, Duchess, State, ₱ bbl. $3.50@5.00; Lawrence, $3@4.50; Vicar of Wakefield, $2@3; cooking, $1.50@2.00; Boston bush. bxs, fancy, $4@5; poor to good, $1@3. Quinces, apple, prime, ₱ bbl. $3; No. 2, $2@2.50. Grapes, Catawba State, case of 18 3-℔, bxs, $1@1 5; bskts, ₱ ℔. 7@8c.; Concord, bskts, 2@5c.; Isabella, bskts, 3½@11c. Florida oranges, half-bbl. bxs, fancy, $4@5; good to prime, $3@3.50; inferior, $2.00@2.75; tidrds, fair to prime, $2.50@3; inferior, $2@ 2.25. Cranberries, Cape Cod, fancy, large, ₱ bbl. $9.50@10; prime to choice, $8@9; good to prime, $7.50@ 8; poor to fair, $5@6.50; frosted $3@3.50; ₱ crate, $2.50@ 3.25; New Jersey, fancy, $2.75@2.85; good to prime, $2.37@2.63; fair to good $2.12@2.37; poor to fair, $1.75@ 2.12; frosted, 50c.@$1.

Pecans, Va., hand-picked, ₱ ℔, 7@7½c.; fancy, 6½c.; extra prime, 5½c.; good to prime, 5¼@6c. shelled, 50@55c.; pecan nuts, 9@11c.; hickory, shell-bark, Northern, ₱ bu. $1.25@1.37; Western, $1.12@1.25; hull, 50@60c.; black walnuts, 30@40c.; chestnuts, Southern, $5@6; Northern, $6@7.

GRAIN.—Wheat has ruled weak, but at the close there is a stronger feeling owing to a lighter movement from the interior and some reduction of accumulations by an increased export demand.

Corn has not been largely dealt in, but prices hold up well.

Oats have fluctuated through speculative manipulation, but wind up about as well as at our last.

Wheat, Spring, $1.25@1.10; Spring No. 2, $1.36@1.38; red Winter No. 2, $1.42½@1.42¾; red Winter, $1.30@1.44; white Western and State, $1.30@1.31. Rye, 98c.@1.03; Oats, white No. 1, 53c.; No. 2, 51½c.; No. 3, 49@49½c.; mixed, No. 1, 48c.; No. 2, 47½c.; No. 3, 45@46½c; Corn, Western mixed, 69@70c.; No. 2, 68½@69c.; yellow, 68@72c.; white, 70@74c. Barley, Canada No. 1, $1.13@1.15; do. bright, $1.15@1.17; State 1-rowed, $1@1.02. Buckwheat, 90c.

Receipts for the week, wheat, 772,630 bush.; corn, 1,136,175 do.; oats, 183,900 do.; rye, 41,575 do.; malt, 55,100 do.; barley, 180,950 do.

Exports for the week, wheat, 557,650 bush.; corn, 267,100 do.; oats, 19,200 do.

HAY AND STRAW.—Exports for week 1,920 bales. There is no material change to report. Receipts have been light but business has been somewhat interrupted by the occurrences of election day and by rainy weather, and the supply has been sufficient. Only fancy Timothy reaches $1.10.

Prime Timothy hay, ₱ 100 ℔s., $1.00@1.10; medium Timothy, 80@95c.; shipping grades, 65@70c.; clover mixed, 70@80c.; clover, 60@70c.; Straw, long rye, 75@ 80c.; short rye, 50@60c. oat and wheat straw, 40@45c.

HONEY.—Quotations are:
White clover, fancy, 1-℔ bxs, ₱ ℔, 20c.; do. 2-℔ bxs, 18@19c.; good to choice, 1@2 ℔ bxs, 15@17c.; buckwheat 1-℔ bxs, 14@15c.; 2-℔ bxs, 12@14c.

HOPS.—The Producers' Price Current says: "The market is ruling generally quiet."

Crop of 1881, choice, 28@29c.; good to prime, 25@27c.; fair to good 22@25c.; eastern, 18@27c.; 1880, good to prime, 18@22c.; poor to fair, 10@15c.; 1879 fair to prime, 8@15c.

Receipts for the week, 2,770 bales,
Exports for the week, 900 do.

MILK.—Supplies have run light and a high week is reported. Commission lots opened at $2.75 and soon ran up to $4 ₱ can of 40 quarts. Average quoted $3.53¼. Price paid to farmers for October mainly 3½c ₱ qt.

POULTRY AND GAME.—Dressed poultry is not averaging good in quality and prices are easy. Thanksgiving stock should be here by Nov. 21st.

Turkeys, Phila. prime, 14@16c.; J'y 13@15c; State and W'n d.-p, 12½@14c.; scalded, 11½@13c. Chickens, Phila. spring, 16@18c.; Bucks Co. do. 15@16c.; Jersey, do. 13@15c.; State, do. 12@14c.; Western, do. 11@13c. Fowls, Phila. dry-picked, 14@15c.; Bucks Co. 13@14c.; Jersey, 12@14c.; State and Western, dry-picked, 1@2 13c.; scalded, pr, 10@12c.; inferior, 8@10c. Ducks, Spring, Phila. ₱ ℔, 16@18c.; Jersey and Bucks Co. 15@17c.; State, 14@15c.; old, fair to good, 10@12c. Geese, Phila, dry-picked, young, 13@14c.; do. old, 10@ 12c.; State and Western, old 9@10c. Squabs, white, ₱ doz. $2.75@3; dark, $1.75.

Cooped stock is firm at the moment, but with possible free receipts of dressed there is not much stability to the market.

Chickens, Jersey, spring, ₱ ℔, 11½@12½c.; State and Penn. 11@11½c.; Western, and Southern, 10c.; Fowls, 11@11½c; Jersey, State & Penn. 10@11c.; Western and Southern, 10@11c. Roosters, old, 5@6c. Turkeys, J'y and Penn. 10@12c.; Western, 8@10c. Ducks, Jersey, extra-large, ₱ pair, $1@1.25; Jersey, New York and Penn. 60@75c.; Western, 45@55c.; Southern, 45@50c. Geese, Jersey, $1.50@1.75; N. Y. and Penn. $1.25@1.50; Western mixed $1@1.25; Southern, 75c@$1. Pigeons, large, strong birds, 25@30c.; young, 5@12c.

Wild ducks are quoted at $2.50@2.75 for Havre de Grace and $2 for Western canvasback; 80@90c. for Havre de Grace, and 75c. for Western redhead; 40@60c for Western mallards, according to quality, 30@60c, for teal and 30c. for common.

Quail, ₱ doz. $1.25@2.50; grouse, choice, ₱ pr 75c@$1; soft, 40@60c.; partridges, State and Western, $1@1.12½ Eastern & Minn, 50@60c.; soft, 40@50c.; Woodcock, choice, 65@75c.; inferior, 50@60c.; English snipe fresh-killed, ₱ doz. $2.00; plover, do. $2.00; rabbits, ₱ pair, 30@40c.; venison, Minn. short saddles, ₱ ℔. 15@16c.; Western, 14@15c; whole deer, 10@11c.

PROVISIONS.—A low tone has attended most hog products during the week and at the easier rates Continental and English buyers have taken rather large lots of lard. Barreled pork has ruled quiet, but at the close there were some speculative bids. Bacon is heavy under large Western stocks.

Mess pork $17.50@17.87; smoked hams 13@13½c; pickles 10½@11c; shoulders smoked 8½c; shoulders pickled 7½c. Lard—prime steam $11.35@11.37; bacon, long clear 9@9½c; beef unchanged.

Receipts for the week—Beef, bbls. and tcs. 2,544 pork, bbls. 11,925; cut-meats, pkgs 20,785; lard, do. 15,133,

Exports for the week—Beef, bbls. and tcs. 2,500; pork bbls. 3,175; cut-meats, ℔s. 4,210,039; lard do. 3,059,850.

SEEDS.—Clover seed arrives moderately and has a fair demand.

Clover, Western, 1881, car lots on track, 8¼@8¾c.; Timothy: job lots in store, $2.85@3.25; Flaxseed, American, rough, ₱ bu. $1.60@1.65.

Receipts for the week, 15,050 bush.
Exports do. 3,655 do.

TOBACCO.—The asking points of attractive stock are above the views of consumers. Buyers of seed leaf refuse to regard the strong quotations of the past few weeks as being positively established.

VEGETABLES.—Exports of potatoes for week 3,922 bbls. Potatoes are firm at the late shading for choice stock. Common are too close to full prices for trade.

Potatoes—Early Rose, Eastern, ₱ d.-h. bbl., $2.50@3; State, $2.25@2.75; bulk, ₱ bbl. $2.25@2.62; Prolific, Eastern, d. h. $2.50@2.62; Snowflake, State, $2.37@2.75; bulk, ₱ bbl. $2.25@2.62; Burbank, d.-h. $2.50@2.75; bulk, ₱ bbl. $2.25@2.62; Peerless, $2.25@2.37; Mercer Eastern, ₱ d.-h. bbl, $2.25; sweet potatoes, Va. yellow, ₱ bbl. $3.25@3.50; Del. River, $3.75@4; Jersey, $3@3.50.

Garden truck firm with cooler weather.

Onions, white bulk, ₱ bbl. $4.75@5; yellow, $2.25; red, rust, $2.25; red, Chester, $2@2.25; squash, Marrow, ₱ bbl., $2@2.25; Hubbard, $2.25@2.50; cabbage, ₱ 100, $6@10; beets, L. I. ₱ bbl. $2.25@2.50; carrots, $1.25; turnips, Russia, L. I. $2@2.25; cauliflower, fancy, $5@7. average quality, $1.75@2.50; inferior, 50c@$1; celery, ₱ doz., $1.25@2.

WOOL.—A fair degree of activity is to be noted. Holders of domestic fleeces feel encouraged with the limited chance of foreign coming into competition.

LIVE STOCK MARKETS.

NEW YORK, Saturday, Nov. 12, 1881.

BEEVES.—Receipts for the week, 15,021 head; do. last week, 12,080 do. A good many poor droves have been on sale and Monday's market lost money for owners. Texans and Colorados sold at 7½@8¾c. to dress 55 ℔s.; poor to fair natives at 8@10½c. to dress 55@56 ℔s. good to choice do. at 10¾@12¾c to dress 56@57 ℔s.—outside figures for 12 picked Kentucky steers of 1,583 ℔s. average. Two car loads of fine Dutchess County cattle at 12c. to dress 57 ℔s. A half dozen car loads of State dry cows changed hands at $11@13 ₱ head.

MILCH COWS.—There is no special change in the range of $35@75 for common to choice, but there are more attempts at "bearing down" than for a few weeks past.

VEAL CALVES.—The season has run well for calves and prices continue strong.

Hog-dressed country, choice, 13½@14c; fair to good, 12@13c; grass, 5½@6½c; live calves, N. J. prime to choice, 9½@10c.; do. State, 9@9½c.; fair to good, 8½@ 9½c.; poor to fair, 6@8½c.; Mount Hollys, 7@9c.

SWINE.—Receipts for the week, 28,719 head; do. last week, 29,287 do. General price for live $6.75 ₱ 100 ℔s. New Jersey dressed light 9@9¾c.; other weight 8@ 9c.; city dressed, 8¾@8¾c. Pork tenderloins, 12½c.

SHEEP AND LAMBS.—Receipts for the week, 27,418 head; do. last week, 36,926 do. Prime stock was in demand at firm prices. Export goods $5.85 ₱ 100 ℔s, but 3½@5¼c, was the general range for sheep, with sales of lambs at 7¾@7¾c.

ALL the prize lots of butter, eighty-three in number, of the recent London Dairy Show were salted with Higgin's Eureka Salt. The Higgin process has revolutionized the dairy salt business of Great Britain.—American Dairyman.—*Adv.*

Great Offers for 1882!

Full-Size Paper Patterns!

PETERSON'S MAGAZINE is the *best and cheapest* of the lady's books. It gives more for the money and combines greater merits than any other. It has the
BEST STEEL ENGRAVINGS,
BEST COLORED FASHIONS,
BEST DRESS PATTERNS,
BEST ORIGINAL STORIES,
BEST WORK-TABLE PATTERNS,
BEST MUSIC, ETC., ETC.

Its immense circulation and long established reputation enables its proprietor to distance all competition. In 1882 it will contain a brilliant series of

Splendidly Illustrated Articles.

The stories, novelets, &c., in "Peterson" are admitted to be the best published. *All the most popular female writers* contribute to it. In 1882 about 100 original stories will be given, and in addition six COPYRIGHT NOVELETS. The

Colored Steel Fashion Plates

in "Peterson" are ahead of all others. These plates are engraved on steel, TWICE THE USUAL SIZE, and are unequalled for beauty. They will be superbly colored. Also, a FULL-SIZED PAPER PATTERN for a dress every month. Also, Household and other receipts; articles on Art Embroidery, Flower Culture; in short, everything interesting to ladies.

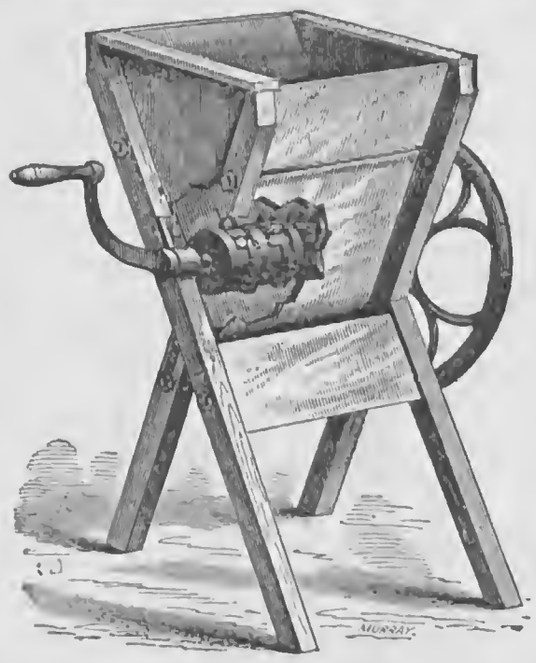
CLARK'S IMPROVED ROOT CUTTER



PERFECTION OBTAINED IN
Cutting Roots.

This Cutter has *received* the First Premium *at every Fair*, and has no *equal*. Do not fail to examine it.

The Neatest, Strongest, Simplest, Cheapest, and most Perfect Root Cutter in the Market.

This Cutter is built with a heavy oak frame, well bolted together; is staunch and strong, neatly finished, handsomely striped and ornamented. The cutting apparatus consists of *twenty-five Steel Knives*, (gouge-shaped), so arranged on a wrought iron shaft that they are perfectly secure; no chance of becoming loose or breaking. The roots are neatly cut in pieces suitable for feeding. No coarse ungainly pieces are left by this Cutter. A boy can easily cut 35 to 40 bushels per hour, so easily does it do its work.

☞ Don't fail to examine it.

We are manufacturing three sizes, designated by numbers, —1, 2 and 3.

Nos. 1 and 2 designed for hand use.

No. 3 is the Power Cutter and will cut 100 bushels per hour.

Price, No. 1..... $12.00
" No. 2..... 14.00

PERSONALS.

General Burnside's estate was so heavily encumbered that his heirs will get nothing.

The late President's fiftieth birthday anniversary falls upon the 19th instant. It is proposed in Cincinnati to hold a semi-centennial observance.

Secretary Blaine, along with Justices Swayne and Bradley, have sons in the civil service. Four sons of Secretary Hunt are in the service of their country.

Thomas G. Alvord, of Syracuse, N. Y., recently received the 141st annual rental of a salt farm of 300 acres in the town of Schaghticoke. The farm has been in the Alvord family since 1740.

The Ottawa, (Kan.) Republican thus quotes: Mr. Harvey B. F. Keller, recorder of deeds, says: I have long been convinced of the merits of St. Jacobs Oil, and use it in my family for rheumatism successfully.—*Adv.*

BEATTY

PIANOFORTES.

A RECENT ADVERTISEMENT

A.—BEATTY'S PIANOFORTES.—" Magnificent holiday presents; square grand pianofortes, four very handsome round corners, rosewood cases, three unisons, Beatty's matchless iron frames, steel, book, cover, boxed, $222.75 to $297.50; catalogue prices, $800 to $1,000, satisfaction guaranteed or money refunded, after one year's use; upright pianofortes, $125 to $255; catalogue prices, $500 to $800; standard pianofortes of the universe, as thousands testify, write for mammoth list of testimonials; Beatty's cabinet organs, cathedral, church, chapel, parlor, $30 upward; visitors welcomed; free carriage meets passengers; illustrated catalogue (holiday edition) free. Address or call on DANIEL F. BEATTY, Washington, New Jersey."

☞ IMPORTANT!!! ☜

☞ I want it distinctly understood that I am prepared to offer to the public greater inducements to buy PIANOFORTES FOR HOLIDAY PRESENTS than ever before. Why buy Grand, Square and Upright Pianos and pay manufacturers such enormous profits. Before you decide to purchase a Piano elsewhere, stop! Write at once for valuable information. Tricks of the trade Where the cost comes in; how a $297 50 Piano cost $1000 through agents—profits of from $500 to $700 made on a single sale. A $1000 Piano sold to one man for $800, to his neighbor, the same Piano precisely, for $970, to another for $650. *Is this just?* I have one price, no agents, sales are made direct, my catalogue has no fictitious prices—ONE PRICE TO ALL.

PENSIONS

Secured. Also Bounty, Back-pay, Increase of Pensions. New and Honorable Discharges, Patents, &c. Thousands entitled. New Laws. Now is the time! Do not delay! Soldiers, Widows, Children, Parents, Brothers and Sisters entitled. Have your claim investigated. Apply at once. Send two stamps for blanks and instructions complete, to—

A $6.00 REVOLVER FREE TO YOU.

WEIGHT 7½ OUNCES

THIS CUT IS 2-3 SIZE.

THE BLUE JACKET

is the most elegant Revolver in the world, as well as the most perfect and beautiful in design and finish. It is made of the very best steel. The barrel and frame is Nickel Silver-plated, with Gold-plated Cylinder, Ivory Stock, and the whole beautifully engraved and enameled, making a beautiful contrast of four different colors. The cut represents it only *two thirds the actual size*, and as it is impossible to show the beautiful contrast of *Gold, Silver, Blue and Ivory*, it conveys but a slight idea of this handsome weapon. It is simply beautiful beyond description. It is the first IVORY HANDLE, ENAMELED AND ENGRAVED REVOLVER ever sold for less than $6.00, and is the most remarkable bargain we ever offered in fire-arms. This Revolver cannot be made to-day for twice what we are offering it for, and it will be a long time before we shall be able to offer another such bargain. We have 5,000 only; when these are sold, no more can be had except at regular prices. **THE BLUE JACKET** is as well known as any Revolver in the world, and the new Russian Model Hip Stock exactly fits the hand, enabling you to hold it firmly and steadily. It has a *finely rifled barrel*, positive stop-action holding the cylinder firmly in place, and uses the extra-long cartridge. With the BLUE JACKET you can shoot a squirrel or partridge from the tallest tree. We guarantee its shooting qualities, and if you are not perfectly satisfied with it WE WILL REFUND THE MONEY EVERY TIME. We purchased these Revolvers at less than *one-fourth their cost*, and we wish to give all who read this the benefit, and at the same time introduce our publication **THE HOUSEHOLD GUEST MAGAZINE.** *If you will send us* **$2.00,** and TEN CENTS EXTRA to help pay postage, we will mail the Magazine *one year, and the* REVOLVER FREE of all other charges. THE HOUSEHOLD GUEST MAGAZINE contains 33 quarto pages, with handsome Illustrated Engraved Cover, and is filled with choice Illustrations *from all parts of the world. Stories by the best authors; Poetry; Anecdotes, Sketches; Illustrated Fashion Department; useful information; Statistics, Answers to Correspondents; Household Notes; The Kitchen; Ladies' Items; The Toilet Table; The Garden; Wit, Humor, &c.* It is now in its fourth year, has a large circulation, and the regular price for a year's subscription has always been **$1.50.**

FREE TO YOU. If you will cut this advertisement out, show it to your friends, and get a club of *seven* to join you, and send us $14.00, with 70 cents extra in stamps to help pay postage, we will send you the Revolver and Magazine free for your trouble. **PLEASE BEAR IN MIND** that each one in the club will also get the Revolver and Magazine, and when full amount $14.70 is sent with the club order, we will put in a box of cartridges for each Revolver. As to our reliability, we refer to any New York Publishers or Merchants. Send money by Registered Letter or Post Office Order at our risk.

Address, **E. C. RIDEOUT & CO., 10 Barclay Street, N. Y.**

THE TARGET Illustrated here was made with the BLUE JACKET at 21 yards. Every shot being put in a bull's-eye one inch in diameter. **CUT THIS OUT, IT WILL NOT APPEAR AGAIN.**

VALUABLE BOOKS at 2½ CTS. EACH!

READ THIS GREAT OFFER By One of the Most Reliable Publishing Houses in New York! Realizing the great popular demand for books, and being determined to outdo all competitors, we have just published, *in neat pamphlet form, handsomely illustrated,* **Ten Valuable Works,** by some of the greatest authors in the world, all of which we will send *by mail post-paid, upon receipt of* **Only Twenty-five Cents** *in postage stamps!* The titles of the books are as follows: 1. **Sketches of Foreign Travel,** an interesting and instructive description of the wonders of strange foreign lands, manners and customs of the people, etc.; with 19 Illustrations. 2. **Household Art and Home Adornment,** containing easy and practical Instructions in Drawing, Oil Painting, and making Wax Flowers and all kinds of fancy articles, such as Baskets, Wall Pockets, Work Baskets, Fancy Needlework, Embroidery, etc.; with 77 Illustrations. 3. **Our American Humorists,** a large collection of the most laughable writings of all the celebrated "funny men" of the present day. 4. **Farm, Garden, and Household Economy,** a book full of valuable information for the farmer and housewife, with any quantity of new and useful recipes. 5. **"The Fatal Marriage,"** a novel, by Miss M. E. Braddon, author of "Lady Audley's Secret," etc.; illustrated. 6. **"The Mystery of Morwick Farm,"** a novel, by Wilkie Collins, author of "The Woman in White," etc.; illustrated. 7. **"Under Life's Key,"** a novel, by Mary Cecil Hay, author of "For Her Dear Sake," etc.; Illustrated. 8. **"The Lust of the Ruthvens,"** a novel, by Miss Mulock, author of "John Halifax, Gentleman," etc.; Illustrated. 9. **"Passion Flowers,"** a novel, by Beatrice May Butt, author of "Miss Molly," etc.; Illustrated. 10. **"Vanolenne,"** a novel, by the author of "Stainless," etc.; Illustrated. Thus you will see that there are six splendid novels and four other works, making ten in all, and *we will send you the entire lot, by mail post-paid, upon receipt of* **Only Twenty-five Cents** *in postage stamps.* Was there ever such a chance for getting *so much for so little money before?* Twenty-five cents invested in these books now will furnish enjoyment for the whole family for *many a long evening* during the coming winter, to say nothing of the *valuable information* you will derive from them. *Just think of it*—ten **valuable Books for 25 Cents!** *Don't miss the chance! Send for them,* and if you can conscientiously say that you are not perfectly satisfied, we will refund your money and make you a present of them! Not less than the entire list of ten will be sold. **For $1.00 we will send Five Sets** *of the ten books;* therefore by showing this advertisement and getting four of your neighbors to buy one set each, you can get your own books free. As to our reliability, we refer to any newspaper publisher in New York, and to the Commercial Agencies, as we have been long established and are well-known. Please state in what paper you saw this advertisement. Address,

F. M. LUPTON, Publisher, 27 Park Place, New York.

Humorous.

A YOUNG man who didn't like the color of his hair wrote to a chemist asking, "What is the best dying receipt?" The chemist wrote back, "Fool with a loaded gun."

GRAMMARIANS are puzzled over the question whether "mumps" and "measels" are singular or plural. They often look singular, but that is no criterion on a question of this kind.

AN Iowa editor thus acknowledged a present of grapes: "We have received a basket of fine grapes from our friend W., for which he will accept our compliments, some of which are nearly two inches in diameter."—Cincinnati Gazette.

A SCOTCH packman, having paid some fruitless visits to one of his customers, called a few days ago for an installment of his debt. But the customer told her son, a lad of five years, to say she was "in the toon." Accordingly, when the packman called and asked, "Where is your mother the day?" the boy promptly replied. "In the toon?" "What toon?" asked the peddler. The boy having no further instructions from his mother, went to the next room and shouted, "Mither, what toon are ye at? He wants to ken!"—Weekly Free Press.

NATURE AND ART.

Youthful Artist (to Countryman).—"Might I go over there and paint those trees?"
Countryman—"Paint the trees, Maister! don't thee think they look very well as they are?"

ANNOUNCEMENT.
YOUTH'S COMPANION
1882
THE PUBLISHERS

Have spared no effort to present an Announcement of new features for 1882, that shall represent the best ability in entertaining literature. The names of a few of the writers and a selection from the topics are given below.

Its Serial Stories.
These are by writers of rare gifts and experience. Several of the Stories will illustrate topics that are engaging public attention.

A Serial Story, Illustrated. . . . . By W. D. Howells.
A Live Story for Boys. Illustrated. . . . . By J. T. Trowbridge.
An English Story. Illustrated. . . . . By William Black.
Witchcraft at Deacon Wiggins'. . . By Mrs. Harriet Beecher Stowe.
Four Nights Among Russian Nihilists. . . By a Writer in Russia.
Tales of Old New England Taverns. . . . By Rose Terry Cooke.
Stories of Successful Business Men. . . . . By James Parton.

Its Stories of Adventure.
Incidents of Frontier Life and Adventure in the West; in Africa; in Australia; in Greenland; in China, Japan and Corea; in Russia; in New Zealand; on the Ocean. Fully illustrated.
A Pioneer School Mistress in the Far West: Her experiences—amusing, often thrilling—related to her Eastern friends. By Adeline Hall.
Lost in the Gran Chaco; or, Six Weeks in a South American Wilderness: A Six Weeks' Flight among the Cannibals. Illustrated.
Perils of a Linesman's Life: Guarding a Telegraph Wire in Sumatra. Illustrated. . . . . By Lieut. Grinnell.
On Recent Battle Fields. Illustrated. . . By Archibald Forbes.
A Story of South Africa. A Serial Story. By Capt. Mayne Reid.

Very Valuable Articles.
The Ministers of the English Government during the Revolution, By E. P. Whipple.
The Beginning of Great Industries, ... By James Parton.
Life Scenes, as a Clergyman sees them, . . By Rev. Henry Ward Beecher.
Success and Failure in Life, ... By Canon F. W. Farrar.
Other Recollections of Authors, ... By the late James T. Fields.

Illustrated Travel.
China.—Incidents and facts connected with ten years of official residence in China; in which personal adventures, incidents of social intercourse with the people; and detailed views of every-day life in China will be given.
By Hon. Chester Holcombe, U. S. Legation, Pekin.
Russia.—Life in the out-of-the-way Nooks and Corners of Russia, given in a picturesque and striking series of articles. The author has been sent to Russia by the *Companion* especially for this purpose.
By Mrs. A. H. Leonowens.
Mexico.—A Naturalist's Adventures on the Mountains of Mexico, by one who is travelling in that country for Scientific Societies. By Fred A. Ober.

The Editorials, as heretofore, will be prepared by the most qualified pens, and all current topics will be treated clearly and fundamentally.
The Children's Column will be under the same popular management as for the last fifteen years, and the Prize Department will be more liberal than ever.

Subscription Price, $1.75, Specimen copies sent free.
Please mention in what paper you read this advertisement.
YOUTH'S COMPANION, Boston, Mass.

A GOOD SAW MILL
For $200.
Our No. 1 Plantation Saw Mill is designed to be run by 8, 10 or 12 horse-power Agricultural Engines. With this power from
1,500 to 4,000 Feet
of lumber can be cut in a day—a product 25 to 50 per cent. greater than can be cut with any reciprocating saw mill with the same power. The mills are complete except saw, and will be put on the cars in Cincinnati for the low price of $200, and warranted in every particular. Saw Mills of all sizes. Engines and Boilers, Shafting, Gearing, etc. Illustrated circulars sent free.

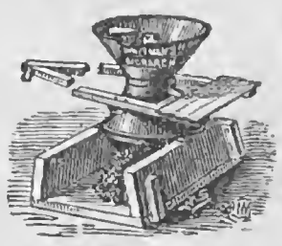
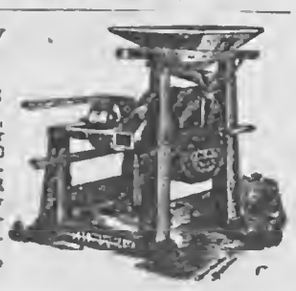
Monarch and Young America
CORN AND COB MILLS



Only mills made with
Cast Cast Steel Grinders
Warranted superior to any in use, for all purposes. Will grind faster, run easier and wear longer. *Satisfaction guaranteed.* Also, Corn Shellers, Feed Cutters, Cider Mills, &c. Send for circulars and prices.
Manufactured by
WHITMAN AGRICULTURAL CO.,
St. Louis, Mo.

Special Offer.
TEN POUNDS of our NEW CROP OF TEAS, Black Green or Mixed, sent by express, charges paid, on receipt of $6.00.
A Beautiful Oil Chromo, Size 20 by 24, of our lamented President
GARFIELD
Will be mailed with every $6 order.
Now is your time to ENJOY A CUP OF GOOD TEA at almost Half Price, and a Perfect Likeness in Oil of our martyred President, or Get up Clubs among your friends. On $20 orders we deduct 15 per cent. off, *pay all express charges*, and enclose the Chromo, one for every five pounds.
The Great American Tea Company,
(P. O. Box 289.) 31 AND 33 VESEY ST., N. Y.

Mill Manufactory
Established 1851.
CRIST MILLS,
Of FRENCH BURR STONE



Portable Mills for Farmers, Saw Mills etc.; 15 sizes; over 2,000 in use. Price from $80 up. Complete Mill and Sheller $95. A boy can grind and keep in order. Adapted to any kind of suitable power. Complete Flouring and Corn Mills.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME.

VOL. XL. No. 1661.} NEW YORK, NOV. 26, 1881. {PRICE FIVE CENT $2.00 PER YEAR

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Field Crops.

NOTES FROM THE RURAL FARM.

Quack, Creeping Wheat, &c.—Triticum repens.

FIRST and last, a great deal has been said and written about Couch Grass—called also Quitch, Quick, Scutch, Rye, Dog, Chandler, Witch, Quake, Squitch and Quack Grass. It is called botanically Triticum repens, which signifies Creeping Wheat, and of all its "common" names this seems to be the most appropriate. As a wheat it is worthless, the grain being small and shriveled, while the heads, which in good soil are often over a foot in length, bear but few grains and many none at all. As to its value as a pasture grass or for hay, there is no difference of opinion, that we know of. It is conceded to be as valuable, or nearly so, as Timothy, while a greater quantity may be raised upon a given area. It will endure the severest droughts of the North; it will thrive in sandy or clayey soils; it is early to appear in the Spring; it is the first to carpet a field with green after it has been mown or closely cropped; it makes a compact sod for the door-yard or lawn, and will become as "velvety" under the frequent use of the lawn-mower as the Bent Grasses, Red Top or Poas. Its merits are many. We do not know of any true grass about which more may be said in its praise. The great fault with Quack is that it seems to be too much of a good thing. Upon this farm and, in truth, upon most portions of Long Island, this grass may be found in many fields and in almost every hedge. A field recently plowed for corn next Spring, which had been in grass for eight years or more, was nearly all Quack—Timothy having disappeared entirely, and the rest forming a small percentage of Blue Grass and Red Top. The cultivation which we shall give the corn will practically subdue the Quack unless the next Summer should prove unusually wet, so that when Timothy and clover are again sown upon the wheat at the end of the rotation there will be scarcely any to dispute their possession. But Quack would reappear in several years and if the land, as in the above case, were retained in grass for six years or more, the Quack would again largely predominate. As our lands are sandy with gravely sub-soil, they need frequent rains so that a season rarely passes without a drought of lesser or greater severity prevailing. It is then that Quack is easily destroyed. The shallow corn cultivator, always here used, exposes the Quack roots to the parching air and sun and destroys them. In retentive soils, we presume it is difficult to get rid of Quack and no surprise need be entertained that its general reputation is that of a pest. Upon this farm Quack is a blessing, though perhaps a troublesome one. We do not believe there is another grass which, when plowed under, will furnish a greater amount of suitable food for Indian corn while the cultivation given for suppressing its Summer growth is no more than that which a full corn crop needs.

Several engravings of this Quack, or Creeping Wheat, have appeared in the RURAL NEW-YORKER from time to time, but always reduced in size and not quite accurate. Our present illustrations (p. 795), are carefully drawn from life from specimens sent from this farm. The smaller A is the flowering or seed-bearing stalk; the smaller B a portion of the roots and lower sheaths. It creeps under the surface of the ground by subterranean stems or root-stocks from every joint of which roots issue establishing independent plants. Hence it is that any disturbance of the roots during wet weather or when the ground is at all moist serves as much to spread the plant as to suppress it. These root-stocks grow rapidly and persistently, preferring to grow through any permeable obstacle rather than turn aside. The potatoes, A and B (large) are two of many which might have been selected from our last crop through which the underground stems of the Quack had penetrated. It bloomed this year on June 25, and is later than Timothy in ripening its seeds. It varies a geat deal in size and color. In old fields, the heads are no longer than those of wheat, while in hedges or rich land we have seen them, as stated, over a foot in length. There is a tall variety (botanically nemorale) which bears awns, and a dwarf kind which is awnless. This grass is indigenous in the Northwest, and we should be glad to hear from our readers what is thought of it in that part of the country.

TOBACCO-GROWING NOTES.

TOBACCO cases should be made of dry, seasoned pine lumber, an inch in thickness, dressed on both sides. They should be made with hemlock or spruce corner-pieces two by two inches in size. The length of cases should be in accordance with the growth of the leaves to be packed therein. The usual size for the better grades of seed-leaf tobacco is as follows: Length, 3½ feet; width, 2½ feet; and depth, 2½ feet. For extra long wrappers the length should be three feet ten inches, and for fillers or domestic Havana three feet are sufficient. All cases should be carefully weighed and the weights plainly marked upon each end with red chalk or blue pencil.

THE Winter manipulation of tobacco furnishes for the tobacco-grower pleasant employment during the inclement weather, provided he has prepared a convenient and comfortable assorting or stripping room in which to perform the work of stripping, assorting, and packing his crop. Growers should spare no pains to put up their tobacco in the most satisfactory and workmanlike manner, whereby they will gain a reputation for careful handling, which is in itself a profitable attainment for those who intend following the business through coming years. There is as much necessity for care and painstaking in the handling of a crop of tobacco to prepare it for market as in the management of the crop during its season of growth. Carelessness in either case tells severely on the quality of the product and on the profits to the producer.

G. A. G. JR.

An Experiment in Potato Planting.

Last Spring when planting my Beauty of Hebron potatoes, I planted one row through the piece as follows: I took potatoes below medium size, cut off the seed and stem ends, cut out all the eyes but two; planted them and gave them the same care as the rest of the piece. The "seed" for the rest was of the same sized potatoes cut in two and planted one piece in a hill about 18 inches apart in the row. Now for the result: the first row, containing 70 hills, gave 195 pounds; one row by the side of it with 86 hills gave 143 pounds, a difference in yield per hill of over 50 per cent in favor of the whole potatoes with two eyes. This row could be distinguished from the rest as far as the piece could be seen, until the dry weather dried up the vines. The whole piece yielded a splendid crop as did a piece of Snowflake in another part of the field.

Schoharie Co., N. Y. "INCOG"

RED SIBERIAN WHEAT.

WITH this we have had no experience. The heads, one of which has been drawn from life and is here illustrated, were sent to us by Professor Blount, of Colorado. He tells us it came to him from Moscow. When received it was one of the poorest-looking grains he ever saw—shriveled, light, chaffy, dark and soft. The grain and straw grown from it excelled anything he ever raised, the longest head being

RED SIBERIAN—FROM NATURE.—FIG. 524.

7½ inches, the number of kernels 111, and the straw stiff and bright. The heads are smooth, as shown, and the chaff red. It is a Winter wheat. Such fine heads plainly show what a grand field there is for the improvement of wheats. We have faith that our next seed distribution may greatly aid in this direction.

Farm Topics.

THE FARM DIARY.

WALDO F. BROWN.

I believe there are more farmers to-day than at any previous time who desire to be something more than mere "clodhoppers," and who are willing to be at some trouble if thereby they can become better farmers and wiser and happier men. I wish to make a few suggestions to such, pointing out some means by which I have been greatly helped in my own experience. I began keeping a farm diary in 1857, and as I look back over the nearly quarter of a century which has elapsed since I began this work, I cannot point to any one thing which has been so helpful or given such large returns for a small outlay of time and trouble as this has done. The fact that the farmer sits down at his desk every evening to make an entry in his diary begets careful habits and is likely to lead him to keep his accounts more carefully and to keep up a correspondence with absent friends, and I think the practice would pay for these reasons if there were no other. The daily record should be brief, usually three or four lines are all that is needed, but it should include a record of the weather and what is done for the day. If any experiments are attempted on the farm, let them be noted down here, and any event of importance in the neighborhood or that your family are interested in should also be recorded—visits made or received, journeys by any member of the family, sickness, attendance at school, and, in fact, anything which will serve to give a complete history of the family.

If you keep a record of each day's work, you will have, of course, at the end of the year the dates of your planting and harvesting of all crops, both in the garden and on the farm; when the fruit trees blossomed, when the forests were in full leaf, the latest frost of Spring and earliest of Autumn, the time of turning stock to pasture in Spring, the birth of stock, and, in short, memoranda of all the operations of the farm, to which you can turn at any time to ascertain how many weeks it takes a certain crop to mature, to settle definitely the age of an animal, to enable you to determine if it is best to plant a certain crop late in the season, or to fix the disputed date of some event. The last day of each month note the prices of leading farm products. This will become exceedingly valuable when you have kept it for years, and can refer back to it, and it will often help you to determine whether to market a crop as soon as ready or hold for higher prices. You do not want a regular diary with printed headings and an allotted space for each day, for some days a single line about the weather will be all you will want, while occasionally there will be quite a lengthy entry to make.

The weather record can be kept in a single line, except occasionally when there is something so unusual as to require comment. I use abbreviations and make a record of the temperature twice a day, aiming to get the highest and lowest. I hang the thermometer in a northern exposure and where I pass it on my way to the barn, and look every time I pass it, the record for a day reading thus: F. 20°, F. 46°, C. and W., would show the temperature and that the day ended cloudy and windy. The next day as follows: 50°, Lt. R., 60°, var. 54°, F., would show light rain in the morning, variable weather at noon and fair at night. If you prefer, the daily record may be kept with a pencil, but at the end of each year a synopsis of each month should be copied with pen and ink into a separate book prepared for the purpose. This monthly record may be brief, but should give

a condensed history of the month and the prices of farm products should be given here. After this monthly synopsis is made out, while the events of the year are fresh in your mind, write a short history of the season under the following heads: First, Family—Tell here any events of interest which have occurred during the year, such as visits made or received, journeys, health, attendance at school or college, etc., etc. Next, Farm—State how much land you have cultivated in each crop, yield per acre, and when and at what price sold. If your crops have been poor, state the cause, if you know it. If unusually good, say whether it was from extra cultivation or an exceptionally good season. Make a general statement of the weather, as to whether it was wet or dry; Summer cool or hot; Winter mild or otherwise. Third, make a record of any improvements, such as ditching, repairing of, or putting up new, buildings planting fruit or shade trees, building new lines of fence, etc., etc. In addition to this take an inventory of your live stock, and then when the assessor calls on you keep a copy of his inventory and enter it here, and you will have a very fair history of your farm, family and business.

Perhaps it sounds rather formidable to read the directions I have given, but I assure you that an average of two minutes a day will keep the record, and one rainy afternoon or three or four evenings will make out the abstract at the end of the year. I hardly expect to induce a middle-aged farmer to begin such a work; but perhaps some of them will get a son or daughter to do it for them. I do hope, however, that many of our young farmers will begin a farm diary the coming year, and rest assured if they do that they will never regret it.

Pomological

NOTES IN A NORTHERN ORCHARD.

T. H. HOSKINS, M. D.

My orchard is on the shores of Lake Memphremagog, six miles south of the international boundary line, in latitude 45 degrees north, and is elevated 750 feet above the sea level. This territory lies fully open to the sweep of polar waves of low temperature, and there are no Winters in which our thermometers do not frequently register temperatures lower than minus 30 degrees. Fifteen years ago, when I began to plant an orchard, it was believed to be impossible to grow any kind of apples except the Siberian crabs in this section of Vermont and the adjoining parts of Canada. Many thousands of dollars had been expended in vain by our people for the purchase of fruit trees from Southern New England and Central New York. It has been proved at a heavy cost that the standard apples of the great apple regions to the south and west of us cannot be grown here. So far as I am aware no tree of the Baldwin, Rhode Island Greening, or Roxbury Russet ever lived to reach bearing age in Northeastern Vermont. Even such hardy kinds as Westfield Seek-no-Further, Blue Pearmain, Tolman Sweet, Fameuse, and Red Astrachan, succeed only locally and precariously, so that they cannot be grown profitably for market.

The task which I set myself 15 years ago was to test every hardy sort I could hear of and obtain, in order to see whether varieties did exist which could be planted here and in similar exposed localities with security. I have accomplished the work, after testing over 250 varieties, collected from the coldest localities in America. The result is that this part of New England, from having not a single variety of apple (outside of the crabs) which the people had confidence to plant, is now rapidly becoming a region of orchards, unsurpassed in any part of the country for vigor or fruitfulness.

The past season our orchards have fruited abundantly, and many of the newer sorts have shown decidedly, for the first time, what they could do. During successive previous seasons other kinds have been undergoing test and judgment, and I believe a few notes on some of them will prove useful to fruit-growers who read the RURAL, and especially to the many of them who inhabit the "cold belt" which extends from Dakota through Minnesota, Wisconsin, Northern Ontario, Quebec, Northern Vermont, New Hampshire, Maine and New Brunswick.

TOO TENDER.

In the first place, I will give a mere list of the varieties which have been utterly "wiped out" by Jack Frost. These embrace the William's Favorite, Yellow Bellflower, Black Oxford, American Summer Pearmain, Red Canada (not a Canada apple, notwithstanding its name), Morgan Sweet, McClellan, Grimes's Golden, Gravenstein, Granite Beauty, Fairbanks, Ramsdell Sweet, Canada Reinette (not grown in Lower Canada to any exten-

QUACK, COUCH OR QUITCH GRASS.—From Life. See 1st page.—Fig. 525.

Franklin Sweet, Fall Orange, Summer Hagloe, Colvert, Munson Sweet, Golden Sweet, Jewett's Fine Red, Fall Pippin, Moses Wood, Minkler, Mamie Cathead, Cooper's Market, Yellow Ingestrie, Whitney Russet, besides quite a number not "in the books." It will be noticed that there are many sweet apples in this list. My experience is that, as a rule, this class of apples is more tender than others. There are very few to be found in the Province of Quebec, so few, indeed, that the people have no taste for them, and they are not salable in the markets of the large towns. Now come the

"ALMOST HARDY,"

the most vexatious of all, because they neither thrive nor die. Some of them, indeed, do tolerably in favored spots, but none will do to plant extensively with a view to profit.

ST. LAWRENCE—Around the city of Montreal and on the hills which rise out of the flat country between Lake Champlain and the St. Lawrence River, this beautiful and excellent Fall apple is productive and profitable. It is doubtless a Fameuse seedling (as so many of the Lower Canada apples are), having a similar flavor and the same snowy-white flesh. Very few of these Fameuse seedlings do well in the more elevated country. Both parent and progeny develop the vice—inherent in them, but little seen under the more favorable conditions—of spotting, and to this the St. Lawrence adds cracking and shy bearing, together with some tenderness of tree. Not profitable here.

RED ASTRACHAN. — Tree tender; fruit smaller and less fair than in more favorable places. Not profitable.

FAMEUSE.—Bears young and well, but the fruit is not so large or so fair as at Montreal and the Champlain Valley, and the tree is plainly tender. Profitable, yet not safe to plant extensively.

BEN DAVIS.—Tree tender and short-lived; fruit hardly "good" elsewhere and no better here. Though a free bearer, not profitable.

POMME GRISE.—Tree tender, fruit small and knurly; not profitable, though the quality is fine.

NORTHERN SPY.—In protected spots this noble variety sometimes succeeds here as well as anywhere in the country. Our Spys took the first premium at the State fair this Fall. Nevertheless the tree is too tender for us.

RIBSTON PIPPIN.—Living at a poor, dying rate, it still bears well and bears fine fruit; but after a few years' struggle gives up the ghost.

FALL WINESAP OF THE WEST.—A good little apple, just now (November) in eating, but the tree is not hardier than Ben Davis, and is not productive.

SAXTON STRIPE.—A fine-flavored October apple; tree productive, but tender, and soon falls into a decline ending in death.

EARLY JOE.—Struggles along and bears some fruit, but survives only in an unhealthy state.

JONATHAN.—In the same category with Early Joe—the more's the pity.

SOPS OF WINE.—The most successful of those not entirely so. The tree suffers from the Winter, yet bears good crops and seems to get hardier with age.

TOLMAN SWEET.—This variety grows thriftily and bears well, and one would not for several years suspect it of wanting hardiness; but when it comes to full bearing, unless carefully propped up, it breaks down all round, and the breaks invariably reveal a rotten interior, with only a skin of healthy wood. Sorry to have to give up this excellent Winter sweet. These two lists of complete and partial failures might be considerably prolonged did space permit. I have given only the varieties best known and likely to be tried by others similarly situated.

HARDY AND GOOD.

The more pleasant list of kinds that have proved successful in point of hardiness and quality of fruit embraces also a considerable number of varieties. From these I select the best of those which add productiveness and general thrift to the first-named qualities, as follows:—

TETOFSKY.—With all the merits this apple has the fault of dropping a considerable part of its crop before it is ripe. Not recommended for market on that account.

YELLOW TRANSPARENT.—Of the same season (August) as Tetofsky, beautiful, very good, exceedingly productive, does not drop. Transports well for a Summer apple.

DUCHESS OF OLDENBURGH.—It is hardly necessary to praise this large, early-bearing, handsome and heavy-bearing September apple. Its only moderate quality is its sole defect, yet no apple of its season is more marketable or more profitable. It can be grown much more cheaply than potatoes, and never brings so low a price here. Still it is possible to have too many of an early apple, unless you are prepared to evaporate them.

WEALTHY.—This is the king of all the hardy apples. As productive, hardy, early-bearing, large and beautiful as the Duchess, it, in this region, keeps well until March, and outsells Baldwin or any apple brought here from the South.

MAGOG RED STREAK.—If it were not for the Wealthy this would stand at the head of our Winter apples. It is large, handsome and a good keeper until April. The tree is hardy, thrifty and a profuse bearer, but the fruit has too little red to compete with the splendid Wealthy as a market apple. And yet it is styled, in the report of the Iowa Horticultural Society, "the beautiful Magog Red Streak."

SCOTT'S WINTER.—This is the apple which well replaces, for us, the Roxbury Russet of a milder climate. It is of medium size, heavily striped and sometimes covered with red. It is "hard as a rock" until April—sour, and only useful for cooking. As the warmth of Spring begins to reach it, it mellows, becomes mild, aromatic and far better in quality for dessert than the Roxbury Russet. The tree is a true "iron-clad," a profuse bearer on alternate years, with a good crop in intermediate seasons. In my orchard of 1,400 trees the Wealthy and Scott head the list—400 of each. The Scott keeps well into July, and not only keeps, but keeps fresh and crisp, with almost no loss, when properly handled and stored.

Did not the reasonable limits of such an article forbid, I might enlarge this list with some excellent amateur sorts. But many of these have been separately described and illustrated in the columns of the RURAL during the past four years, and in time others may be added.

Newport, Vt.

A Plea for the Commercial Union of Canada and the United States.

In the shipping of Fameuse from Canada this season there has been a new departure consequent on the scarcity of apples throughout the United States. Dealers have been through all the apple sections buying up for the markets of the principal Northern cities, some being even sent as far south as Baltimore. Fifty barrels of our own apples were sent to New York and brought at wholesale four dollars per barrel. But the duty is heavy and causes shippers to be shy of forwarding. It is too bad that these two countries cannot agree toward their mutual good in matters of commerce. The Fameuse is the finest table apple the continent produces, and would supersede the Lady Apple if it could be exported, as nowhere does it grow in better quality than in the Province of Quebec, where many other apples do not succeed. It is in the cities of the Union our market should be for this fine fruit, and but for the duties its superior quality would always ensure remunerative prices. ANNIE L. JACK.

Horticultural.

RURALISMS.

I HEARTILY reciprocate Mr. Parnell's kind wishes. I should be right glad to take him by the hand and leave the "swords" to those who make the beautiful desolate, while we seek to make the desolate beautiful and fruitful, "which is far better,"

IT does seem a little odd to speak of slate and shingles as mulching materials. I will explain. Years ago, when the astonishing vegetable growth of California was a new wonder, she sent us, among other things, some large British Queen Strawberries, one of which measured 8½ inches in circumference, which at that time was remarkable, and furnished the press with not a little material for comment. The British Queen was at that time our "big" strawberry, and was much grown. The late Mr. Gustin, Mr. Boyden, myself and a few others tried to beat this big Queen. Mr. G. reached very nearly 8½, I reached 8¼, but the size of the others I cannot remember. Here is where the slate and shingles come in, for I used them to cover my strawberry bed. Experience had taught me that uniform moisture was indispensable to the production of large strawberries, and it occurred to me that slate was just the thing for my purpose, and better than litter (perhaps because they happened to be at hand). I had an opening two by four inches cut on one side of each slate, which enabled me to push two slates up to each plant, with an opening of four by four inches in the middle for the plant. This answered all the purposes of a mulch by keeping the soil moist and preventing the growth of weeds, besides materially aiding the ripening of the fruit and keeping it clean. I use shingles and tin in the same way. The other parties depended upon copious waterings and

thinnings out of the fruit. I used no water and did not thin out. I was beaten a trifle on the single berry, but I had much the largest crop of fruit. It was a very pleasant excitement while it lasted. I have used this kind of mulch more or less ever since, and alluded to it because a year or so since a clay disk with a hole in the middle was patented for the same purpose, and is really not so good because of its bevel form, besides that it is much dearer. My 12-inch Lincoln and nine-inch Sharpless were raised with shingles, an objection to which is that some kinds warp badly. This kind of mulch is well adapted for the garden. I hope this explanation will prove acceptable to Mr. Parnell.

IN regard to the Caroline Raspberry, I have tried it so thoroughly that I do not hesitate to recommend it as one of the best of raspberries. When the berry begins to color it is a pale yellow, which turns to a pretty salmon color when ripe. Among berries of its color it is equalled by none except the Brinckle, and it is but little inferior to that old standard when ripe. It is thoroughly hardy, a very strong grower and immensely productive. Its ability to bear long carriage has yet to be proved, but for a near market its value is already established. The amateur, at least, should accept the Caroline as a boon.

I FEAR it is a mistake to recommend keeping the crocus out of the ground till Spring (p. 743). No amount of cold will kill it, and it will be found very difficult to keep the bulbs sound during the Winter. I never could do it. Besides, the crocus should be cheering us with its modest but pretty flowers long before the ground is fit to dig in the Spring. Planted at the foot of a wall, I have had them push their flowers through two inches of snow. Last Spring they were covered with four or five inches of snow when in bloom, and came out unharmed. I should recommend planting them in the Fall about three inches deep, and let them remain undisturbed for two or three years. I have not disturbed mine for the past four years. I do not replant them till they have worked their way almost to the surface. The improved named kinds are to be preferred. The oxalis should be potted now. O. Bowiei has been in flower for several weeks.

OF all the grasses none responded so quickly to the beautiful rain as the Blue Grass (Poa pratensis). The farmers, however, too generally made a mistake in allowing their cattle to run in pasture lots to eat off and trample down the young growth before it was an inch high. This is what I call an unwise economy. After such a long drought pasture lots should have had a chance to recover from its effects. Late-sown rye has grown wonderfully. The recuperative powers of nature are remarkable, and beyond ordinary comprehension.

WHEN the long-prayed-for rain came it was a warm one, and thus in the first week in November the edible mushroom (Agaricus campestris) sprang up in old pasture lots and by the wayside in such quantities as I have never seen before. It was hardly possible, in some lots, to take a step without treading on them. The great, fat, white buttons set some people almost crazy with delight. Large quantities were boxed for market

HORTICOLA.

French Argenteuil and Giant Dutch Asparagus.

I planted the RURAL seeds of these two varieties very carefully last Spring and gave them as good a start as possible. Alongside of them I planted common seed gathered from one of my neighbor's plots the Fall before. A few days ago I was making a new bed to transplant them all. The roots of those received from the RURAL were especially fine. I gave them a plot that had been manured in the Spring with fresh stable manure; then in August a heavy dressing of well rotted bagasse was applied; then just before transplanting another heavy dressing of stable manure was put on and well spaded in, and the plants set in drills two feet apart one way and one the other. The universal and severe drought we had this Summer was very hard on all kinds of vegetables, but the asparagus seemed to grow right along. I shall give it a fair test along with the common, giving as nearly as possible the same treatment, as I regard this as the only true way of deciding how much better new varieties are than the old ones. So far as one year's growth of stalks and roots is concerned, the seed obtained from the RURAL proved decidedly the best. Another year will fully determine which is most desirable.

N. J. SHEPHERD.

The Vineyard.

MINER'S SEEDLING GRAPES.

In a recent number of the RURAL a correspondent inquired touching the grapes of the late T. B. Miner, of Linden, N. J. I have fruited several of them the past season when so few grapes ripened here, and the following named varieties all ripened their fruit perfectly: Antoinette, Adeline, Augusta, Belinda, Carlotta, Victoria, Lexington and Linden (the two last black grapes). The distinction between the white grapes is not great. They are all sweet, delicious. Their time of ripening varies and they vary in size and shape of bunch. My vines are not old enough yet to venture a special description. They all hold to the bunch for a long time tenaciously. Taking the Miner grapes together, I consider them the best collection of hardy, early, outdoor grapes in the market, and I have nearly all the leading varieties known.

This note is long and may seem to savor of unnecessary praise; but it is due to the widow of Mr. Miner, whose husband, with consummate care and patience has added so many valuable grapes to those in our market, and Mrs. Miner is entitled to the benefit, if any ensue. I first saw her advertisement in the RURAL. She sends out the best grown vines, differing in this respect from many dealers, so I wish to say a good word for her.

Mattapan, Mass. J. C.

Arboricultural.

ABOUT TREES.

Arbor-vitæ hedges in the neighborhood of Philadelphia are in some localities being totally destroyed by the "basket worm," which infests them in countless numbers.

"What will the harvest be" from the prevailing mania for planting simply shade and ornamental trees on small estates of from one to three acres? Where are to be the nutting grounds for the boys and girls of the future who are so unfortunate as to live in those thickly-settled portions of the country where the habits of suburban life abound? Granting the utility of ornamentation, what tree is more ornamental than the chestnut? The butternut, shell-bark and walnut have also a place as ornamental figures, and why either or any of them should be excluded from lawn and road-side planting is, in a way, incomprehensible. The oak, which is of slower growth than either, is not overlooked, and ought not to be, as it is, all in all, the handsomest of trees. Mulberry trees are very fine, while the fruit is greatly liked by many people. Certain sorts of apple trees are extremely picturesque, and when in full bloom, and again when in fruit, are lovely to see. Why exclude the mulberry and apple for the sake of the maple? And why not plant the road-sides with trees that bear the double blessing of fruit and shade? School children might be led to plant trees along the highways and become so identified with road-side orchards of fruit or nuts as never to lose interest in that sort of public philanthropy, while in after years it would be a source of pride and pleasure to them to mark the results of their early efforts as tree planters.

MARY WAGER-FISHER.

The Herdsman.

NOTES BY A STOCKMAN.

THE Governor of Illinois has put himself in a false position by issuing a proclamation which is dated Nov. 1, forbidding under severe penalties the importation of cattle into Illinois from certain counties in Connecticut, New York, Pennsylvania, New Jersey, Delaware and Maryland, after the 10th day of November, unless accompanied by a certificate of health properly signed by a duly authorized veterinary inspector.

THE Governor of Illinois, or rather the Legislature of that State, has undertaken, by its act of May 1881 by which this proclamation of the Governor was authorized, to regulate commerce between the States; and this is a function belonging solely to the National Government. Several Western States some years ago tried to prevent Texan cattle from being brought into their territory by passing prohibitory laws, but these were overruled by the U. S. Supreme Court as in conflict with the Constitution of the United States.

ONE of the counties scheduled is the place of my residence, and I know my county is free from pleuro-pneumonia, and the inspectors have found their occupation gone. With a large acquaintance among stock owners I have not heard of a case for three years past, and the traffic in stock is perfectly free from interference within the State. Not long ago the English Government did the same sort of a thing and the Western men did not rest until the U. S. Government interfered and exerted all its influence for their relief. They were quite ready to declare then that there was no pleuro-pneumonia in the United States in an epidemic form and now the Governor of Illinois declares there is a good deal of it.

THERE is a glaring inconsistency about this business.

THE coming boom in cattle is going to be in favor of the polled breeds. There is a good deal of ignorance in regard to these cattle. The Polled Angus is undoubtedly an excellent race for beeves and in places will compete favorably with the Short-horns and Herefords. Doubtless they may be more conveniently handled than the horned beasts, but it is an exaggeration to say more can be safely crowded in a car of the polled cattle than of the horned ones. There is a limit to the crowding of beasts in a car and some room for breathing is required. Practically the room gained about the heads of the poor beasts by their horns is all the breathing room they have, and if a lot of polled beeves become crowded in the cars some would be suffocated for want of air.

THE common opinion that polled cattle are entirely inoffensive is a great mistake. I have seen a man very quickly lifted over a fence by a polled cow and these beasts will push and strike with their heads in the manner of other cattle, quite as savagely. The proportion of cross or savage cattle will be found quite as great among the polls as among the horned. Let us have the truth anyhow, and give the polled cattle their due; but at the same time don't let us deceive ourselves. In the dairy these cattle will never be popular, and simply because they are not so profitable as the Jerseys, the Ayrshires, the Dutch, the Short-horns or good average natives, that is, considering the market value of these last.

BOOMS are something like boomerangs—they hit back every time. When a boom is coming sensible people should keep out of the way of it, or they may get hurt.

THE Short-horn breeders' convention recently held at Jacksonville, Ill., took some practical steps to secure control of the Herd Books by the National Short-horn Association. A capital of $50,000 is to be subscribed chiefly for the purpose of securing these books and of consolidating them into one under the immediate control of the breeders. This has been done in England and will be done here no doubt. It is naturally to be expected the breeders should wish to have the expense of recording their animals reduced as much as possible and object to be taxed by a private individual for his own profit any longer than they can avoid it. The breeders now have the power in their own hands and they will undoubtedly soon own their own Herd Book by one method or another.

"PINK EYE" is the popular name for an epizootic disease among horses which has been quite prevalent in Ohio and Western Pennsylvania. It is really a species of influenza in which all the symptoms which characterize this disease in the human subject are present. Languor, disinclination for exertion, head-ache, weeping from the eyes, redness of the conjunctiva, puffy eyelids, discharge from the nostrils and swelling of the legs, with much general fever, comprise the symptoms. There is no trouble with the lungs nor any cough, as in the aggravated or pulmonary influenza.

THIS disease lasts from three to ten days and with good nursing and rest disappears without any secondary complications. It fortunately spreads slowly and does not make a general onslaught upon the horses of a locality at a sudden swoop. One is taken, then another and another; and meanwhile the first is recovering. The horses in Cincinnati have suffered in this way very generally but without any particular inconvenience. A liberal dose of salts and warm gruels and warm blanketing with rest will soon bring a sick animal through his trouble.

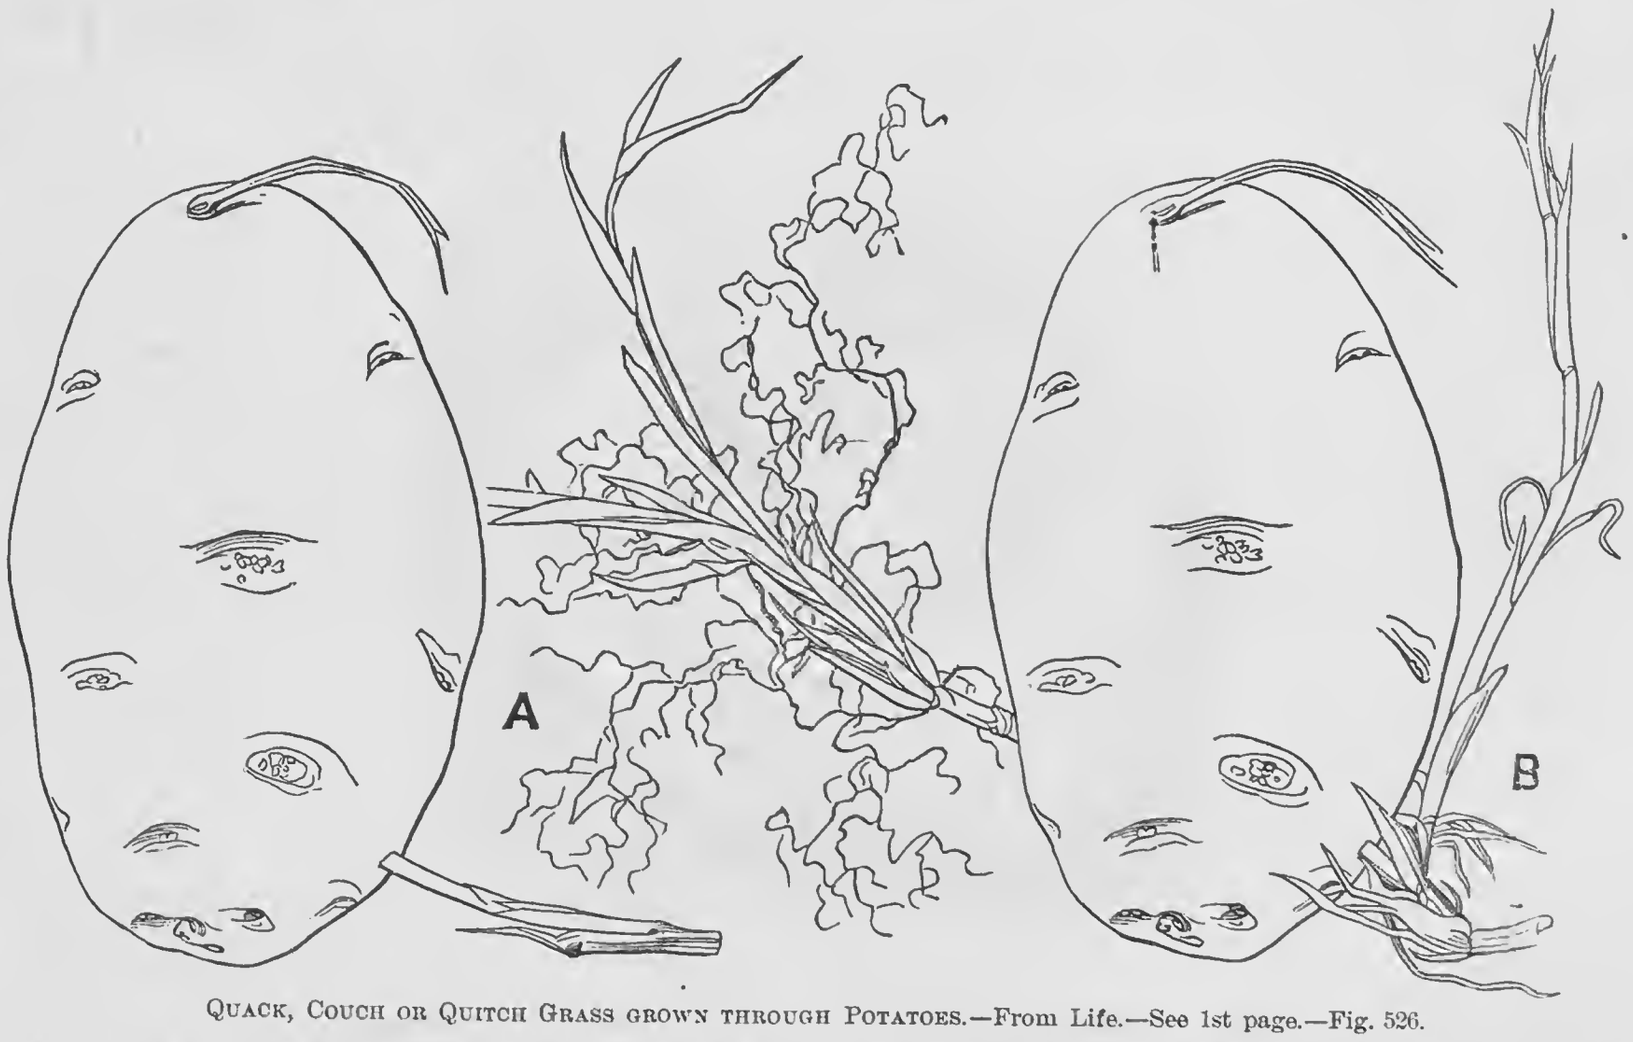
WINTER STOCK FEEDING

PROF. E. W. STEWART.

IN my first article, in the RURAL of October 15, I made suggestions applicable to the contingency forced upon farmers by the drought and some of the ways of getting through the Fall with cattle in unabated growth. We have now to consider some of the plans that may be adopted for winter-feeding. And first let us consider

ECONOMY IN FEEDING.

In the cold season our animals must be kept warm. That can be done, first, by putting them into a stable the temperature of which



QUACK, COUCH OR QUITCH GRASS GROWN THROUGH POTATOES.—From Life.—See 1st page.—Fig. 526.

never goes much below 50 deg., or, better still, if kept pretty evenly at 55 degrees, or a little more than 10 degrees below Summer temperature—when the food consumed to keep up animal heat will be reduced to a minimum for Winter. But if the stable boarding is full of broad cracks, giving only about the same protection from cold winds as a high board fence, allowing the manure to freeze solidly—then all the heat carried off by these numerous currents of cold air must be balanced by chemically burning just so much more food in the stomach. This is an extravagant way to produce the warmth which a good stable will furnish. Food is an expensive fuel. But some of our Western feeders think that *corn is cheaper than shelter*. Yet I think a few years of high prices for corn, like the present, will soon lead them to doubt this philosophy. When corn is only worth 15 cents a bushel it may, perhaps, come into competition with anthracite coal at $8 and $10 per ton, but not at 50 to 60 cents per bushel. But these feeders do not consider the whole case. Food is not given to growing or fattening animals simply to keep them warm and in their present condition, but also to make them grow and lay on flesh and fat, and increase in weight and value. From this increase must come all the possible profit. Yet in very severe Winter weather the best feeders under this system can only make the cattle hold their own. All the corn they can consume goes to furnish fuel and to supply waste of the system, and therefore this heavy feeding is lost—no profitable result comes from it. In mild Winters fair progress may be made in the open air with heavy feeding, but February and March often swallow up all the progress or profit made in December and January, and that must be called a very poor system which is liable to prove unprofitable oftener than successful. Time must work a revolution in Western Winter feeding, as two bushels of corn are required to produce the same result as one in a good system of Eastern barn feeding. Can the feeder afford to double the amount of food to save the expense of good shelter—good stables? Warm and permanent stables may be built almost anywhere for $10 per head of cattle protected. The interest on this investment would be 60 cents per head per year. Can all this extra corn be furnished for 60 cents?

Some of the best Western feeders on a large scale, prominent among them Mr. Gillett, of Illinois, wisely do their principal feeding in warm weather. In Mr. Gillett's magnificent Blue Grass pastures will be found, placed at short intervals, troughs of abundant corn, which is eaten *ad libitum* by the steers, so that they are ready for shipment in the Fall, or, if kept into Winter, are in such superb condition that the weather has less apparent effect upon them. This plan assists in disguising the losses of open-air feeding in Winter. Barn-feeding has never had a fair trial in the West because the cattle are there so unaccustomed to handling and restraint that when put in a barn they chafe under confinement so much as to neutralize all the benefits of warm shelter. They must be brought up to barn-feeding and handling from calf-hood before the benefits of good shelter can be appreciated.

REPAIRING COLD BARNS.

Great improvements may be made in cold barns at very little expense. The part devoted to the stable may be furred out on the inside with inch-and-a-half by four-inch stuff, and then boarded horizontally on the furrings. This will leave a space of four inches between the boardings, to be filled with sawdust, tan-bark, shavings or cut straw, well rammed in. Inclose a cold stable in this way on the inside and it will make it very comfortable for cattle in the coldest weather. This will cost the farmer much less than its advantages for a single Winter. This is one of the first economies to be considered and adopted.

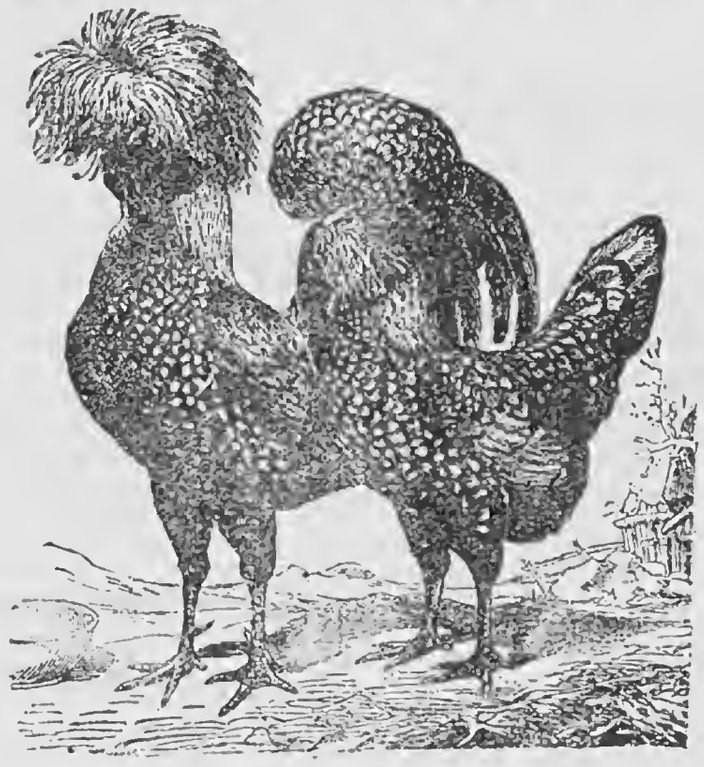
FEEDING STRAW, ETC.

In many parts of the country the hay crop was under an average, and then the drought drew upon this stock of hay, making the Winter supply still less. It will therefore be necessary to study the use of all the accessory fodders, such as the different kinds of straw, corn fodder, etc. Many people think straw has no feeding value except to give bulk in the stomach, etc. Let us see what chemistry says on this point. We will find how they compare with hay in the German experiments. And as this journal circulates over such a wide territory, I will give a pretty full list of straws, so as to be adapted to all parts of the country. I give only the proportion of digestible matter as found by actual experiment, giving meadow hay and clover for comparison:—

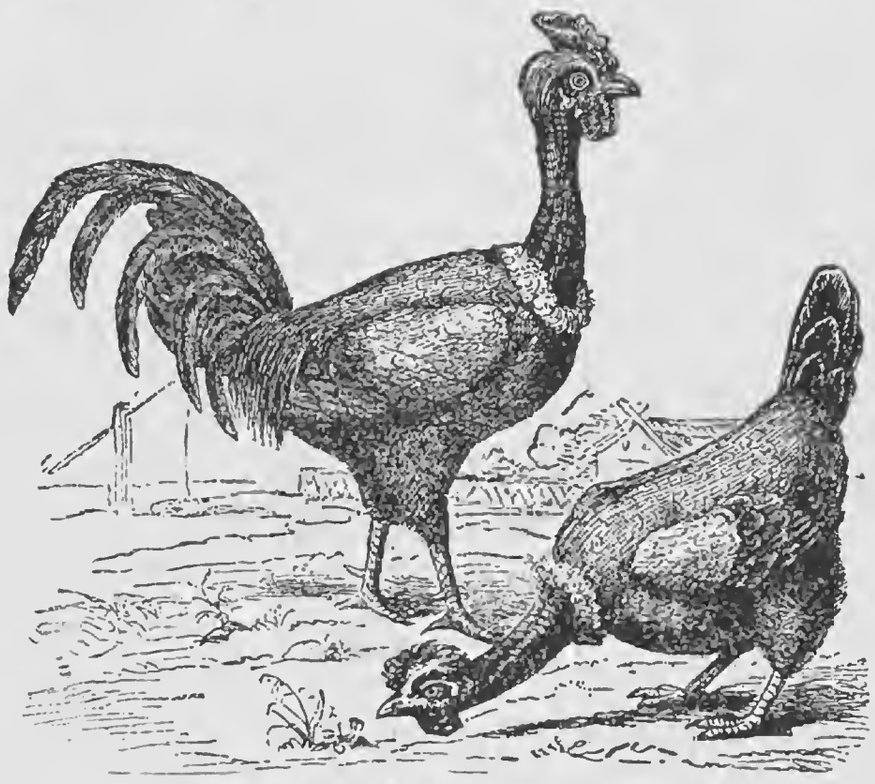
	Digestible nutrients.				Nutritive Ratio.	Compared with meadow hay. $
	Albuminoids.	Carbohydrates.	Fat.			
Meadow hay medium	9.5	41.0	1.0		8.0	1.00
Red clover hay "	7.0	38.1	1.2		5.9	1.08
New process linseed meal	27.	33.9	2.1		1.4	2.51
Cotton seed meal (decorticated)	33.2	17.6	16.2		1.8	3.60
Malt sprouts	20.6	43.7	0.9		2.2	2.08
Corn meal	8.4	60.6	4.3		8.6	1.73
Winter wheat straw	0.8	35.6	0.4		45.8	0.57
Winter rye "	0.8	36.5	0.4		46.9	0.55
Barley "	1.3	40.6	0.5		32.2	0.68
Oat "	1.4	49.1	0.6		29.9	0.69
Pea "	2.9	33.4	0.5		12 0	0.69
Bean "	5.0	35.2	0.5		7.5	0.86
Seed clover "	4.2	28.5	1.0		7 4	0.75
Corn stalks	1.1	47.0	0.3		31.4	0.61
Nicely-cured corn fodder	3.2	43.4	1.0		14.4	0.91
Corn-cobs	0.6	41.7	0.4		71.2	0.64
Salt marsh hay, good	3.7	38.4	0.9		11.1	0.84
Coarse salt grass	2.5	36.3	0.7		15.0	0.74
Fresh marsh hay, cut in June	4.5	38.4	0.6		8.9	0.90
" " " " " August	3.4	40.0	0.7		12.4	0.84

To those who have not studied the comparative value of grain with hay the above table will teach much. It shows that the poorest straw, Winter rye, is worth 55-100 as much as good meadow hay, and barley and oat straw 68-100 and 69-100, or more than two-thirds as much as hay. But all the straws, except pea and bean straw, are very poor in muscle-forming matter; but they all have a fair amount of digestible carbohydrates, or heat-and-fat-forming food. The skillful feeder must, therefore, combine other foods rich in albuminoids with straw, and thus balance the constituents in the mixed food. The nutritive ratio of Winter wheat straw, it will be seen, is very wide—1: 45.8—whilst for feeding growing stock, or fattening stock, it should be as narrow as 1: 6. If we make a ration of 15 pounds of Winter wheat straw, five pounds of clover hay, four pounds of corn meal and four pounds of new-process linseed meal, the nutritive ratio will be 1: 6, and young cattle may be grown rapidly or cattle be fattened upon it. By giving straw—all they will eat, say 20 pounds—with the linseed meal and corn meal, the same as above, cattle will keep in good condition and make a moderate growth; the nutritive ration will be 1: 7.18, or better than meadow hay, and the animal will do better than upon good hay. This grain food will cost in most places 10 cents per day, but not more than seven to eight cents in ordinary years; whilst 25 pounds of hay, at $12 per ton, would cost 15 cents per day, and produce a much less favorable result in feeding, showing that hay is dearer at $12 per ton than new-process linseed meal at $25 per ton, and if the reader will turn to the table he will find it estimated at 2½ times the feeding value of hay.

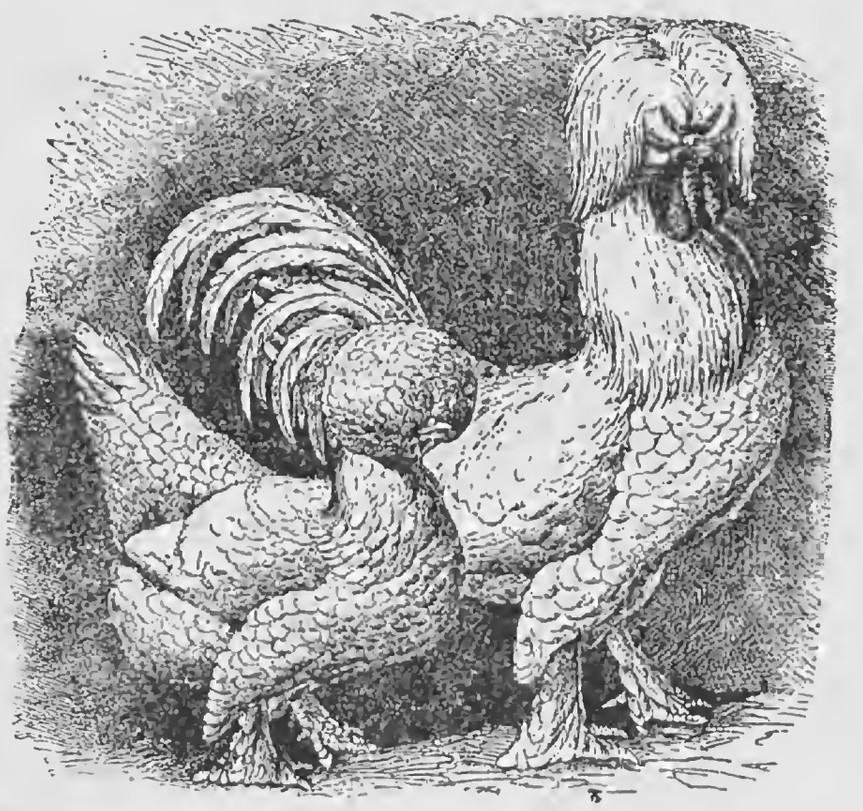
This table is intended to be supplementary to the table on page 699, and if the reader will turn back to the latter he will find most of the refuse grain foods explained, which can be used to feed with different kinds of straw. A great number of rations may be made up with straw and the different kinds of bran. It costs much less, when the farmer has straw to make up the deficiency, by buying wheat bran, rye bran, buckwheat bran, pea-meal bran, or the different grains, and feeding any or several of these with straw, instead of buying hay, the market price of hay generally being higher than that of these grain foods, according to the real feeding value. Straw has so considerable a feeding value that the farmer should always make the best use of it by feeding it all to his stock. The manure made from straw by passing it through cattle is not to any material extent reduced in value over that trod down in the yard; for the principal part digested by the cattle consists in carbohydrates, which have no manurial value, as, if these were burned, no ash would be left. Straw has an important quality of furnishing carbohydrates to keep cattle warm, and the nutriment is sought in the other foods fed with it. Those foods rich in albuminoids and in mineral elements also produce the most valuable manure, so that the farmer who feeds bran, new-process linseed meal, cotton-seed meal and such kinds of food, gets back a large part of their cost in the enriched manure.



GOLDEN-SPOTTED PADUAS.—FIG. 527.



TRANSYLVANIAN BARE NECKED FOWLS.—FIG. 528.



SULTAN FOWLS.—FIG. 529.

CORN FODDER.

It will be seen by our table that ordinary corn-stalks are not as good as barley or oat straw, yet a ration made of these and a small amount of corn is generally considered adequate to the wants of cattle. Indian corn, as will be seen by the table, is quite too poor in albuminoids to be used wholly to make up the deficiency of corn-stalks. Suppose 20 pounds of corn-stalks are fed with eight pounds of corn meal, it would only give 89-100 of a pound of albuminoids; 12.24 pounds of carbohydrates and 40-100 pound of fat. This is quite inadequate in muscle-forming matter. But if four pounds of cotton-seed meal be substituted for four pounds of the corn meal, it will make a better balanced ration. Such poor fodder must be balanced by food very rich in albuminoids, and those most usually found in market are linseed meal, cotton-seed meal, malt sprouts and the various kinds of bran.

If we take nicely-cured corn fodder, cut when it first tassels—the case given in the table was a sample of fodder corn raised by Mr. Webb, of Connecticut, and analyzed at the Connecticut Experiment Station—we find it very much better than common corn-stalks. If we take 25 pounds of such cured corn fodder and feed with it four pounds of linseed meal, the ration will have a nutritive ratio of 1: 6—a very good ration for wintering stock—or five pounds of wheat bran may be fed instead of the linseed meal. This will bring stock through the Winter better than hay.

By examining our tables the reader will see how he may feed all kinds of straw, marsh hay, in fact, all kinds of farm refuse, by judiciously mixing in a little grain. Farmers should not sell off the regular amount of stock their farms can keep, because they happen in a year like this to be short of hay. Sales, under such circumstances, must be made at a low figure, and, if they will purchase some of the foods mentioned in the table, and feed upon their course fodder, they will find their stock to come through the Winter in such fine condition that they will be well compensated for the outlay. I must not omit to say that a good cutter ought to be found on every considerable stock farm. Straw, corn fodder and poor hay are much increased in value by running through the cutter. In this condition, the ground linseed meal, cotton-seed meal, and all the various kinds of bran, can be mixed with the short-cut fodder, and the meal and straw or the fodder must be eaten together and all raised and re-masticated together—thus greatly aiding digestion.

The Poultry Yard.

SOME STRANGE BIRDS.

It should be gratifying to our poultry fanciers to know that there are yet other worlds to conquer and that the American Standard may in time enlarge its borders and its bounds and take in some strangers as yet unknown to the American public. Every new accession to the ranks of the fancy poultry should have some distinguishing and valuable characteristic; otherwise it is not deserving of notice. One of the most remarkable of fowls, which I beg leave to introduce to notice, has a peculiarity differing from any other known breed. We have fat and fleshy fowls, some with plump breasts, some with long shanks, and some with rotund rumps, and some again are made up inside wholly of eggs. But there is a fowl that is said to possess all these qualifications, with one more that is as valuable as all these together, viz., in that it offers to the smiter a neck already bare of feathers all ready to be twisted or to be amputated at a blow. This is the Transylvanian fowl of which the accompanying portraits are taken from the new German Illustrated Hand Book on Poultry Farming. How thoughtful is nature and how the fowl is evoluting towards the bare possibility of an entirely featherless bird that is always ready plucked for the pot. The specimen before us certainly seems an approach in this direction.

As a contrast to this ungainly bird may be mentioned the Sultan fowls which are nearly all feathers and in which the plumage boils over, as it were, at every extremity. Its toes and legs are feathered profusely; the head is a complete ball of feathers and the tail hasn't

room for another plume. Look at the two. The one looks like a tramp carrying as few clothes as can be hung about the limbs so that one may say they are not exactly bare, and the other is dressed out with all the excess of one of the votaries of fashion.

Then there are the gold-spotted Padua fowls of brilliant and graceful plumage and these too seem to be in a state of eruption about the head, and thus offer a striking contrast to the Transylvanian tramps.

The Transylvanian fowls are an example of modest merit. "Neat but not gaudy" in style and with nothing in outward show to strike the fancy, yet they have the excellent points of easy and rapid fattening and prolific production of eggs. With this, as I have before said, they offer a bared neck to the executioner and so much work is saved to the dresser. Like the bare-backed young Brahmas, this bare-necked Transylvanian thrives well in the coldest weather, is a moderate eater and the hens are the best of mothers. What more can be desired of a fowl except it be feathers? And these we have in the Sultan. This bird is wholly white with a delicate, creamy shade. A few of these birds were shown at the Centennial where the owner assured me, with a most solemn countenance, that he had his birds direct from the Sultan's harem, and that they were the only birds of the kind in America. This bird, like some other handsome creatures, is good for very little except good looks, is very tender, a very careless mother, and I must say that the specimens I saw at Philadelphia did not come up by any means to the style of the illustration given in the work from which it is borrowed.

The Padua fowls have value as well as beauty. They bear confinement very well, and can be kept cooped up without trouble. They are a popular fancy fowl and are kept as ornamental pets; they lay moderately well and make fair table fowls. I do not know that there are any of these fowls in the country, and if there are not some of the fancy poultry farmers will thank me for calling attention to them. X. U. P.

Dairy Husbandry.

PLAN FOR ICE-HOUSE AND CREAMERY.

In considering the cooling effect of ice it must he remembered that the low temperature is only gained by the expenditure of the ice and that it is a question if it is better to make use of an ice-house constructed in the most economical manner, or to so use the ice as to procure a continuous low temperature with the certain large waste of ice that would be inevitable. As a general principle waste s a loss although the thing wasted is cheap. Ice may be procured, perhaps, by the expenditure of some labor only, but no reasonable person desires to expend his labor for that which profits not. But the ice-house costs money and to store ice which is to be wasted for no good purpose is by no means advisable.

There may be some cases, however, in which the case of operating a cooling apparatus may be more convenient, although it may consume more ice, than to handle blocks of ice in carrying them from the ice-house to the creamery for use. Where ice is abundant this view of the question may be reasonably considered. A point that bears strongly upon it is that the ice may be stored in the Winter when the labor may cost comparatively nothing, because there is plenty of time and opportunity for the work, and in Summer time is more valuable and business presses closely upon opportunities, so that the handling of the ice in the Summer would, in fact, be more irksome and costly than the waste involved. For to open the ice-house, take out the blocks required, carry them to the creamery, wash from them the sawdust or other packing and dispose of them as may be required, is, we know from experience, work which occupies considerable time, when time is scarcely to be spared from other pressing duties. The good manager will aim to distribute his work so that it may be done in the easiest manner consistent with the best results, and as time is money, time gained when it is worth the most money, is equivalent to three or four times as much expended when it is very cheap. We will give a plan that will be suitable for each method, leaving those interested to choose between them.

A self-acting ice-house may be constructed in the usual manner, but requires the addition of ventilating tubes through which cold air may be brought into the cooling room; and drainage pipes by which the water produced by the necessary melting of the ice may be drawn off from the bottom into a cold pool where it may be utilized to the best advantage. A horizontal section through an ice-house of this kind is given at Fig. 530. Here the ice-house adjoining the creamery is shown. Through the body of the ice are four zinc or galvanized iron pipes or tubes having a number of holes bored through the covering at the top to admit the air. The spiral galvanized water spouting for buildings serves excellently for this purpose. These pipes are brought along the bottom, as shown at Fig. 531, which is an upright section, and open

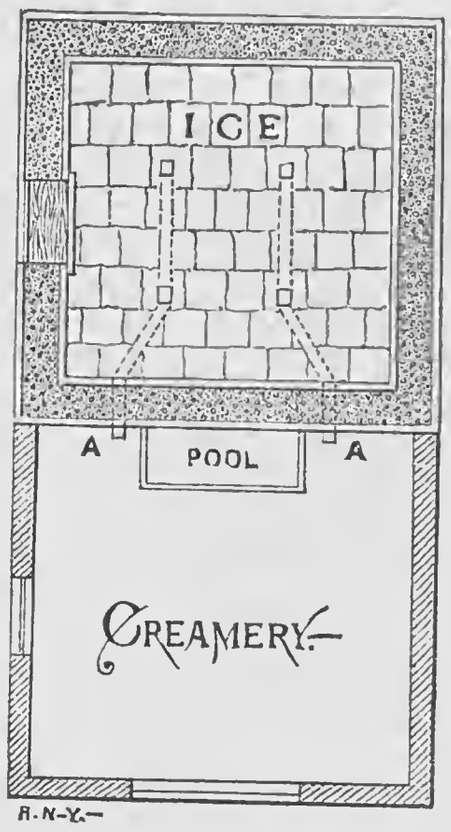


FIG. 530.

into the creamery on each side of the cold pool. The current of air which passes through these pipes, of course melts and uses up the ice and causes a quantity of cold water to be produced which must be drawn off, or the whole body of ice would rapidly waste. The floor of the ice-house is made to slope a little from each side to the center and the center

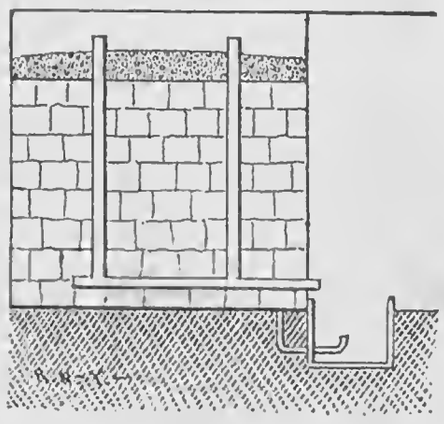

FIG. 531.

slopes to the front just enough to cause the drainage to flow into a pipe provided to receive it. This pipe is protected by a fine wire-gauze covering to prevent the packing from being washed away. The pipe is carried down through the ground and made to discharge at the bottom of the pool. This is important, for if it discharged into the top air

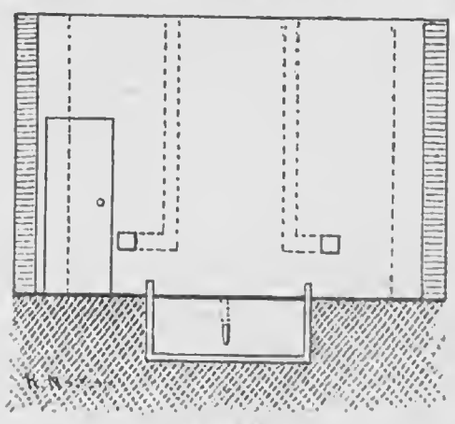

FIG. 532.

would pass into the ice through it and waste it considerably. The outlet of the pipe being always covered with water prevents any access of air through it. At Fig. 532 is shown the front view of the wall of the creamery with the openings of the cold-air pipes and the tank between them. On one side may be made a refrigerating closet for keeping butter in, or one may be made on each side if desired.

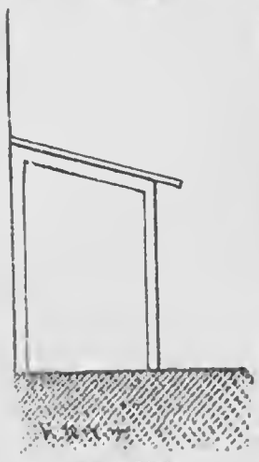

FIG. 533.

This may be made of sheet iron nailed on the inside and outside of the studding and also overhead, and painted outside with brown mineral paint and white within. The roof of this closet should slope considerably to the rear (see Fig. 533), and a metal gutter should be provided to catch the water of condensation which will gather on the roof, and this should be carried off outside through a pipe having an S trap in it to prevent air passing in. This arrangement provides in every way for economizing the ice and utilizing the water which wastes from it. It would be necessary to provide stoppers for the pipes, to regulate the flow of cold air and prevent a larger consumption of ice than is necessary; and also to use but one pipe at a time leaving the other for use when the ice which supplies one is exhausted. This would make it necessary to divide the ice-house so that one-half the ice could be kept intact for the latter part of the season when the other half has been used. This is better than having one large ice-house, and would be much more economical of ice. The door of the ice house is shown at Fig. 530. This is double. The outside is a tight-fitting door shutting upon wide jambs and fastened by keys or wedges in strong staples which come through the door (see Fig. 534), so as to draw the door tightly up to the jamb. This makes the best fastening for a door of an ice-house. The inner door is simply pieces of board, placed across the door-way and held fast by the inside packing. The door of an ice-house should be made in sections, one over another, all the way from the sill to the plate; and one section may be closed after another as the ice is put in, or opened as the ice is taken out.

FIG. 534.

An ice-house for ordinary use is made in the manner above shown, but, of course, without any of the pipes here described. The walls are double with a space of eight or ten inches between them and this is filled with sawdust, tan-bark, dry swamp muck, chaff, leaves from the woods or cut straw; these being preferable in the order in which they are named. If the inside is lined with close-fitting boards no inside packing is required except at the bottom and the top. The upper part of an ice-house should have abundant ventilation so that the covering is kept dry at all times. Dry packing is a perfect non-conductor; as soon as it becomes wet its effectivenes is reduced in proportion to the moisture it contains.

Miscellaneous.

CATALOGUES, ETC.

TEXAS AND HER CAPABILITIES. — This pamphlet of 60 pages is a paper read by Colonel W. W. Lang before the Farmers' Club of the American Institute. It contains a full and lucid account of the resources and capabilities of the youthful giant of the Southwest, together with a brief summary of the advantages of the State as a field for immigration. With an area of 274,356 miles or 175,587,840 acres, Texas offers a great diversity of soil and climate to those searching for suitable locations for any form of agricultural industry. The enormous increase of immigration of late years, not only from Europe but from the North and even West, and, more than all, from some of the other Southern States, amply demonstrates the high opinion entertained of the State's advantages. Between 1870 and 1880, the population has nearly doubled, having run up from 818,579 at the former date to 1,592,574 at the latter. In 1850 the production of wheat was less than 50,000 bushels, mainly in the extreme northern counties, where alone it was thought wheat culture could be successful. In 1878 the wheat crop amounted to 4,000,000 bushels, and its production was limited only by market facilities. In this little pamphlet is condensed a great deal of information about the State, which must be of much use to intending immigrants, and of not a little interest to the general public. The work will be furnished *gratis* by the Southwestern Immigration Co., Austin, Texas, or 243 Broadway, New York City; and we certainly advise all our readers to send for a copy which will prove instructive winter reading.

SOME POINTS IN THE LAW of interest and use to business men. This little pamphlet of 30 pages contains answers to some simple questions frequently put to lawyers by laymen. It is by Everett D. Barlow, Attorney and Counsellor, 206 Broadway, N. Y., and is furnished, we believe, *gratis*.

A TREATISE on the Insects Injurious to Fruit and Fruit Trees of the State of California, and Remedies recommended for their Extermination. By Matthew Cooke, Sacramento.

What Others Say.

FALL PLOWING.—At the last meeting of the Elmira Farmers Club, the advantages or disadvantages of Fall plowing were discussed. J. F. Becher said that he had tried in the same field, part plowed in Fall and the remainder in Spring, to see which plan brought a better crop, and invariably the Fall plowed portion had exceeded in yield. In some cases he got twice as much grain from one acre of Fall-plowed land as from an adjoining acre left to plow in Spring. Heavy uplands, he thought, could not be worked early enough in Spring for oats or barley without Fall-plowing. In some years when left to plow in Spring the seed must be put in three or four weeks late, simply because the land does not get into condition to work soon enough. That is reason enough, by itself, for doing as much of the work in Fall as can be done. Secretary Armstrong remarked that, after all the advantages of Fall plowing visible in his practice, he was aware that there are farmers who work land of similar composition who say that Fall plowing wastes fertility. He could not say how, yet they say after trial that their lands run down under the treatment. C. H. Lewis stated that if Fall plowing makes lands poor his farm ought to be in a very low condition, for that had been his practice a great many years. But, instead of impoverishing his soil, it had constantly improved—its fertility increased. A letter received after adjournment gave the experience of a Michigan farmer. It was in the fore part of August that he began to turn over an old pasture lot for wheat. It is not necessary to tell why this was done at so unseasonable a time. He had a strong team and went around the whole twelve acres, intending to re-seed it and have as few dead furrows as possible. The soil was the same as is found on all the burr-oak plains in Michigan—a dark sandy loam with gravelly subsoil. He plowed one day, but the soil got so dry and hard that he was obliged to give up the job. He had then about two rods in width plowed all around the field. The next Spring he plowed the remainder and planted the whole to dent corn. When it came up the cut-worms began to take the young plants, and he began to take them between a pair of hickory pincers which he had made. He killed 5,000 and then stopped counting. But not one did he find in the strip plowed in August. The corn on this strip came quicker, grew faster, ripened earlier and the grain was brighter and heavier. He was pleased with his Fall plowing that year.

CANE AND GRAPE SUGAR.—We find the following in the Boston Journal of Chemistry: There is no body or substance which has a distinct physical or chemical property which constitutes sweetness; or, in other words, sweetness as a *thing* does not exist. All we know about it is that certain molecules of matter grouped in certain forms have the power of producing upon the moist surfaces of the mouth and tongue the agreeable sensation called sweet. . . . Analysis shows the structure of sweet bodies, but nothing more. So far as science is capable of explaining things, it often fails at the most interesting stage of inquiry, and this is the case with sweets. It fails to show why a lump of sugar is sweet, and a drop of vinegar or acetic acid is sour; the point where light ceases to fall on the pathway of the investigator is that where curiosity and interest most intensely center. *Why* bodies are sweet, sour, or bitter can never be known: the mystery belongs to that department of organic life not open to human research . . . . The statement that the degree of sweetness in bodies is due to apparently slight modifications of molecular constitution is illustrated in a comparison of the chemical structure of several allied substances. In a molecule of cane sugar we have this grouping: $C_{12}H_{22}O_{11}$; in one of glucose, $C_6H_{12}O_6$; and lactose, the sweet principle in milk, has the same constitution. This affords a view of the molecular structure of the three principal sweets, as known and distinguished, the one from the other, by the distinctive degrees of sweetness each possesses. It will be observed that there is no difference whatever in the nature of the materials or atoms of which they are composed; each is made up of carbon, hydrogen, oxygen, and nothing else. The distinction is manifestly due to the grouping of the same elements in different proportions, or by different methods. We have in cane sugar a larger molecule, so to speak, it having nearly double the number of atoms, as compared with grape sugar, and it holds a maximum of sweetness; but if we had the power of doubling the molecule of grape sugar, it would not give us cane sugar. . . . Cane sugar, the noblest and best of all the sweets, is presented to us in the form of aggregated, well-defined crystals, permanent under all atmospheric changes, and elegant in luster and freedom from color when well refined. It is not only the *sweetest* of the sugars, but one of the indispensable gifts of a wise Intelligence to man. It is called cane sugar because it is produced spontaneously and abundantly in the cane grown in tropical climates. . . . While it is impossible, at the present stage of our knowledge, to make cane sugar artificially, it is quite easy to make grape sugar in vast quantities. We find it easy to make the sugar we do not specially want, but not easy to make that we so much need; and this is not a little tantalizing. Grape sugar is what is known as *glucose*, and this delicate organic product, elaborated from the fine

juices of the grape in nature, is now reproduced after the coarser methods of the chemical laboratory. It is almost or quite a pity that this new industry has sprung up and reached such proportions in our country, for it opens the door to a new kind of fraud which, although not necessarily dangerous to life, is of a most reprehensible character. . .

TUNIS AS A GRAIN-GROWING COUNTRY.—The Pall Mall Gazette says that the possibility of American wheat being eventually driven from the markets of Europe by grain from Tunis has been suggested. Land can be bought in Tunis, it is said, for half the price it costs in the Western States of the American Union, and it is so fertile that it will yield two crops in the year. The quality of the grain, moreover, is equal to that of the much-prized Hungarian wheat. Excellent horses, though of a lighter breed, can be bought for a fraction of the cost of horses in the United States, and draft oxen far less than one-half the American price. Finally, while the American product has to be carried hundreds of miles by rail to the coast, and has then to undertake a long sea voyage, the most remote Tunisian farms will be comparatively near the coast; and the port of La Goletta is only sixty hours distant from Marseilles, rather less from Genoa, and only twenty-four hours farther from Trieste and Fiume. The farmers, moreover, will be able to grow a vast amount of other produce, which will greatly increase the remunerativeness of their farms, and consequently decrease the cost of raising wheat. All that is required to develop this competition is the extensive immigration of industrious European settlers, with European capital and agricultural appliances; and the wealth waiting to be secured is so great that such immigration, we are informed, is sure to follow French annexation, and the security for life and property consequent thereon. It may be suggested that recent events in Algeria do not promise that security to life and property would necessarily follow French annexation. Leaving this consideration on one side, however, the argument is interesting as bearing on the future of the American farmer. Granted the full settlement and development of North Africa under a more liberal commercial *regime* than the French seem disposed to introduce where they set foot, the American farmer would soon find out the injury which the American tariff inflicts upon him.

PROFESSOR S. A. KNAPP, of the Iowa Agricultural College, is, says the N. Y. Tribune, more and more impressed with the great value of coal tar for timber. He thinks that coal tar does almost perfectly preserve our soft woods. "The vat for heating the tar may be made like an ordinary sap pan and of any length; put in a barrel of tar and dip the whole post or as much as desired. The most particular part to be covered is that just above and below the surface when set. Where great durability is desired the post should be boiled thirty minutes or more; ten minutes will answer for boards. A barrel of coal tar, costing $3 will cover 150 posts if boiled, or 200 if dipped one half length. The cost of boiling lumber in tar is estimated at $5 per 1,000 feet, and thus prepared even basswood is practically indestructible."

AS TO the practical value of good muck as a manure, Dr. Hoskins says that within a mile-and-a-half from his home there is a muck bed, originally of four or five acres, which has been worked for many years and has greatly aided to keep up the fertility of one of the best grass farms in the town. This muck has now been about one-third used (the depth in the middle of the basin being about four feet), and the owner will not sell a load of it, believing it to be worth to him as much as all the rest of the farm. In the 20 years he has been using it he certainly has had ample chance to make up his mind about it.

Dr. James R. Nichols in a recent address said: The whole theory of agricultural education is based on the idea that farmers' boys and the young men must be educated by attending some agricultural college, so-called, for a term of years; but the farmers themselves, the real workers in the field, may be left to obtain light and help from the profitless disputes and endless discussions common in farmers' clubs, or from the vapid talk of politicians at fairs and cattle shows . . . . The young men may attend the agricultural colleges or any other institutions of learning, and be greatly benefited by a prolonged course of study; but we need another kind of college, —*a farmers' college*, where the practical workers can be graduated without diplomas, at the end of a brief course of instruction extending over a few days or weeks . . . .

ON every farm, says the agricultural editor of the New York World, where hogs are butchered annually it pays to provide conveniences for this disagreeable work in form of a suitable scalding vessel, gambrels, scaffold and sharp knives. As soon as the animals are sufficiently fattened every preparation should be made, so that advantage may be taken of the first suitable weather without delay.

GENTLEMEN may cry cashier, and cash there, but when the board of directors wake up there is cash nowhere. . . . . New York Tribune:—Mary Amanda, quite fresh from town, made her rustic friends laugh the other day by innocently asking at dinner if the white and red beets both grew on the same stem. . . . . Western Rural:—One of the greatest dangers that threatens the American people to-day is their failure to act promptly in the redress of unmistakable wrongs. . . . . The Journal of Chemistry says that the following recipe makes a good pain-killer for external use in bruises, sprains, etc.:—

Spirits of camphor	2 ounces.
Tincture of capsicum	1 ounce.
Tincture of guaiac	½ "
Tincture of myrrh	½ "
Alcohol	4 ounces.

. . . . The Druggists' Circular gives the following formula for a liniment. Rub in twice a day:—

Kerosene	2 ounces.
Tincture of opium	4 drachms.
Tincture of arnica	5 "
Tincture of stramonium	4 "
Aromatic spirits of ammonia	6 "
Spirits of camphor	5 "
Oil of origanum	4 "
Chloroform	3 "

. . . . According to Bouchert's experiments, even the tape worm succumbs to the digestive action of pepsin. . . . .

A lover forsaken
A new love may get,
But a neck that's once broken
Can never be set. . . . .

Do you think it is because of the great improvement in spring beds and mattresses that people lie so easily?

Everywhere.

RURAL SPECIAL REPORTS.

Arkansas.

DAYTON, Sebastian Co., Nov. 5.—My Rural seeds were an entire failure on account of the severe drought. Crops gener ; were great failures. Wheat is worth $2 per bushel: corn, 75c. to $1; bacon 14 16c; dressed pork 10c. per pound; cotton, . to 10½c. per pound. More wheat has been sown this Fall than any Fall since the war. Some are still sowing. Weather fine and pleasant; no frost yet to speak of. G. W. R.

Canada.

THE RIDGE, North Hastings, Ontario, Nov. 6.—Wheat crop abundant, b oats and peas and roots suffered from the drought. My Washington Oats surprised my neighbor greatly—they reached the hight of five feet seven inches, and the best heads were 17½ inches long. Mold's Ennobled Oats were greatly admired also and reached a hight of five feet four inches. The White Elephant Potato was very small—I cut it into twelve pieces and all grew. My soil (new) was not equal in kindness and I reckon I had only four good hills out of the 12. They stood the drought wonderfully, keeping green till the end of September. I harvested 80 potatoes, small and large. Would you recommend planting one set only in each hill next year. [Yes, for a large crop.-EDS.] Your Wheat Number was greatly admired. I was a competitor and was surpassed by none and only equalled by one in Russian Spring Wheat. I did not get a prize, but I have a substantial reward in the report I have to make as to the yield per ear of culls remaining from the ones I sent. I have counted as many as four spikelets with five grains each on a single ear, and 12 heads yielded exactly an average of 66 grains per head. Not bad for a bush farm! My Rural Branching Sorghum reached only a hight of 15 inches, I am too far north for it (lat. 45). My asparagus did not come up. H. T. M.

Florida.

STARKE, Bradford Co., Nov. 9.—It is still very warm and dry here—nearly 90 degrees in the shade most of the time. We have showers occasionally, but they are like angels visits, few and far between. Very hard to get plants started for winter gardens. A light frost was reported on the 4th and 5th in some places near us, but we had none here. Cotton is nearly all gathered; the season has been a fine one for picking it; it is very white, no rain having fallen on it, but the staple is short and seeds very heavy, so that it takes about a pound more of seed cotton to make one of lint than usual. Sugar cane and sweet potatoes are also light crops, owing to the dry season. Oranges are scarce, small and rusty. The dry weather coming after the severe cold last Winter would not bring a very liberal crop of fruit; we could not expect it, but we hope for better things next year. I. S.

Georgia.

HARMONY GROVE, Jackson Co., Nov. 9.—The corn crop of the State has been seriously injured by drought and to some extent by insects in many localities. Upland corn is almost a total failure, while in limited localities in every section of the State the crop is remarkably fine. The area under oats was reduced by the continued rains during the Fall, Winter and Spring, and the yield was reduced by drought in May. The area sown in wheat was small on account of the unfavorable weather for preparing the land and sowing during last Fall and Winter. The area sown was only 60 per cent of the average and much of that was sown in January and February; consequently it was more subject to rust on account of late ripening. Notwithstanding these disadvantages the yield is reported at 78 per cent of an average crop. The average condition of the cotton crop of the State on August 1 was 81, compared to an average crop. This was still reduced by the continued drought through August. The caterpillar cleaned the fields in this section, but too late to do much damage. My White Elephant Potato, owing to the drought and poor soil, did not yield well. The Washington Oats blasted somewhat but stooled well and gave a good yield. The Rural Branching Sorghum did not germinate well, but it continued green through the drought. I planted it March 26 on poor land and it had but little work. On Oct 1. it began to head, and the seed is now in the dough: if the frost will stay off another week. I will have plenty of seed. It is nine feet high. G. W. K.

Illinois.

WAUKEGAN, Lake Co., Nov. 14.—The small White Elephant Potato had five eyes and was planted in as many hills: yield, 28 pounds. The other seeds did finely. I have read the RURAL for 30 years, and never found it better than now. J. P. N.

Indiana.

LOGANSPORT, Cass Co., Nov. 6,—The Washington Oats were sown broadcast in the garden rather late and raked in; chickens scratched the ground over and no doubt ate many grains, but what was left came up and grew about four feet high and yielded four pounds and ten ounces of fine grain—no smut. The White Elephant had nineteen eyes; one end was sprouted; all the eyes that had more than one sprout I cut into two and planted 23 hills; 22 grew. The eyes that were cut into two made fine, thrifty hills. There was only one sprout in a hill three feet apart; manured with barn-yard manure. I hoed them frequently enough to keep the weeds down. I dug 44 pounds of fine potatoes though they seem inclined to rot, probably caused by wet weather of late. The Rural Branching Sorghum did well considering the excessively dry Summer. It grew seven feet high, but did not head out until the Fall rains set in—about the middle of September; consequently it was too late to ripen. I think for fodder or soiling it is superior to anything else, as the stalk is fine and the blades are large and dense. I planted it in rows three feet apart, one foot apart in the row, and it was a dense mass of green. The asparagus did tolerably well. The flowers were splendid. J. H. S.

NEW HOLLAND, Wabash Co., Nov. 10.—Wheat is injured by the fly. Corn is tolerably good in this part of the county. The same cannot be said of late potatoes, the weather having been too dry for them. I raised about a peck of White Elephants. I think they are the "boss" potatoes. The other RURAL seeds did well. J. H. W.

Iowa.

OLIN, Jones Co., Nov. 12.—My Elephant potatoes did well, and were admired by all who saw the growth they made. My Washington Oats lodged and smutted badly, but I saved some seed. The corn and oat crops are very light for this section, the former going about 40 bushels per acre, and the latter about 30 bushels. Owing to the scarcity of hay last Winter, fodders of all kinds (except ensilage) were pretty well looked after this season. Hogs, $5.25 to $5.50; corn, 50 cents; oats, 38 cents; cream, 25 cents per inch; butter, 20 to 25 cents. A. K. R.

Kansas.

NEW PITTSBURGH, Crawford Co., Nov. 6.—I planted the White Elephant late and got 18 small tubers—hope to have better success next time. The asparagus came up well; the drought was hard on it, but the late rains have started it to growing finely. The Rural Branching Sorghum came up well, branched out finely, but the chinch bugs made a vigorous attack on it and the extremely dry weather killed it all. I have a few seeds left, however, to plant next Spring; I feel confident it will be a fine fodder plant. The Washington Oats were planted late; but did well with but little smut. I shall give them one more trial. The flower seeds we did not plant, but I shall try them next Spring. We prize the RURAL highly for its valuable information. J. A. L.

ODEN, Barton Co., Nov. 10.—The White Elephant Potato grew nicely—13 hills of it—but at harvest, when we cut the wheat that grew near, the potato beetles left the bull nettles and made so energetic a raid on the Elephants that it was impossible to save them. The Washington Oats did well considering the unfavorable season. The Rural Branching Sorghum seems not to care a whit for dry weather; but the cold, wet weather in May kept it so far back that we got no seed from it. The asparagus promises well. We have had plenty of rain since October 1, and the prospect for a good wheat crop next year is encouraging. A. J. M.

PEORIA, Franklin Co., Nov. 8.—A great deal of rain this Fall; ground pretty well saturated. Very few vegetables have been raised here. Fruit very scarce, and what there is is of very poor quality. Very little wheat has been sown this Fall: that sown, however, has made a strong growth—it has to be pastured to keep it from jointing. M. P. B.

Michigan.

FREELAND, Saginaw Co., Nov. 8.—The RURAL seeds did splendidly for the dry season we had last Summer. The White Elephant Potato I cut into 21 pieces, planted one eye in a hill on May 6, and on Sept. 1, I dug 49 pounds. I shall save all of them to plant next Spring. From the one ounce of the White Washington Oats I harvested 6 pounds and 14 ounces of very nice grain. I sowed two ounces of the White Russian alongside of it, and received only 8½ pounds. The Washington Oats were ripe July 25 and the White Russian August 10. The asparagus seeds grew well and the plants stand about two feet high. The Rural Branching Sorghum I planted May 5, and about two-thirds grew, and all the fault my cows found with it was that they did not get enough. The flower seeds came up well and mostly all the pinks were double—they were beauties. In regard to crops about here: Wheat averaged about 12 bushels to an acre—better than was expected; quality good, selling now for $1.35 per bushel. Corn good. Potatoes about half a crop, selling from 75 to 80 cents a bushel. Oats good; 48 cents a bushel. Hay very light; baled selling from $18 to $20 a ton. H. B.

NORTH BRANCH, Lapeer Co., Nov. 7.—We have had a very unfavorable season here for nearly all kinds of crops. In the latter part of March the snow went off leaving the winter wheat exposed to alternate freezing and thawing for nearly two weeks, which greatly injured the crop. A great deal of the land that had been sown to wheat was put into Spring crops, or summer-fallowed; what was left yielded less than half a crop. The principal varieties are Clawson and Fultz. Oats are a very small crop and of light weight. Corn on low land is about two-thirds of an average crop; while that on dry upland will scarcely pay for the labor required to gather it. Hay is a light crop, but of good quality. Peas and beans almost a failure. Potatoes yield from 100 bushels down to 18 bushels per acre; generally the yield is nearer the latter number. Fruit of all kinds is very scarce. The few apples we have are very poor in quality. The main cause of the poor crops was the long-continued drought, which commenced about the middle of June and continued about three months. The Rural Branching Sorghum withstood the dry weather the best of any thing I had on my farm. It attained the hight of only four feet by the 5th of October, when it was singed by the first frost of the season that did any damage here. It looked fresh and green all through the dry spell, while sweet corn nearby it dried up almost entirely. If it is relished by stock and is as nutritious as fodder corn, I think it should take the place of it, for it stands the drought so much better after it gets fairly started. I received about four ounces of the White Elephant Potato from which I dug 33½ pounds, most of them being of a good market size; the largest one weighed 18 ounces. The Washington Oats did very well, but one quarter of the heads were smut. I have three good sheaves of them; have not thrashed them yet. I think they are the same as a kind my father had sent to him by the Agricultural Department at Washington about ten years ago, called Shonen. I had them growing side by side, and they looked alike in every particular. Are not Burbank's Seedling potato and the White Elephant sent out by the RURAL the same? [Not at all.—EDS.] The vines look just alike, ripen at the same time, and the tubers look so much alike that if placed side by side I do not think the best judges could tell one kind from the other. However, if they are distinct varieties they are both excellent, for they have yielded twice the quantity of any other potato raised around here this season. Winter wheat is doing exceedingly well. It has been very rainy for about five weeks and the ground is getting well soaked up again. The prices of farm

produce are as follows: Wheat, $1.20; corn, 75c; oats, 40c: potatoes, 75 to 90c; hay, $15 per ton; pork, $7; butter, 25c; eggs, 16c per dozen. D. W. C.

Missouri.

COLLINS, St. Clair Co., Nov. 6.—The RURAL seeds were planted in good time and condition and came up and grew finely, but the dry weather and chinch bugs ruined most of them. The sorghum has sprung up again and headed out; if warm weather lasts a few days longer I shall have seed. The fruit trees and red-bud bushes are in bloom. It has been raining for six weeks, more or less. W. V.

PLEASANT MOUNT, Miller Co., Nov. 7.—Farmers are not through sowing wheat as yet, being considerably behindhand. From the middle to the last of September is generally considered the best time to sow wheat; but last year wheat was more or less damaged by the fly. This fact, with the drought which prevented the preparation of the ground as early as usual, delayed sowing. The weather was all that could be desired; but the rainy days came and the ground soon got too wet, and very late sowing is the consequence. The weather is still very mild, though we had a hard frost on the 3d of this month, which killed tender plants, such as sweet potatoes, beans, etc. Corn in shucks and oats in the stacks are badly damaged, sprouting wherever exposed to the rain. Wheat that is still unthrashed is damaged very badly—so much so that thrashing it out is slow, laborious work. Farmers are marketing their stock as fast as possible, as the scarcity of feed and fears of another hard Winter are causing them to sell very close. N. J. S.

Montana.

TWIN BRIDGES, Madison Co., Nov. 10.—The Washington Oats did well, but there was some smut. The White Elephant Potato came too late, and was a failure in consequence. The flower seeds I gave to a neighbor's wife and she is much pleased with them. Crops of all kinds did well this season. Wheat went about 20 bushels to the acre; oats, 35; potatoes, 120 bushels. Wheat is worth $1 per bush.; oats, 72c.; potatoes, 60@80c.; hay, $10 @$25 per ton. Mining and stock raising are the leading pursuits in this country. I think the RURAL the best agricultural paper published, and would not be without it for double the subscription price. T. D. E.

New Jersey.

CLOVE VALLEY, Sussex Co., Nov. 12.—From the White Elephant sent me by the RURAL I had 65 potatoes weighing 32 pounds. Twenty-five of them weighed 20½ pounds. There were six hills altogether. J. J. W.

HAMILTON SQUARE, Mercer Co., Nov. 8.—The White Elephant Potato got frosted in the cellar before planting. The Washington Oats were sown on very poor ground and yielded only 1½ pound. The asparagus seeds all came up well and have grown nicely. Owing to the late and cold Spring the Rural Branching Sorghum did not grow very fast, and frost came too early for it, so I lost the seed. I am satisfied it will make a valuable fodder plant. I should be glad to pay for any seed which any of the RURAL family can spare. L. B. WELCH.

New York.

BEDFORD STATION, Westchester Co., Nov. 13—The asparagus seeds germinated very evenly and are all doing well. From the Washington Oats I harvested four quarts, weighing 4½ pounds; they were sown too thickly or the yield would have been greater. The sorghum seeds germinated well, but never seemed to thrive; the season was very wet and cold early and very dry later. The plants only attained a hight of two or three feet. The White Elephant Potato, cut to 15 single eyes and planted one eye in a place, yielded 24½ pounds of very fine potatoes. The main crop of potatoes, raised from whole seed and plowed and hilled up both ways, was hardly worth digging, though planted on much moister ground than the White Elephants. I am convinced that one eye in a hill is enough if one is particularly vigilant in protecting them from the beetles when they are first appearing above ground. "B."

CATON, Steuben Co., Nov. 7.—Crops were light in this section. Potatoes, corn, grain and hay were only half crops. Potatoes are worth from 80c@$1 per bushel; wheat, $1.45; oats, 50c.; buckwheat, 80c@$1; corn, 40@80c.; apples, a light crop, 50@60c. per bushel. Good Timothy hay about $14 per ton. H. W. M.

MIDDLE FALLS, Washington Co.—The Rural Branching Sorghum planted June 1, grew 10 feet high. It was cut the middle of August and fed to the cow; she liked fodder corn better. The Washington Oats grew well, but smutted badly. Dry weather nearly spoiled the White Elephant Potato. I. H.

SHARON, Schoharie Co., Nov. 5.—I read with a good deal of interest the crop reports from everywhere in the RURAL, and I think that one of the best features of the paper. Especially am I interested in the reports of the free seed distribution. While I cannot give as good a report as some of your readers, I am satisfied, and am led to inquire who can estimate the value of these distributions, spread out as they are over our whole country? One of the benefits I see already is this: We all seem to be interested in this one thing, and as such seem to be drawn together as a band of brothers with one common interest. [We hope so.—EDS.] I tell you it is becoming a power already in the land, let other papers ignore the fact or not. My Elephant yielded me 26 pounds of fine tubers, with no extra care. The Washington Oats, after the hens had taken a quarter of it, gave me 13 pounds of fine grain, and, as most reports say, there was quite a good deal of smut in them. The Branching Sorghum was a failure; only three or four hills came up. The asparagus has done very well. Of flowers we had a fine lot. While the drought has given us some short crops, prices are good for all we have to sell, so I don't see how the dry spell has been very detrimental to us after all. Winter wheat has given us an average yield, and is worth $1.40. Spring grains were good crops. Corn is the poorest for years, with few exceptions. Buckwheat is not one-half a crop; it is worth 80 cents a bushel and flour $3.75 a hundred. Hay right here was a heavy crop, and that is one of the exceptions; it is selling here, baled, for from $12 to $15 a ton. Dressed hogs $8.00 per hundred pounds. Working cattle are very high, selling for from $125 to $150. Stock of all kinds scarce and in demand. Butter is bringing 28 to 30 cents; cheese, 12 to 13 cents; eggs, 25 cents. Potatoes are a very short crop, and have been selling from 75 cents to $1 a bushel; apples are an unusually short crop, but are selling here at $1.50 to $1.75 per barrel. S. L.

WEST BROOKVILLE, Sullivan Co., Nov. 1.—The White Elephant Potato was planted in seven hills; we dug one peck of fine, nice-sized tubers. The Washington Oats did well until nearly ripe, when the chickens found them out and destroyed about half. We gathered about three pints; the seeds were good and full. The Rural Branching Sorghum we think the most valuable of all. It grew seven feet high; 17 stalks were the most we had from one seed. What was cut off August 1 grew right up and would have been a fine crop had it not been for the drought. The pinks were very pretty; there were eight kinds. The asparagus seeds grew well. We feel in debt to the RURAL NEW-YORKER for the seeds, as well as for the great agricultural information it gives us every week. M. W.

Ohio.

WAUSEON, Fulton Co., Nov. 5.—The free seeds sent to me were received in good condition. They were planted in our common black soil near a large ditch. As we had uncommonly high water last Spring they were twice under water for a few hours. The White Elephant Potato (a small one, which probably weighed about two ounces) had ten eyes, which were planted in as many hills, and yielded 9¾ pounds, or 74 times the weight of the seed—a good yield considering the chances, as it was better than other potatoes near-by. Potatoes were a poor crop here this year. The Branching Sorghum was not cut, and grew to the hight of 11 feet, looking like our common cane. A few stalks grew from a seed, therefore a few seeds produced many stalks. The oats, having beards, will probably not be a desirable kind here. The flower seeds grew, but were destroyed by chickens. M. E. D.

Oregon.

MONMOUTH, Polk Co., Nov. 4.—The White Elephant Potato weighed 2½ ounces, was planted June 9, in nine hills, on land which received no manure, and yielded 25 pounds of fine tubers—four of them weighed six pounds. The Rural Branching Sorghum failed to vegetate, and the oats were badly smutted. J.M.R.

Pennsylvania.

MUNCY, Lycoming Co., Nov. 9,—We have received the RURAL NEW-YORKER regularly and are always glad when it arrives. We are not farmers; at least our farm is on a small scale—our lot being only 150x182 feet. On this we have our buildings and door-yard, also 26 apple trees and six plum, eight peach, four quince and one pear, as well as 13 grapevines. Then in the rows of trees we have our small fruits, and, besides, we raise all our vegetables and sell quite a good deal of our surplus. We grow tomatoes, asparagus and celery in abundance. We excel in celery. The RURAL seeds came to hand in good order. The White Elephant had 16 eyes. I cut it to one eye in a piece. Then as my room was small I planted the 16 pieces in eight hills. When I lifted them I had 14½ pounds. The asparagus all grew and the stalks are now about 12 inches high. The Branching Sorghum was a failure. The Washington Oats grew well but about the time of heading they were beaten down flat, yet I got some oats better than what I sowed. I shall try it again. The dianthus, picotee, carnation and pink seeds all grew, and the dianthus bloomed and was very handsome. We were especially pleased with the description of the Perfection Golden Heartwell Celery, on page 586 of the Fair Number, and we shall be very glad to try it. I. R, B.

[Thanks for the communication. Our next seed distribution will be forwarded to all subscribers who apply inclosing two three-cent postage stamps. We send the entire collection to all, as it would be impossible for us, in so great an undertaking, to select for special needs.—EDS.]

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

TREATMENT OF TUBEROSES, ETC.

M. J., Wichita, Kansas, asks: 1, how to treat his tuberoses. He started them in boxes in the Spring, and set them out when warm enough. The Summer was very warm but dry, and copious rains have fallen lately; yet there hasn't been a single blossom, but, instead, copious foliage growing rapidly. He says: "Shall I dig them up as they are now growing thriftily, and let them dry in the shade? Will they be likely to flower next year? Why didn't they bloom? Should they be managed just the same in house culture as for out-of-doors? 2. How to grow smilax. 3. Is the Variegated Wax Plant as desirable as the plain, green-leaved sort, and does it bloom as freely?

ANS.—It would have been better to start your tuberoses in small pots instead of boxes, as you could then have transferred them to the ground without disturbing the roots. The drought was probably the cause of their not flowering, as was quite common during the past season; but it may have been owing to the fact that they were not flowering roots, many such being sold every year. If a tuberose be full and plump at the neck, it is pretty certain to flower, otherwise not. As your plants are now growing thriftily, they will no doubt flower well next year. Let them grow till the frost has killed the foliage, and then lift and trim them, and put them away for the Winter. The so called "small bulbs" are found growing on the large one, and are easily rubbed or broken off at the time of planting. These may be planted separately, and will in time make flowering bulbs. The tuberose should be grown in a rich soil. The same bulb, as a rule, will flower but once. If by "house culture" you mean tuberoses for Winter-flowering, you must buy bulbs that have been prepared for the purpose. Unless you have a good plant-house, with plenty of heat and moisture, you had better not attempt to force the tuberose in Winter, for it demands more than ordinary care and skill, and few succeed. You can have the plants in flower in the house in Fall and early Winter by planting good bulbs in five or six inch pots late in the Spring, plunging the pots in the ground during the Summer, lifting them in the Fall before frost, and taking them into the house (or sitting-room), where they will often remain in bloom for a month or more. This will probably suit you. We usually grow a few in this way. 2, Smilax will grow more readily from seed, though cuttings strike readily enough in a green-house. If you have an old plant you can easily multiply it by dividing the roots when the plant is dormant, say in August or September. 3, The variegated Wax Plant is very desirable, and much prettier than the plain kind, but does not grow or flower so freely as that. It is really a very handsome plant, but you must look out for mealy bug.

NINE-BARK.

T. G. T., Horn Brook, Pa., sends for name a stem, leaves, seeds and dried up flower of a plant found growing wild by a roadside running along a river at the foot of a neighboring mountain. It was taken up and transplanted to the garden, where it produced a handsome flower, white tinged with pink as it grows older. It grew about four feet high and blossomed in early Summer.

ANS.—It is Spiræa opulifolia or Nine-Bark. It is a native of rocky river banks especially westward. It is not a pretty shrub when small, but its form becomes rounded and the foliage ample when it gets older—say from four to six years. The leaves are three-lobed somewhat resembling those of the currant. The branches become recurved after a few years and plants often grow to the hight of 10 feet. The bark exfoliates—hence the name of Nine-Bark. The fruit consists of several inflated follicles of a reddish color forming in early June. These follicles are often showier than the flowers, as, when abundant, they give to the whole shrub a red color. The golden variety of the old-fashioned shrub is in all respects like the species except that when the leaves first unfold, they are of a bright golden color. Some of this reappears in the Fall.

THE SWEETEST STRAWBERRY?

W. F. K., Clinton, La., asks which is the sweetest strawberry without reference to size, season or productiveness.

ANS.—A question like this may be answered with much amplification or the simplest brevity, according to the point from which we look at it. If sweetness and flavor combined be meant, there are two or three claimants for the undesirable distinction, with little to choose between them when ripe, and all simply flat. If mere sweetness without flavor be meant, we should name the old Burr's New Pine; but this is now out of cultivation, and with all its goodness would only find a place in the amateur's collection. Size and productiveness have driven such kinds to the wall. Our correspondent, perhaps, refers to *quality* rather than to sweetness alone, and to kinds now generally grown. In that case he will open a question of some magnitude, and we will try again if he will make his point clear.

CAKED UDDER.

G. H., Hackettstown, N. J., has a three-year-old cow that dropped her second calf last May. She was milked immediately, but the next day the udder was caked and she refused to let down her milk. The bag was bathed with warm milk, etc., and for some time the swelling diminished a little, but the udder again swelled, now in one part and then in another, and our friend asks for some remedy.

ANS.—Give the cow 12 ounces of Epsom salts, and the day after one ounce of saltpeter, feed only dry hay: bathe the udder with warm water and knead it gently with the hands until it is softened. When it is better some bran slops may be given.

Miscellaneous.

H. S. B., Okolona, Miss., asks how to plant the pyracantha for a hedge.

ANS.—In your climate it may be planted now. Dig trenches two feet wide. Throw out the poor soil; add good. Place the plants two feet apart. Spread out the roots; pack the soil firmly over them. The habit of the pyracantha (Crataegus pyracanthus) is very straggling, so that to present a good appearance as a screen or hedge it should be trained against some support. Its growth, too, is not rapid and it is liable to be destroyed by the thorn-borer. It thrives best in a dry soil.

E. W. B., Factory Point, Vt., asks where can pots for potting strawberries be obtained, the price and the best size.

ANS.—Pots two inches across the top, known among florists and manufacturers as "Thumb" or "Verbena" pots, are the best for layering strawberry plants. F. Laufersweiler, 517 and 519 West 27th Street, New York City, and A. H. Hews & Co., North Cambridge, Mass., are extensive manufacturers of flower pots, and are reliable parties to purchase of. The price of Thumb pots ranges from five to six dollars a thousand.

D. W. C., North Branch, Mich., asks: 1, whether the Rural Heavy Dent Corn would be likely to ripen so far north—latitude 43 degrees; 2, how much earlier is it than the Rural Thoroughbred Flint Corn; 3, is the Flint white or yellow?

ANS. 1. Hardly, we fear. 2. About three weeks. 3. Yellow.

A. J. T., Washington, D. C., asks how should the dianthus, picotees and carnations that have not seeded be treated through the Winter.

ANS.—They may be taken up and kept in the window or conservatory to bloom, or they may be left out, with a slight covering.

C. C. D., Minnesota Junction, Wis., asks for a plan of an ice-house and creamery combined.

ANS.—See article on this subject under "DAIRY," in this issue.

C. B. P., Albany, Ill., sends a twig with red berries for name.

ANS.—It is Euonymus atropurpureus—Spindle Tree, Burning Bush. Found east of the Mississippi and often cultivated.

THE
RURAL NEW-YORKER,
A National Journal for Country and Suburban Homes,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, NOV. 26, 1881.

ANNOUNCEMENT.

WE have in preparation a series of articles upon Bonanza Farming in Dakota, with original illustrations.

ALSO, a farm story entitled "The Story of Stony Brook Farm," by our distinguished contributor Henry Stewart, M. D. Our readers are sufficiently familiar with Dr. Stewart's writings to know that a rare treat is in store for them. The story is founded upon the TRUTH, and will be commenced when our present story is concluded.

SEVEN YEARLY SUBSCRIPTIONS WITH $14 ENTITLE THE SENDER TO THE RURAL NEW-YORKER FOR ONE YEAR FREE.

THE RURAL will be sent to new subscribers from now until January 1, 1883, for $2.00, that is, the balance of this year free. The RURAL NEW-YORKER has no club or second price. It is the same to all.

OUR crop of celery is the best, without exception, we have ever raised. The season West and East has been very unfavorable to the cultivation of this fine Winter vegetable, and it is, therefore, generally poor in quality and high in price. To make a long story short, we have raised our fine crop by giving the plants plenty of water daily. Whether it pays or not to do this depends upon the water supply and the distance it has to be carried.

NATIVE white grapes this year scarcely made an appearance in the leading markets West or East. At this time the Catawba is the only native that can now be purchased in a good, sound condition. We fear it will yet be a long time ere the markets will be bountifully supplied with a white grape as good in quality as the Catawba and that will keep as well. A white grape no better than the Concord and that will keep no better is really no acquisition. The color is popular at present, and that is all that can be said in its favor. Gratify this popular demand for mere color, and a white Concord is all that remains.

THE CHEAPEST METHOD TO MAKE BEEF.—On rich soils this is best done by taking the largest and most improved race of cattle, like the Short-horns, for example, and pushing them from calfhood to a reasonable state of maturity for the shambles. This is done by the time they are two to three years old, and not by overfeeding, but by giving the animals all such food as is most suitable for them, and which they can digest well. On rough and poor soils a smaller and more active race of cattle is most proper to breed and rear for feeding off the scantier herbage produced there. These do not mature so early, and are generally left till three to four or even five years old, according to circumstances, and are then brought on to rich pastures in the Spring, when they thrive rapidly, and are fitted as grass beef for the market by Autumn. Sometimes it is profitable to keep and stall-feed these on through Winter and market them in the Spring. This will depend, however, on the thriftiness of the cattle, and the price to be realized for beef.

OUR FUTURE GREATNESS.

THE recent census taken in British India shows the population of that empire to be more than 250,000,000. The supposed population of China is put down at twice this enormous number. India contains five times and China eight or ten times as many persons as the United States. But the steady growth of our population goes to indicate that some persons yet living may see our population reach the figures of the East Indian census. A decennial increase of 20 per cent., or less than two per cent. per annum, will bring the number to over 250,000,000 before the next centennial of our Independence. What then will be the condition of our descendants in whom at least, although so far removed, we should take the most lively interest? Will they have degenerated to the condition of the East Indian ryot or the Chinese cooley? Or will our country now possessing and exhibiting every element for the existence of so vast a number of persons, in an equally favorable condition as that of ourselves, have advanced in due proportion in all the arts of peace and all the enjoyments of wealth? This depends altogether upon the continued maintenance of our liberal institutions; upon public liberty and private virtue; upon the careful fostering of those principles of government and social order, not forgetting the family discipline and careful training, which have led us so far in safety and prosperity. It cannot be believed or supposed that with so glorious a history as lies behind us, the future course of our country can take any other direction than that in which our fathers have led and we have followed. The prospect may seem to be exaggerated by some who are cribbed up in the narrow East, but the mind expands and views enlarge when one stands upon the borders of the vast Western country and sees, yet unoccupied, a country to which the most populous of European nations might be transferred with plenty of room around them to spread in; the richest fields, as yet idle, and untilled; vast ranges of mountains in which are locked up treasures incalculable, and the nucleus of a population eminently fitted to deal with these elements of wealth, and turn them to the best uses for mankind.

THE BURDENS OF EUROPEAN FARMERS.

While we cannot dispute for a moment the fact shown by Mr. Lawes that the purchased fertility of English farms against the natural fertility of American lands is one great element which enters into the question of competition in the production of food, yet there is one other point which has an important bearing upon this subject. This occurs to us in considering the proceedings of the Congress of German agriculturists, which has recently been discussing the alarming condition of German farmers in view of the large importations of American provisions and breadstuffs. The existing and the inevitable further competition seems to make the case of European farmers desperate. There is no disguise which can cover up the conspicuous fact that American farmers can undersell the Europeans in every kind of agricultural produce. In the discussion of the subject one very important element has been ignored by the Germans, although probably it has been all the time very apparent to their minds. This is the enormous public burdens to which agriculture is there subjected. There is no truer or more indisputable fact in existence than that "the farmer pays for all." The soil bears all the burdens. Europe is a vast military camp. Five millions of men and as many horses are kept idle and unproductive, but yet expensively consumptive, in the armies and navies of Europe. A numerous aristocracy and a most costly royalty are maintained at a vast expenditure of the earnings of the farmers.

The soil pays for the whole of it. And all this man and horse power is withdrawn from agriculture. The German farmer sees his son taken from him by force of law and made to serve in the army or the navy, and the poor old man is taxed for his support and the costly trappings, "pomp and circumstance of war," by which he is accompanied. The effect is doubly disastrous. The German farmer who flees from his fatherland, and becomes an American, has the help of his son on his farm here and has no onerous taxes to pay to support an army and a royal establishment. What is the question of the fertility of the soil as compared with these burdens! It is the same in England and France, and the settlement of the "Land Question" in Ireland is fast developing the fact that this great evil was precisely what was the matter with that unhappy country. Here is the great point of the question to be considered, and it is one which seems to make the case of the European farmer hopeless and that of the American farmer impregnable. No law can long stand that increases the prices of bread and meat.

This fact was settled in 1846 in the repeal of the Corn Laws in England and the entire freeing of the trade in food from taxation. Without taxation, American bread, meat, butter and cheese cannot be kept out of European ports, and the question remains, how long starving populations will submit to the taxing of their food to maintain the despotic power of their rulers, whether these be soldiers, kings, emperors or nobles—all idle, unproductive and wasteful. Truly, there seems to be a great political shadow falling across those countries, and it is cast upon them by American agriculture, free, unburdened and prosperous.

HAVE WE DONE AN INJUSTICE?

The following note from the Secretary of the Treasury Cattle Commission reached us just too late for publication in our last issue.

U. S. TREASURY CATTLE COMMISSION,
CHICAGO, Ills., Nov. 10, 1881.

Referring to your paper of Nov. 12, page 768, bottom of last column, permit me to say you are greatly mistaken as to what this Commission recommended to the Governor of Illinois, and your article does us injustice. We recommended to the Governor just what he has done, no more and no less. We never thought of urging him to schedule any State entire. J. H. SANDERS.

Reference is here made to a "Brevity" in which occurs this sentence:

"The Treasury Cattle Commission *at first* recommended that the entire States should be scheduled in any part of which the disease existed; we protested against such an embargo as too sweeping, and we are pleased to see that Governor Cullom has prohibited importations only from the infected counties, thus greatly diminishing the embargoed area."

Our protest here alluded to was made in an editorial in the RURAL for September 24, in which, after stating some cogent reasons why restrictions should be placed on the Western movement of cattle from pleuro-pneumonia-infected districts in the East, we said:

Accordingly the Commissioners strongly urge the Governor to prohibit at once the importation of all cattle from New York, New Jersey, Pennsylvania, Maryland, Delaware and Virginia, or "if it can be legally done," from "so much of these States as lies east of the Alleghany Mountains." In order to prevent the hardship that would be caused by interference with the sale of calves of Eastern pure-bred herds, it is proposed that cattle from infected States may be admitted on the certificate of the State Veterinarian that the herd and district from which they came have been free from contagious pleuro pneumonia for at least the last six months.

We commented on this as follows:

"All reports of past investigations of pleuro pneumonia in the above infected States go to prove that when most prevalent it was confined to very limited districts; that its area has been greatly restricted, and that it has not been nearly so contagious as the European type. While very anxious—as our record amply demonstrates—that all needed measures should be taken to prevent danger from this fatal disease to the vast herds of the West, it seems to us that the proposed measure is a trifle too sweeping in its nature. Before the appointment of the Commission we would have made no objection to its adoption: but we had hopes that the investigations of this body would have discovered some less sweeping means of effecting the object."

Having been accused by the Chicago Tribune of personal feeling in our remarks in the above article, we disclaimed any feeling of the sort in an editorial in the RURAL for October 22, still further emphasizing our objections to the proposed Western general embargo on cattle from the above States. After stating our reasons for believing that the cases of the disease were few and far between within their borders, we said:

"If the disease is so prevalent in the Atlantic States as to justify such a sweeping measure as that recommended by the Commissioners, in justice to the farmers of the country these gentlemen should specify the places in which it prevails. Isolate affected herds or even sections rigorously; but for the sake of a sick cow or two at long intervals is it necessary or just to quarantine all the herds of so vast a territory? The Western herds must be protected at any cost, but justice and expediency demand that the cost should be made as light as possible to the stock-owners of the East who wish to sell their cattle, and to those of the West who wish to buy them."

It will be seen that if in that "Brevity" we were wrong in our statement of the recommendations made at *first* by the Commissioners to Governor Cullom, we had only repeated what we had said much more prominently nearly two months before and again a month later, so that the correction of our error was a long time coming.

But were we in error? Did we make a misstatement? On September 11, a special dispatch from Springfield, Illinois, the political capital, to the Chicago Tribune, gave eight points urged on the Governor by the Commissioners. The first six of these stated briefly the reasons for the seventh and eighth, which are the first published recommendations of the Commissioners. The seventh, which alone bears on the question, says:

"The State law empowering the Governor to schedule infected States and districts and debar all cattle drawn from such districts from entering Illinois, seems especially adapted to meet the present emergency, and the Commissioners believe that the Governor would confer a priceless boon on the West, and indirectly on the whole United States, in scheduling the States of New York, New Jersey, Pennsylvania, Maryland, Delaware and Virginia, or, if it can be legally done, so much of those States as lies east of the Alleghany Mountains. The great objection to such action, say the Commissioners, is that it would intefere with the sale of breeding-stock from the thoroughbred herds of the infected districts. To obviate such a hardship, they suggest that the provision need not be made absolute, but that provision might be made for the admission of cattle from the scheduled States on the certificate of the State Veterinarian that to his personal knowledge the herd and district from which they come have been free from contagious pleuro-pneumonia for the six months last past."

Our readers will see that in our article of September 24, in stating the gist of this recommendation, we adhered closely to the "wording" of it. A glance at the proclamation of Governor Cullom, given in full on Page 772 of the RURAL, shows that instead of scheduling the entire STATES as above recommended, he has scheduled only a few counties in each: and that instead of the State Veterinarian's certificate being needed to admit cattle from any part of the State, the certificate of a duly authorized veterinarian alone is needed to admit cattle from any part of the scheduled counties, while those from the rest of the State are admitted without any restriction or trouble.

But perhaps the dispatch of September 11 to the Chicago Tribune did not truly represent the suggestions of the Commissioners to the Governor? Inasmuch as Mr. Sanders is a resident of Chicago and an editor, to boot, it seems hardly possible that he could have failed to see this dispatch in one of Chicago's principal papers, especially as it professed to give the opinions of the Commission of which he was a member. Having seen the dispatch, if it misrepresented the suggestions of the Commissioners, it seems to us he would certainly have corrected the misrepresentation there prominently spread abroad, inasmuch as after this long interval he has thought it worth while to correct our statement in the matter founded on that dispatch and the general tone of the Western press in discussing the embargo. Since the receipt of Mr. Sanders's note, we have carefully looked over files of the daily and weekly Chicago Tribune from the date of the dispatch, but in neither have we been able to find any correction of it. If we have done an injustice to the Commission it has certainly been involuntary on our part, and the members themselves are more to blame for it than we, through their neglect to correct the first misrepresentation—but have we done an injustice?

BREVITIES.

WHY are farmers so negligent as to providing themselves with strong, warm mittens or gloves for Winter?

WE particularly call attention to Dr. Hoskins's article upon Apples Suited to Northern States. We receive many inquiries from Minnesota, Wisconsin, etc., which this article fully answers.

THE RURAL will be sent to new subscribers from now until January 1, 1883, for $2; that is the balance of this year free. The RURAL NEW-YORKER has no club or second price. It is the same to all.

WE are sorry to see the title of the Journal of the American Agricultural Association is to be changed to the Agricultural Quarterly and Journal of the A. A. A. The title was good enough and long enough.

PROF. BLOUNT, of Colorado, expresses his thanks in kindly words for the little present sent to him by the RURAL for his premium wheat heads. Prof. Blount is doing right good work, and we wish him a happy, long life.

THE INSECT recently received from a subscriber, and described as infesting peach trees, is a new species. It has been forwarded to an eminent entomologist, who is devoting special attention to these wood-boring species of insects. We shall give a full description of it soon.

"WE WISH you could impress on all your readers the great importance of putting the names of their post-office, county and State *clearly* on all their letters," write our friends, J. A. Field & Co., of St. Louis, Mo. "Every day we have to throw aside letters that we would gladly answer but for our inability to ascertain the address, or, sometimes, to read the names of the writers," and several instances are given. As our readers are aware from our previous cautions, carelessness about writing the name and address clearly on each letter is a frequent source of inconvenience to us and of delay to our friends in getting the paper for which they have subscribed or the answer for which they have written. This very morning a letter has come from "Fulton," the name of the State being omitted. Now there are 17 Fultons in as many different States—from which of them has this letter come? Unfortunately the post-mark on the envelope is too indistinct to give a clue.

Miscellaneous.

A NEW DEPARTURE.

Sketch of the Scenery, Products, Towns, etc., Along the Line of the St. Paul and Duluth Railroad.

MESSRS. HOLMES AND SWEETLAND.

[Special Correspondents of the RURAL NEW-YORKER.]

THE pencil of the traveling correspondent must, perforce, be even more versatile than the brush of the artist, describing, as it does, successively the plain, prairie, timbered region and craggy cliffs, the culture of corn, of flax, then, per chance, comes a chapter on wheat, followed by others on stock raising and kindred interests.

Those who know casually of the country traversed by the St. Paul and Duluth Railroad, know that, instead of the prairie common to other roads, it penetrates the extensive forests of White Pine and numerous groves of maple, oak, ash, elm, butternut and other hard woods lying in Northeastern Minnesota. "What is this country good for outside of its timber?" has been a question often asked, to answer which we made a trip of the entire line, stopping at all of the principal points.

First we found that these lands are not entirely covered with timber, but in places interspersed with natural meadows upon which the growth of grasses is abundant. It has been often said that it is with the greatest difficulty you can induce a farmer who has been used to a timbered farm in the East, to take a prairie farm in the West and *vice versa*; for every man who has tilled a cleared farm knows the difference in soil, which can be found there, the rich deposits of ages the accretions of time as the winds of each succeeding Autumn sweep the leaves from their parent stem, to become another stratum in the rich soil beneath them. While that difference does not exist in as great measure in the Northwest as in some other localities, it is equally true that it does exist, even here, as those who have cleared and cultivated farms can attest. Greater labor and more time are, of course, required to grub, clear, break and reduce to use timbered lands than to break prairie lands; but in selling these lands the owners (the Railroad Land Company) agree to purchase all the ties, piles, cord wood, etc., that may be cut from lands which may be cleared and cultivated; if one-fourth to one-half of the purchase is so cleared within four years they will also allow a rebate which will reduce the price to $1 per acre for the entire tract.

The farms in this region, although perhaps nearly as numerous as in the northwestern portion of the State, are none of them as large owing in a great extent to the labor and time required to place the land in condition to yield its first crop. However, from those who raised crops we learned that wheat did remarkably well this year, most of it ranging "No. 1 Hard" and with full heads, a good stand, and abundant yield. Oats, barley and rye did well, and in root crops, and especially potatoes, there has been a large yield of a very superior quality. Many of the farmers have wisely added to their other interests a little stock which, from the excellent grazing in Summer and ample protection in Winter, seem to do surprisingly well.

The Railroad Company have had for two years an experimental stock farm at Mahtowa, 36 miles from Duluth. The clearing is about 800 acres, with good fences, barns, dwellings, etc. They have about 100 Short-horns and grades, also herds of Berkshire, Poland-China and Chester White hogs and a flock of Lincoln sheep. As L. M. Ford, Esq., the former agricultural editor of the Pioneer-Press, is good authority, allow us one quotation from his able pen: "This same region will become celebrated some day for stock and dairy business. This opinion is based upon, the fact that, in spite of the large amount of apparently waste land there are thousands of the best natural meadows ever seen in any country. * * * The amount of pasturage is enormous, while every one has conceded that as for pure water for stock, no part of the world could be more favorably situated. * * * There is another advantage that Prof. Riley, of the National Entomological Commission claims for this part of the Northwest; viz., that the omniverous Caloptenus spretus (the Rocky Mountain Grasshopper) will never extend his ravages more than ten miles east of St. Paul."

The prices of lands in this region vary from $2.50 to $6.00 per acre, according to quality, location and character of the timber, and it is not now the labor of a life time to grub out the stumps of a forty-acre farm, as the improvements made in stump pullers have simplified the work to a great extent.

We were very much interested in noting the wonderful water power at the town of Thomson, where the railroad crosses the St. Louis River. Inquiry elicited the fac s that the minimum flow of water is about 2,500 cubic feet per second, the falls extending for a distance of 4½ miles, with a fall of 400 feet, rendering a power obtainable of 113,000 horses. Within the limit of the town site (about a mile) the fall is 80 feet, giving about 17,000 available horse power, or nearly twice that of Lowell, Mass. We may in a future letter give a detailed review of this power. The river for many miles above and below the town flows through a solid bed of slate rock of great depth, which neither time nor tide will ever wear away. All around these lakes and rivers is a "sportsman's paradise," there being, in season, abundance of geese, ducks and chickens with sometimes deer and bear. In regard to markets for grain and stock, farmers have a double advantage with Duluth (via the Great Lakes to Chicago and New York) on one side and St. Paul and Minneapolis on the other. Successful experiments have been made in growing apples, pears, plums and small fruits, and there is no question that for one who understands it, it would prove in this section a profitable pursuit.

The great interest of the entire region now, and for some years to come, is lumber. We did not see a town without a saw-mill and learned of many of notable importance a short distance off the line of road. At Knife Fall there is a superior water power and two of the largest saw-mills in the States. It is estimated that the pine timber on the river St. Louis and its tributaries exceeds 2,000,000,000 feet. There are 70,000,000 feet of lumber tributary to Barnum, and the immense amount of pine lumber transported by the St. Paul and Duluth R. R. testifies that the demand is still greater than the supply. After reaching the St. Louis, crossing its bubbling, boiling tide, hugging the hills and bluffs, the train speeds through "the Dalles," unfolding in its rapid flight down a grade of 600 feet in ten miles a panoramic scene of beauty, especially gorgeous when viewed resplendent in the rays of the rising or setting sun.

The waters of the swiftly-running stream, rock-encompassed, and thus compelled to leap in sportive glee from crag to crag, foaming and boiling in mad rivalry, with each and every wavelet crested with the purest *amber*, form an unusually beautiful sight. Yes! owing to the abundance of red clay, which is stiff and marly, intermixed with sand, the waters are positively red, the peculiarity extending far into the lake which receives the stream a few miles further down.

Duluth is the northern terminus of the road. It is known as the "Zenith City," and is the head of navigation for Lake Superior. Consequent upon this fact the grain receipts are enormous Elevator A, capacity 500,000 bushels, shipped last year over 2,000,000 bushels of wheat. Elevator B, capacity 1,000,000 bushels, shipped in the year ending October 1st, 1,925,289 bushels. Besides these elevators a new store-house of 1,100,000 bushels' capacity is being erected west of Elevator B.

Five steamboat lines are running in these waters, probably 60 boats, passenger and freight, which carry to Eastern markets grain, hides, furs, etc. (the latter from the Yellowstone country), and bring in coal, iron and merchandise. The Duluth Iron Co. has a blast furnace manufacturing pig iron only, bringing ore from Marquette and L'Anse, shipping to eastern and southern markets. Nothing but charcoal is used for fuel, turning out over 30 tons per day. There is an ore deposit about 80 miles north of Duluth, to which we learn a railway will be built next year. Besides the interests mentioned there are extensive lumber mills and trade, while the general business of this pretty city is excellent. There are several handsome business blocks and a general spirit of activity, enterprise and desire for improvement and progression. Along the line we made brief stops at Rush City and Pine City, both thriving towns, and White Bear Lake, Taylor's Falls and Center City having acquired much favor as resorts, especially the former, situated, as it is, within 12 miles of St. Paul, replete with good hotels, sail and row boats, a steamer or two, and having a reputation for beauty and excellent sporting second to none. St. Paul people are especially interested in the welfare of this convenient resort, as it is the nearest to their city, and are giving it each year an increased patronage. We gladly acknowledge courteous suggestions from J. G. Callahan, Land Commissioner, St. Paul, which rendered our trip far more pleasurable than it would otherwise have been.

BON SILENE ROSE.—FIG. 541.

Floricultural.

BON SILENE.

THE tea roses are not as a class so brilliant in color, so large or "double" as those known as hybrid perpetuals; neither will they endure so much cold. But in fragance and beauty of buds they are surpassed by none. They bloom profusely during the entire season until frost. Bon Silene, the subject of the accompanying sketch, is of a deep rose color, varying sometimes to a rosy crimson or to paler shades. It is justly esteemed for the great size and beauty of its buds which render them especially valuable for bouquets or personal ornament. The American Banner Rose is, we believe, a sport of Bon Silene the buds of which, though small, are striped with red upon a white ground.

THE GREAT CHICAGO FAT STOCK SHOW.

[RURAL Special Report.]

THE Chicago Fat Stock Show, which opened here on January 7 and closed on January 14, bids fair soon to eclipse its great English prototype, the Smithfield Fat Stock Show, held annually in London, a little before Christmas. This Western exhibition was inaugurated only four years ago, and already it has attained vast proportions and become an important and exciting event to stock owners not in Illinois alone, but throughout the whole West, and, indeed, throughout the whole Union. There is no doubt that the keen competition between the adherents of the various breeds of stock and the lessons annually taught by the results of the show have had a great influence in stimulating improvement in all classes of domestic animals exhibited and in fitting them for human food in the most expeditious and economical manner. To this show the most skillful and successful stock breeders and owners within a radius of a thousand miles bring their choicest animals for exhibition. Here people have a yearly opportunity of judging for themselves which class of stock pays best as meat animals, for the primary object of a fat stock show is to determine this question. Exhibitions of breeding stock and of cows for dairy purposes, are excellent in themselves, but these have no place in a fat stock show, for to fatten breeding animals or dairy cows is to greatly lessen their value for the special purposes for which they are intended. It is the "meat" breeds, therefore, that make up the vast bulk of the exhibits here and it is the rivalry between these in early maturity and rapid as well as economical fattening that excites most interest.

In the cattle department there were 148 entries—considerably more than in any previous year. Of these there were 16 Short-horns shown by seven exhibitors, and 86 Short-horn grades by 12 exhibitors; 15 Herefords by four exhibitors, and 15 Hereford grades by three exhibitors; 8 Devons by one exhibitor, and two Devon grades and a single Ayrshire steer named Jack, from the Illinois Industrial University. Jack was 1,094 days old and weighed 1,305 pounds, averaging a gain of 1.20 pound a day since birth, and the Devon grades were 987 and 917 days old, and gained respectively 1.33 and 1.22 pounds per day since birth. While the entries greatly outnumbered those of last year, there was also a marked improvement in the quality as shown by "handling" and general appearance. The excellent character of the Herefords and the comparatively large number on exhibition as compared with former years, attracted a great deal of favorable comment upon the skill and enterprise of those pushing this fine breed; while the very large number of excellent Short-horns engaged general admiration. The main interest in the cattle department of the exhibition lay in the rivalry between these two breeds, and between the Short-horn and Hereford grades even more than between the pure-breds. The reason for this is readily understood when we consider that the chief use of both these pure breeds in the West is to grade up the common native stock, and, of course, the adherents of each are especially anxious to show that their favorites are pre-eminent for this object. In view of the fact that the Short-horn grades were upwards of five times as numerous as their Hereford competitors, and that, therefore, they had more than five times their chances of carrying off the laurels, honors were pretty evenly divided between them. It is true a Short-horn grade took the sweepstakes prizes both for the best three year old steer and the best steer in the show, but there were hundreds of disinterested spectators who strongly reprobated the manner in which the latter prize was awarded.

The age in days, the weight, and the average gain in pounds per day since birth were given with regard to each head of stock, but the RURAL will probably have room for only a few specimens; accordingly I send these particulars of the prize winners alone:

Prem.	Breed	Name of animal	Age in days Nov. 4.	Weight Nov. 4.	Average gain per day since birth in lbs.	Exhibitor.
(2)	Short-horn	Muir	1085	1895	1.75	Morrow & Muir.
(3)	Hereford "	Airdrie Boy	1055	1-55	1.56	Dunlap Bros.
(2)	Devon "	Will Washington	1224	1965	1.60	T. L. Miller.
(3)	Short-horn "	Jerry	1242	1931	1.55	"
(2)	" Grade "	Tom	882	1020	1.16	L. Rawson.
(3)	Hereford "	Morris	969	975	1.00	"
(2)	Short horn "	Boynton	1,362	2200	1.62	John B. Sherman.
(3)	"	Red Lord	1,389	2150	1.55	"
(3)	"	Oakley	1,047	1765	1.68	T. W. Hunt.
(3)	"	Kansas	1,064	1755	1.65	"
(3)	"	Conqueror	1,054	1925	1.82	J. D. Gillett.
(3)	"	Talbot	1,190	2175	1.82	T. L. Miller.
(3)	"	Major	1,321	2075	1.57	"
(3)	"	Washington	719	1563	2.10	Morrow & Muir.
(3)	"		629	1250	2.01	J. H. Potts & Son.
						T. W. Hunt.

The sweepstakes prize for the best 2-y'r-old steer in the show was awarded to the grade Short-horn steer McMullen 1,237 days old, weighing 2,095, averaging a gain of 61 pounds a day since birth. His chief competitor was the Hereford grade Conqueror who, the day before, after a very protracted discussion and the summoning of three extra judges, had been awarded the first premium against McMullen among others.

On the following day Nov. 11, McMullen again bore off the highest honor of the show—the sweepstakes prize for the best steer of any age in the show. The Awarding Committee in this contest were T. Erwin, Bloomington, Ill., J. W. Dunn, Peoria, Ill., F. Gertiser, Springfield, Ill., James Pletz, Polo, Ill., and H. A. Heinemann, Bellville, Ill. Of these five the three first, constituting a majority of the committee, had also been among the judges who awarded the three year-old sweepstakes prize to McMullen the day before, and very properly, I think with all fair-minded visitors, the Hereford men at first refused to take their cattle into the ring, on the ground that it was manifestly unjust to allow the men who had acted in the ring the previous day when the same cattle were exhibited, to pass judgment now upon their judgment of the day before. After deliberation, however the Hereford men completed the ring, and of course, the prize was awarded to McMullen. Under the circumstances no other decision was possible; to award the blue ribbon to any other animal would be for the majority of the committee to stultify themselves. The Hereford men, of course, are loud in their complaints of unfairness, and for one, I agree with them. That the Short-horn influence should have recourse to such trickery looks very much as if the Short men were not tally afraid the chief honor of the show would have been awarded to their rivals by an impartial committee. It is ridiculous to insist on the uprightness and honor of the judges who consented to serve on both days—no man of a nice sense of honor would have done so under the circumstances and against the earnest protest of the Hereford men, and to make a righteous decision in such a case a nice sense of honor is essential.

H. W.

For Women.

CONDUCTED BY MISS RAY CLARK.

DESCRIPTION OF CUTS.

FIG. 534—AFTERNOON-DRESS.

The polonaise is of copper-red cashmere; the skirt, cuffs, and sachet are of stamped velvet of a darker shade; the scarf, draped

FIG. 534.

crosswise over the front of the skirt, is of surah, a kilting of which is placed under the skirt at the bottom, just showing under a kilting of lace.

FIG. 535.—WALKING-DRESS FOR LITTLE GIRL FROM SIX TO EIGHT YEARS OLD.

The dress is of light-brown cashmere, with a scarf and collar of shaded blue and brown striped material. A Mother Hubbard bonnet of brown cashmere, trimmed with kiltings; bows and strings of blue ribbon is suitable to be worn with the dress.

FIG. 540.—FLOWER-POT WITH COVER, ORNAMENTED WITH EMBROIDERY.

The framework of the cover is of bamboo, lined with crimson cloth; it is ornamented with a drape of olive-green cloth which is shown in the cut; it is pinked at the edge;

FIG. 535.

the embroidery is worked in chain and long stitches with crimson and two shades of olive silk. A tassel of wool ornaments the drape between each section.

FIG. 536.—SPRAY EMBROIDERY.

This spray is for disposing at intervals on flounces, drapes of dresses, &c.; chain, cording, coral, long and lace stitches, are employed in the design.

FIGS. 537 & 538.—Design in satin and long stitch.

FIG. 539.—Design in embroidery in satin and knot stitches.

TABLE ETIQUETTE.

"It is manners that win" respect for the lowest as well as the highest. In my opinion "manners" at the table, is one of, if not *the* leading point of etiquette to be observed.

FIG. 536.

Some people eat too rapidly, either for health or manners while some eat so slowly as to appear ridiculous. While some eat *too much* for health or manners, others pick at their food as daintily as birds. Of course there are some whose appetites are poor, and who make an appearance of eating, but I have seen young girls—plump, rosy, robust creatures, who in company would not eat enough to keep a cat alive. I once visited a family in which were two girls answering this description. I had dined and supped with them, but never in their own house. I had often smiled at their dainty appetites, so at variance with their plump bodies and rosy cheeks, and thought I should see some hearty eating at their own table, but really, I nearly starved during the few days I spent with them. They rarely ate a whole biscuit at a time and partook of other things in accordance, and I was ashamed to satisfy my hunger before them. At the end of my visit with them, one of the girls accompanied me to visit some mutual friends, and I was so amazed that I scarcely ate any myself, to see that girl eat, after the first meal.

It is really absurd to see a stout, healthy person sit down to a well-supplied table and eat esthetically. On the other hand it is not exactly absurd, but rather disgusting to refined tastes to see a person eat with such gusto so greedily and rapidly. One thing I have noticed, is, that many persons who have excellent table manners, will *make faces* every time food is conveyed into their mouths. I have often been amused at the ugly contortions of face practiced by some people—people who would have been dreadfully mortified had they realized what they did.

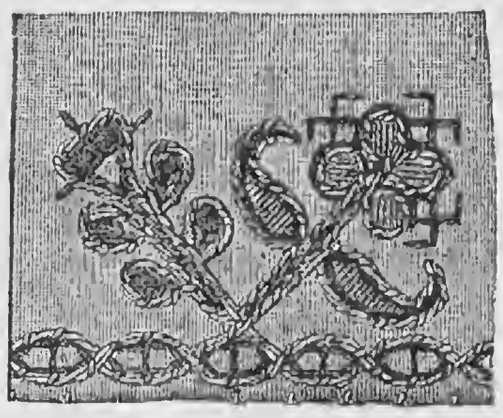

FIG. 537.

Mrs. Mary Wager-Fisher, gave some excellent hints and advice upon "Table Etiquette," a few months ago, but I noticed that several persons were disposed to criticise and question the sensibleness and practicability of certain points such as conveying the food to the mouth with the fork instead of the knife, drinking tea and coffee from the cup instead of the saucer, etc. Now, all these things have been sanctioned and adopted by people of refinement and education and have become immutable laws, and there is no use nor need of rebellion, for society will frown you down and your punishment is swift and sure, if you break these laws.

To a man who lives on a farm, remote from city, or town, these things seem silly and absurd, and he goes all his days, the same old way, scorning the new, eats with his arms akimbo, conveys his food to his mouth on his knife, drinks his tea and coffee from his saucer, and makes a loud, sucking sound in so doing. Dips his own knife into the butter and wipes his mouth on his handkerchief, the back of his hand, or perhaps on his sleeve. Of course the children, having no other example, do the same things; some of them after awhile are drifted into quite another sphere of life, there to be greatly mortified at their own ungraceful manners, and lose some of the respect they entertained for "Father and Mother," who taught them their ill-manners.

Nothing that tends to refine mankind, is senseless or useless. MRS. W. V. A.

EMBROIDERY OF THE MIDDLE AGES.

FROM the earliest times embroidery and fine needlework have been the occupation and amusement of women. We are told by William of Malmesbury that Saint Dunstan in his younger days assisted a noble lady in drawing a design for embroidering a Sacerdotal robe. The four daughters of Edward the Elder, also the sisters of King Athelstan, were distinguished on account of their great skill in spinning, weaving, and embroidery. In the tenth century, Elfrida, widow of the Duke of Northumberland, presented to the church of Ely, a curtain or veil on which she had worked the figure of the deceased Duke. Witlof, King of Mercia, presented to the Abbey of Croyland a golden curtain embroidered with the siege of Troy.

FIG. 538.

After the fall of the Roman Empire the art of tapestry-work appears to have been lost in Europe. It was again introduced from the Levant by the Crusaders. The celebrated needlework of Bayeux is supposed to have been the work of the Norman Matilda, the Queen of William the Conqueror, and her handmaids. It was presented to the Cathedral of Bayeux in Normandy, where it was sometimes exhibited. It was a continuous web of cloth, two hundred and twenty-seven feet in length, and twenty inches in width, including the border V. at the top and bottom. It represents the invasion and conquest of England by the Normans. It has five hundred and fifty figures in it.

It is most amusing to know that, owing to the period at which it was worked, the colors in which it is executed were of a most motley description, consisting of dark and light blue, green, red, yellow and buff. The skies were nearly always represented as blue or grey or brown; any foliage that was wrought in was generally green; but no attention at all was paid to the colors of the horses. They were veritable patchwork, as, for instance, a red horse had two blue and two buff legs, and a green or yellow mane. The hoofs of the horses were also worked of still another color. The faces of the figures are of the cloth the tapestry was worked on, the outline of the features being worked in tent-stitch or chain-stitch with any odd color that came the most readily to the hands of the fair lady at work on it. The borders of the tapestries were formed by a representation of the slain at the battle of Hastings, laid lengthways one after the other. It is said, nevertheless, that faded as this work now is, it excites great admiration at the industry that

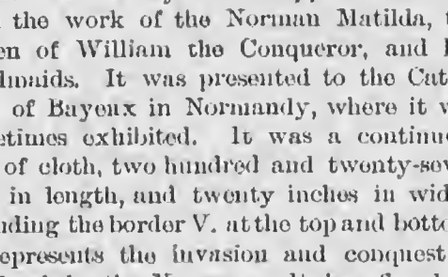

FIG. 539.

could chronicle by the aid of the needle such a series of events in history. Next to the work of Queen Matilda came that of Adelais, the daughter of Godfrey, Duke of Lorraine. Especial mention is made of a magnificent standard embroidered by her, and which was carried at the head of the army.

The first Queen of Henry VIII., Katharine of Arragon, gave all her leisure hours to embroidery. Shakespeare, in the 3rd Act of "Henry VIII.," represents Katherine at needlework with her women. Lady Jane Grey was a proficient in beautiful needlework. Anne Boleyn, educated at the Court of Francis I., devoted much of her time to tapestry work. Of the work of Queen Mary no traces are to be found. Queen Elizabeth was highly extolled for her needlework. In the Bodleian Library, at Oxford, may still be found a copy of the Epistles of St. Paul, the binding of which was worked in embroidery by the Queen when a Princess. Mary Stuart Queen of France and of Scotland, found tapestry-work a great resource, both in her happier days and during her imprisonments. Several pieces of the work of this most beautiful and accomplished Queen are still preserved. At Allanton House was formerly a splendid bed embroidered by her and her ladies. This was unfortunately burnt up by an accidental fire.

At Holyrood Palace in her chamber is shown a box covered with her embroidery. Other pieces of her work are preserved in the castles of some of the nobility of Scotland.

CORRESPONDENT'S CORNER.

TO COVER SLATE FRAMES WITH FLANNEL.—Noticing an inquiry "How to cover slate frames with flannel," I thought I would send my way.

The object is to avoid the noise made by sloving slates on the school desks. I have seen slates with little knobs like buttons on the corners of the frame; these worked very well. In the absence of these, flannel covers can be used. With a gimblet, bore two holes on each corner of the frame, cut the flannel in strips to fit the frame nicely on both sides, then slip a darning needle and some twine through the two holes so that the twine will reach, slanting, across the cloth. Tie the ends of the twine securely. Make another hole half way between, slip the needle through that and tie on the outside. The corners may be sewed neatly down with a needle and thread, but the covers will not stand school children's usage unless fastened on in the way above stated. Tacks would scratch a desk.

AUNT RACHEL.

Literary.

THORNS AND ROSES.

CHAPTER VIII.

(Continued from page 786.)

"Let us turn this way, Kate, and through that field!" he said.

And then I remembered that Brandon would never listen to his own praises,

FIG. 540.

"I have something to tell you," I said.

And he looked at me, smiling.

"Is it what Nevil told me last night? Then dear Kate, I congratulate you."

"Oh! Brandon, I am so happy!" I cried for seeing his kind face, I felt that I could speak more freely to him than to any other.

"I am so glad! How strange it seems for little Kate to be engaged!"

"I am little Kate no longer, brother!"

"I shall always think of you as my little companion, though. I pray that the future may be full of blessings for you two and as happy as the present."

"And now there is something else I must say to you, Brandon," I continued, letting the reins fall and stroking Diamond's mane.

"Yes!"

A certain eagerness in his eye struck me, but his glance fell beneath mine.

"Perhaps it will pain you, perhaps vex you, perhaps it is one of my foolish fancies."

"Perhaps you will tell me, and then I can judge. Be frank and fearless, and don't spare me."

"Dear Brandon, it is so selfish of me! But to speak with you will help me. Contrast our past with our present, and you may see what I mean; we are not to each other what I had hoped; I can't explain myself very clearly, but it is as though something had risen between us—a shade of I know not what. We have been apart for long; you are full of self-reliance, wise and firm, and so I would have you; but there is some restraint that I can't define!"

"Am I cold or unkind?"

"You could not be. But you are more reserved—no, I cannot explain myself; but tell me, dear, is it my imagination, or is there a shadow?"

He was silent a long time, and I thought he was pale and cold, as he gazed before him still and motionless; but he turned to me at length, laying his hand on my arm.

"I understand you perfectly; I know well what you mean; we are to each other distant relatives—not the brother and sister we once were. In old days we had no secrets from each other; you knew my every thought, and I knew yours; there was no trivial act of mine of which you did not hear; no fancy crossing my brain that you did not know; no dream in which you did not share; and now—even from you—I have my secrets."

"I did not mean that; it would be unjust as well as foolish to expect that you should tell me everything, Brandon!"

"Well, if there be a shade between us, Kate, it is through me it comes, not through you. I say if—not that there is. Since old days many things have happened; there have been clouds on my way that can never, that will never be yours; but shade or no shade, be assured of this, that in me you have a sincere and devoted friend. Do not fear speaking openly to me, even though I am reserved with you. Ah, my sister, it is better so!—how much better you will never know! I have had thoughts and visions that no one could share; I have my secrets! You are open as the day to me; I cannot be the same to you! Yes, I admit it; we are not now as we once were, and why we are not is better left unsaid; the change is not with you, but with myself. But you are ever dear to me, you ever will be—and you will believe that!"

"Oh! dear brother," I said, looking into his grave, earnest face, "there is no shadow, save what my own exacting spirit created."

He sighed faintly, but soon relapsed into his own composed manner.

"Come, Kate, no more sadness! We understand each other, my child. Now, tell me about Nevil."

CHAPTER IX.

The early Spring sunshine was wooing back to life the leaves and flowers. Winter had brought no changes to me; but I had now a new interest in life. Its hours were brighter, and filled with a deeper happiness than I had ever before known, for had I not Nevil's love? We two lived for each other. He was almost every evening at Lovel House, and in my rides and walks I was certain to meet him; and we galloped together over the moor or strolled through the lanes, "thinking and talking no doubt of the weather." It was strange to look back on the time when I had not known him or even heard his name, and now he filled the first place in my heart. He was devotion itself, and I found nothing in him that could change my love.

But when I tried to read my own character and to know myself, I wondered how it was that he could love me. Surely I was the most selfish, discontented and exacting girl on earth. I had Brandon's true affection, yet had found fault with it; and now, having this love—the crown of all humanity, the love that should fill life so full of joy and gratitude that no space be left for discontent—even with this I was seeking for something not yet mine—something more beautiful, without which life was incomplete. It was wicked ingratitude, I know, and I kept these vague longings, these unsatisfied desires, to myself. Nevil apparently had no such thoughts as these, and with all my faults I loved him. Where was the selfishness, the inconstancy of which my cousin had accused him?

Edith was yet with us; and since my engagement to Nevil she had not spoken of him, either in praise or disparagement, but rather avoided mentioning him at all. When he was present, it was as if she thought it too much trouble to notice him, and carelessly overlooked him. When he addressed her, she would reply with some sarcasm, and ere he could return it, become absorbed in her book, or aunt, or Brandon. Nevil looked at her curiously sometimes, as though inclined to be annoyed. But whether he sang or talked; whether he read Tennyson, or watched me sketch; whether he stood or sat beside me, her eyes rested on us with a gaze expressing literally nothing—neither interest, sympathy, nor scorn. She was a perfect enigma; Nevil said little about her to me, but he did not seem to like her any better than she liked him.

Mr. Edgar Dana visited us frequently, still retaining his place in aunt Dorothy's favor; and Edith treated him with sublime patronage; not the patronage of a superior to an inferior, but that which she would have bestowed on a school-boy, and received his homage with amused good temper. Beside her, in many things, he was a boy; and "had he but loved with a boyish love," it would have been a great deal better for him. His was a simple nature: but the stream was not so shallow as I had once thought; there were depths of passion in it which my cousin had not fathomed. Of whom did Mr. Dana make a friend but myself? and why I did not know, for I had hoped he would choose Brandon. I always tried to put him at his ease, and do any little kindness that came in my way, but certainly I had not expected him to make me his confidant, and lay the secrets of his mind before me; however, he did, and had told me of his love for Edith, of the old happy days, of the change in his fortunes, and had ended by declaring that he would win her yet. In vain I shook my head at this; with a boy's eagerness, and a man's passion, he would argue against me, always convincing himself.

This Spring evening he had called at Lovel House, and meeting me in the garden had stopped to speak; as usual, he began about Edith and old days.

"Dear Miss Lovel," he said, "I can't feel discouraged despite your arguments, for Edith loved me long ago, and though my fortunes changed, she will not!"

"You forget her relatives. You love her, and say you will win her. All her life she has been accustomed to wealth and luxury, and you can't give her these. Would you offer poverty?"

"Poverty! Ah, you are right! I am utterly beneath her—I can scarcely support myself—my life from day to day is a struggle—I have neither wealth nor position—and her friends are proud and high! But I can't crush my love; we were equals once, and I forget the change! She loves me I know! When I think of the past—when life looked fair and bright—when I had the right to call her mine—when friends smiled on us—ah, I can't help loving her as I did then, though now it is madness! Will you advise me?"

"The best advice I could give you," I said, "is—don't come here. It is the old fable of the moth and the candle over again."

"To be near her is my one glimpse of sunlight, and I can't shut it out, poor weak idiot as I am! And yet if to-morrow she would be my wife, I would not, in my present poverty, ask her; I love her too dearly to let her sacrifice herself! Yes, if I were brought to that test, I think I should stand it! You are the only one to whom I can say these things, and it is good to speak to you, though you are hard on me sometimes. Oh, if my poor old guardian had left a will how different all might have been!"

"He would have made you his heir?"

"Yes, I think so; but his illness and death were sudden, his affairs unsettled. He was very good to me, and provided for mamma—for my mother—until she died. He sent me to college, and then the Dana's offered me a home with them. He consented, and so I saw but little of my guardian.

I was with him when he took the fever that ended his life. After his death no will was found, his next of kin stepped into the property, and I was penniless and friendless. He had been very wealthy, too. A doctor in good practice, unmarried, and with simple tastes, he had saved a good deal."

"Who was he?" I asked.

"He was Dr. Lorimer."

"Dr. Lorimer! Why, Dr. Lorimer was a friend of my father's! What a singular coincidence! He was a great friend of Brandon's father, too!"

"Yes," returned Mr. Dana, very quietly. "It is not many years since he died."

"It cannot be, because he attended Brandon's father and was present at the funeral. How strange we did not know he was your guardian!"

"There was no necessity for my mentioning it—but there is something I want to tell you—a special favor I would ask."

"I will grant it if I can."

"You know that the one hope of my life is to win Edith. I would not offer her poverty, and I must first gain wealth and fame. I have much time on my hands, and sometimes I sit up at night working at this."

He produced a roll of manuscript, coloring as he did so, his hand trembling."

"I wrote—I have tried to write—a play, Miss Lovel, and hope to have it produced. What I want to ask is, that you would read it and give me your opinion. It may succeed, and there is fame."

The boy's dream was so wild that I looked at him in pity and wonder, saying:

"Do not build your hopes on this. Remember how many have failed before you."

"Those who failed had no Edith to win. I must succeed, Miss Lovel," he said, flushing again. "I know I have talent, and writing verses and dramatic scenes was always my favorite occupation. Now, if my play is accepted, and is successful, even my relatives would be pleased and proud of my fame. A friend of mine has promised to use his influence with the manager of the Prince's, so success is almost certain; but I may be too partial to my own work and blind to its defects, and thus I ask you to read it."

"I am willing to do so, and shall give a frank opinion, but I fear you rate my judgment to highly."

"But I fear you are hoping too much; even if this succeeds, how do you know that Edith either can or will wait, for some time must elapse ere you know if it be a success."

The sunny light left his eyes, and his head drooped; he saw as well as I did the fallacy of his hopes, yet he tried to shut out the vision.

"Do you believe in truth and fidelity?" he cried, suddenly. "Edith did not, of her own free will, break the vows that bound her to me. She will be true to me; I would stake my life upon her constancy. May I go to her?"

"Certainly!" I said, for I had heard Nevil's step, and was eager to meet him.

Edgar went away, and Nevil joined me.

"What had Dana to say to you!" was almost his first question.

"Poor fellow, Nevil, he loves Edith."

"Isn't that rather presumptuous, Kate?"

"They were once engaged to each other, Nevil, and I suppose he cannot help it."

"There is such a difference in their positions," pursued Nevil, "and he ought to see it. However, it's not our affair. He makes you his confidant?"

"Yes, but I'm not a very encouraging one."

Nevil smiled, and turned the conversation.

"You have never yet said when you will really give yourself to me, Kate, and I want our marriage to be soon. Why not? I have surely waited long enough."

"We have not been very long engaged, Nevil."

"What matter? We know and understand each other, and, best of all, we love each other. What is it? You doubt me, after all."

"Oh, no, dearest Nevil! but marriage is so very serious. Suppose we did marry, and you discovered my bad qualities, if you were to regret that you had married me?"

"I never should, my love! Am I to go on waiting for ever? I can't. I want you for myself, and you say farewell to the old life, and begin the new with me. Now, say you will soon enter your new home."

To be Continued.

With boiling water, day by day.
Cleanse each with utmost care;
Then rear them at your doorway,
To dry in open air.
Twenty Golden Rules.

FACULTY IN HOUSEKEEPING.

ANNIE L. JACK.

THERE is no position in life that needs so much inventive and retentive faculty as in the many little trials and difficulties of housekeeping. If "order is Heaven's first law" it is also the law of Home. The place when nothing is to be found, the habit that is a series of careless acts; the uneven tenor of the ways of life, all conduce to make life what it ought not to be. Five times the amount of work can be done if there is a regular system in the doing, and any one who makes an apology for untidiness, ought to be aware of the fact that no housekeeper is blinded by it, for it is easy to understand that things can be more easily kept in place and less time be lost than is spent in the searching for and picking up, so prevalent in careless households. My boys have a very bad habit of laying down coat or hat wherever it may chance to happen. I endeavor to teach them that if each one would hang his hat on a nail, it would add to the tidiness of the room, and be less trouble to his sisters, while teaching the habit of "a place for everything." I know that natural characteristics have something to do with it, and that an innate neatness born in some children causes them to notice and care for their clothes more than others. But seeing the unhappiness caused by disorder in many families, I am forced to say that tidiness is a faculty that ought to be cultivated by every housekeeper and taught to her sons and daughters like every other lesson or training.

A woman has so much to do with a man's life, and can make home a paradise, or a foretaste of the most realistic inferno.

Regularity and routine are necessary parts of a housekeeper's duty, and in ordering a meal or cooking it, there is nothing that requires more faculty. Men know nothing of the many irons that have to be in the fire of the kitchen at once. A woman of faculty can manage them without trouble, but once let the machinery get in a muddle, the routine lag a little, and everything goes wrong, and viewing the matter from all stand-points, I am persuaded that there is more in faculty than in the manual labor—more than many women take the trouble to understand or demonstrate. A habit of order and looking ahead is of more value to children than half the education of the schools. It will give them a chance to get though life and miss many of its petty trials.

SETTING THE TABLE.

I was much pleased with Mary Wager-Fisher's article "Concerning the Table." It is true, as I well know from experience, that the best servants do not set a table properly. In fact, I dispensed with the servants' assistance entirely about my table, and performed that part of the work myself in order to avoid the jumping up for this and that while eating. But then, it is not always the domestics who are at fault, for the mistress and the "quick, bright farmers' daughters," however exact about other things, are often neglectful about this one matter. On some tables things are always lacking—a napkin, a fork or a spoon. Think of putting on one tablespoon for supper, when you know that two or three will be needed for the food which has been provided. And yet I know a lady (and she is not the only one I might mention) who does this invariably. She is neat, methodical, and an excellent cook, but her table is never set properly, and the *indispensable* table-ware is always in the closet. If one will only try she can easily remember the things which are needed for a meal, and so avoid the getting up (which is always unpleasant) for this and that which should have been on the table before the meal was served.

A FARMER'S DAUGHTER.

DOMESTIC RECIPES.

POTAO CAKES.

WORK cold mashed potatoes soft with a little milk and butter, knead in enough flour, with half a teaspoonful of baking powder sifted with it, to enable you to roll into a sheet half an inch thick. Cut into rounds and bake in a quick oven till well browned. Rub a little butter over each before taking out.

MACARONI.

Break half a pound of macaroni into inch lengths and boil in salted water until tender, but not broken. Put into a pudding dish, season with a large piece of butter, cover with grated cheese and set on the upper grate in the oven to brown. M. B.

QUAIL ON TOAST.

Dry-pick them, singe, cut off the heads, then the legs at first joint, split down back, draw, put into salt water for 15 minutes, drain, dry with a cloth, lard them with little pieces of bacon, and boil over a good fire. If one does not care for the bacon dip each into melted butter two or three times. Have ready as many slices of buttered toast as you have birds, and serve a bird breast up on each piece. Thin slices of broiled bacon are very good served with the quail. N. J.

FARMER'S FRUIT CAKE.

Soak three cups of dried apples over-night in warm water. Chop slightly in the morning and simmer two hours in two cups of molasses. Add two well-beaten eggs, one cup of sugar, one cup of butter, one dessert spoonful of soda, flour enough to make rather a stiff batter. Flavor with nutmeg and cinnamon to the taste. Bake in a quick oven.

TONIC.

The following is a very good medicine for old people or children when they are not feeling very well and their appetite fails: One ounce of valerian, one ounce of white root, one ounce of golden seal, one ounce of rhubarb. Get this pulverized and mixed at the druggist's. Put a teaspoonful into a teacup, fill the cup half full with sugar, then fill up with hot water. Let it settle. Take half of this at night and the other half in the morning; cover the remains with hot water again; let it settle and take again in the same way.

AUNT RACHEL.

News of the Week.

HOME NEWS.

MONDAY, Nov. 21, 1881.

LATEST ABOUT GUITEAU.—On Saturday as the prisoner was being conveyed from the Court House to the Jail, after the trial, a mounted horseman followed the prison van for some time and then rode up to its side and fired a pistol shot at Guiteau. The shot took effect in Guiteau's arm causing a simple flesh wound. A police officer who was in the seat with the driver of the van fired at the assailant but missed him. The clumsy van gave chase as soon as possible. The supposed assailant was finally arrested and confined in jail, but there is some doubt whether or not he is the man. The man arrested is one Jones who owns a farm near the city, but who is thought to be a "crank." Those who know him say he is half-witted rather than crazy. Guiteau wants his body-guard increased. Dr. Bliss was on the witness stand on Saturday, and a portion of the vertebræ injured by the ball was examined by the jury. Col. Rockwell and Gen. Swaim also testified. To-day Mr. Scoville will, it is reported, ask his associate Mr. Robinson to withdraw from the case, the latter having for the third time pursued a line of policy which Scoville did not approve. The Government expects to close its case to-day or to-morrow, but Mr. Scoville thinks the trial may yet be prolonged for six weeks.

Ex-Senator Roscoe Conkling has opened a law office in the Bank of Commerce building, New York—at Cedar and Nassau Streets. He, like Blaine and Grant, seems to have decided to live in New York. His law practice will no doubt be large.

Michigan University is to have a new museum which will cost $60,000.

J. A. Poorman, Paw-Paw, Mich., and two children, ate pancakes one morning, mixed with arsenic in mistake for baking powder. Mr. Poorman died and the children cannot recover.

A transfer of $45,000 of real estate in McLean County, Illinois, represents the losses of the former owner in two weeks of heavy play at poker.

A Virginia paper, to which perhaps the wish is father to the thought, says that the desirability of a reunion of Virginia and West Virginia is felt by many in both States, and it believes the question cannot long be kept out of the discussions during the political campaigns in Virginia.

A Surprising Change.

"I take no other medicine whatever, therefore must attribute my improved condition to Compound Oxygen. Four weeks ago I was weak, *unable to sit up long at a time*, with paroxysms of coughing that would make my lungs feel sore and prostrate me very much. *The change has been so surprising to me and my family.*" Treatise on "Compound Oxygen" sent free. Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia Pa. —*Adv.*

AGRICULTURAL NEWS.

MONDAY, Nov. 21, 1881.

HERE are some items of agricultural news condensed from telegrams received here between Friday noon November 18 and noon today: Portland, Me.—The advance in railroad freights tends to depress breadstuffs. Dairy products dull. Produce in good supply; market more sluggish.....Boston, Mass.—Flour dull influenced by late downward movement of wheat at the West. Demand for provisions increasiug, a good trade for the time of year. Business of the week in wool has been good—sales 2,800,000 pounds, of which 350,000 pounds have been fine Ohio and Pennsylvania fleeces at 43@45c, mostly at 44@44½c. Michigan and Wisconsin fleeces have sold at 41½@42½c for X. Unwashed wools in demand, sales of all sorts 1,000,000 pounds, including considerable coarse at 17½@20c; fine at 25@30c; and medium at 24@34c per pound. Large lots of Missouri selling at 28@30c, and good to choice Western medium at 30@31c. Combing and delaine fleeces steady, delaine 45@49c, and Missouri, Kentucky and Illinois combing at 30@32c. California wools move slowly; some 336,000 pounds having been sold at 12@14c. Prices stiff; manufacturers run pretty close, but owing to nearness of time for taking stock and settlement, much stir in business isn't expected until after the holidays.....Philadelphia, Pa.—Flour and grain rule steady and firm. Owing to small demand for foreign shipment, the supply is fully up to the demand. A fair trade in hides at steady prices; goat skins in demand at high figures as the market is short of best grades. Choice potatoes command high prices, and general produce is firm. Supplies of fruit generally inferior; apples plentiful, prices favoring buyers except for fancy lots. Cheese quiet; very little trade in provisions. Cotton market more active with a rise of 3-16@¼c. Wool market firm; but little doing..... Cleveland, Ohio.—Grain market unsteady. No. 2 Red Winter wheat $1.36. Hog market active, receipts 4,000 a day. Sales $5.05@$6.-32½ per 100 pounds. Clover seed dull and down to $4.75 for prime medium or mammoth.....Cincinnati, Ohio.—The formation of a hide and leather exchange promises good results. Grain and its products have rallied and advanced, but got a set-back on Thursday. In Spite of warm weather the provision trade has been active especially for green meats..... Indianapolis, Ind.—Weather too warm for the season and considerable rain. Country roads in bad condition, all business greatly embarrassed therefore.....Minneapolis, Minn.—During the week the ground in the Northwest has been frozen so deeply as to stop plowing, leaving 20 per cent of the wheat land in this State not plowed. Thrashing wheat is progressing but much of the grain being thrashed is injured by wet. Wheat delivered here during the week shows considerable loss of grade; market unsettled but lower. More than half the flouring capacity of this city is shut down. Flour in light stock, and held firmly. Most of the lumber mills have shut down owing to running ice; all must soon close for the season, leaving 50,000,000 feet of logs on hand and light stocks of lumber. County collections generally good.....St. Paul, Minn.—Weather bright and cold. No snow except farther West; the North Missouri is frozen solid at Bismarck and navigation is closed to the upper country. The fuel problem for interior points is exciting great interest; the railroads find trouble in meeting calls for transportation.....

Chicago, Ill.: A good speculative trade in grain, but receipts light, with prices unsettled and irregular. Hogs coming in freely; an improvement in quality over last month, though some complain that they are not as solid and are not larding as well as expected. Mess pork on hand, 76,501 barrels of new Winter-packed, and 30,532 barrels of last season. Receipts of breadstuffs for the week are: 52,600 barrels of flour; 210,618 bushels of wheat; 1,164,555 bushels of corn, and 209.272 bushels of oats. Shipments, 53,145 barrels of flour; 170,358 bushels of wheat, 1,599,564 bushels of corn and 246,986 bushels of oats. No money to go into the country for grain, but considerable for hogs. Packers are borrowing more money than at any previous date this seasou.....Peoria, Ills.: The inclement weather is very unfavorable to packers who began operations recently. The Illinois River is rising rapidly here, but thus far no damage to property has been done..... Milwaukee, Wis.: The continued stormy and wet weather renders communication with the interior difficult and the transportation of produce and merchandise impossible. All the interior mills and factories have been shut down on account of floods. Receipts of cereals and produce light. Considerable damage to stacked grain reported owing to rains. Millers here have nearly all closed, and flour is dull.....Louisville, Ky.: Leaf tobacco firmer and strong both old and new grades. Flour dull, dealers having stocked up during the excitement. Corn in fair demand; receipts moderate. Considerable rye, corn and oats will be needed in the country tributary to Louisville, which must come from the West. Provisions are low. Only 4,000 hogs have been killed to date [Friday evening], the weather having been unfavorable. St. Louis, Mo.: All grains are declining. Packing hogs in demand and scarce on account of cold facilitating packing. Export steers scarce. Missouri plug tobacco abundant; Virginia leaf scarce.....Kansas City, Mo.: Grain market weak; prices lower. Cattle receipts small, cattle market quiet with downward tendency in sympathy with declining markets East. Hog receipts heavy; prices have declined 10c.....San Francisco, Cal.: Wheat market easier, several speculative holders having sold out. Farming work greatly helped by late rains. No compromise is probable on the "slickens" question pending the trial of a test case at Sacramento to force miners to stop deluging the lowlands with *debris*.....Baltimore, Md.: Flour now in good demand and prices firm. Western wheat active and fluctuating; Southern quiet. Corn market dull; good supply of new Southern. In stock: Wheat, 2,129,277 bushels; corn, 789,401 bushels. Cotton receipts large; market steady; sales limited owing to firmness of sellers. An active demand for prime steers' hides; Southern lights lower. Maryland tobacco is held firm. Provision jobbing trade active; prices firmer. Choice lots of butter in demand and scarce. .....Wilmington, N. C.: Weather pleasant. Cotton active at full prices. Provisions in good demand. Peanuts have a fair inquiry. Grain dull. Rice steady.....Savannah, Ga.: Cotton market very strong; one bale sold to-day (Friday) at 12c. per pound. Receipts, 5,278 bales; sales, 4,156 bales; stock on hand, 89,478 bales.....Augusta, Ga.: Cotton coming in rapidly; sales large at very satisfactory prices.....Atlanta, Ga.: Weather favorable for gathering cotton; picking season about over, though much of the crop is still in the hands of raisers who are holding out for better prices. Crowds daily attend the Exposition, which promises to be a success in all respects.....New Orleans, La.: Hay weak at $24 per ton for prime; choice, $26. Cotton steady: middling, 11½c.; low middling, 11⅛c.; good ordinary, 10⅝c.....Memphis, Tenn.: Provision and produce markets well supplied; a fair demand but prices weaker.....Nashville, Tenn.: Produce higher, except eggs, which bring 20@21c. from the wagon: a general egg scarcity in nearly all the country markets. Feathers have declined from 48c. to 46c. and have a downward tendency. Country collections, as a rule, are fair.....

From the Atlanta (Ga.) Sunday Phonograph: The editor for the Pikes county News has been cured of rheumatism by St. Jacobs Oil.

The New Carpets.

Messrs. J. & J. Dobson have in the course of the past year been adding new looms to their factories on the Schuylkill and have been otherwise enlarging their facilities for the manufacture of carpets, the evidences of which are shown in the great variety of rich fabrics exhibited in their vast salesrooms at Nos. 40 and 42 West Fourteeeth Street, New York. Though carpets of all grades are here shown, yet the stock is specially replete with the finer varieties, the Wiltons, the Moquettes, the Axminsters, etc., the Messrs. Dobson having of recent years carried the manufacture of these more costly fabrics to a degree of perfection rivaling the best European workmanship. They have introduced this Autumn many new designs conceived in accordance with the latest canons of decorative art. These designs consist for the most part of a combination of geometrical figures and flowers—the latter, however, not futile attempts at the reproduction of nature, but generalizations of natural forms. The firm is one of the most reliable in its branch of business, and out of-town people would do well, no doubt, to make an investigation of its goods, before purchasing elsewhere.

"The Doctor told Me

to take a blue pill, but I didn't, for I had already been poisoned twice by mercury. The druggist told me to try Kidney-Wort, and I did. It was just the thing for my biliousness and constipation, and now I am as well as ever." Sold both dry and liquid.—Detroit Free Press.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipatiou, biliousness, etc. One-half to one lozenge is enough. Price 25 and 60 cents per box.

BURNETT'S COCOAINE

Has Received Universal Endorsement.

No other preparation possesses such remarkable properties for embellishing and strengthening the hair and rendering it dark and glossy. It cures baldness and eradicates dandruff.

BURNETT'S FLAVORING EXTRACTS are the best.

The Markets.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Nov. 19, 1881.

BEANS AND PEAS.—Marrow beans are rather firmer with a fair export call; mediums dull and weak. German stock is quoted very close to State and buyers prefer the latter. Fancy beans quiet; green peas not moving; quoted $1.40@1.70 poor to best Wis; Southern B, E. peas in fair demand at $3.35@3.40, which is higher.

Marrow beans, prime, $3.45@3.50; fair to good, $3.25@3.35; medium, prime, $3@3.10. fair to good, $2.75@2.90; pea, choice, $3.25@3.30; white kidney, $3.40@3.45; red kidney, prime, $2.90; fair to good $2.60@2.75; turtle soup, $1.80@1.90.

Receipts of beans for the week, 8,980 bush.
Exports do. 385 bbls.

BUTTER.—Confidence in fine butter still exists but low grades divide the business with oleo. Sellers are handling a good deal of high bought stock and a break in rates upper grades of stock would be severe upon such owners. Possible light supplies from the west this coming season helps to strengthen rates but there is a large quantity of medium class goods that must be unloaded before the market will ride free. Creamery is scarce and fine half tubs are quoted quite crisply. Entire dairies will make 30c. when every way right; an extra Delaware sold during the week at 32c. The bulk of State full dairies range at 26@29c, and 28c. is the top for firkin dairies. Stock is widely scattered this season.

Creamery, State and Elgin, choice, 37@38c.; good to prime, 32@35c.; sweet cream, fresh, 33@34c.; fair to good, 28@29c.; State, June, good to prime, 22@28c.; State firkins, dairies, choice, 28c.; good to prime, 26@27c; fair, 22@24c.; poor, 18@20c.; dairies, half tubs, choice, 33@35c.; good to prime, 30@32c.; fair to good, 27@30c.; Welsh tubs, choice, fresh, 32@33c.; good to prime, 28@30c.; fair to good, 25@28c.; poor to fair, 18@25c.; Western imitation creamery, 25@26c.; Western dairy, fresh, choice, 28@30c.; good to prime, 23@26c.; fair to good, 18@22c.; poor to fair, 17@20c; factory and ladle-packed, Iowa, fine June, 16½@17c.; Ohio and Ind. June, good, 15½@16½c.; late made, 18@20c.; fair, 10@16½c.; poor, 13½@12c.

Receipts for the week, 24,086 pkgs.
Exports do. 825 do.

CHEESE.—Exporters still operate only to a moderate extent. The home trade and coastwise wants are enlarging, but the general market is in poor form. Country prices weak.

State fact'y, fine, Sept. 12½@12¾c.; good to prime, 11@12c.; fair to good, 10@11c.; poor to fair, 9@10c.; Ohio factory, flat, fine mild, 12@——c.; good to prime, 10@11c.; fair to good, 9@10c.; creamery, partly skimmed, choice, 9@9½c.; poor to good, 4@7c.; fully skimmed, 2½@3c.; full skimmed factory, 2½@3c.

Receipts for the week, 45,437 bxs.
Exports do. 13,613 do.
Liverpool cable, 55@63s. the lower for Summer.
Steam to Liverpool, 12s. 6d.@17s.

COTTON.—With nearer complete agricultural reports for October it is shown that good weather for that month offsets in a great degree the damage noted in some former reports, and a really good top crop is now expected. There is consequently less hardiness to prices, but there is no real fall back in the main as a good speculative trade has been revived at the close.

CURRENT PRICES FOR SPOT COTTON.

Quotations based on American standard of classification and on cotton in store, running in quality not more than half a grade above or below the grade quoted.

	Uplands.	N. Orleans and Gulf.	Texas.

Strict good ordinary	9 13-16	Middling	11½

Average of futures:—
November, 11.85c.; December, 11.94c.; January, 12.16c.; February, 12.36c.; March, 12.55c.; April, 12.62c.; May, 12.79c.; June, 12.91c.; July, 12.99c.; August, 13.05c.
Receipts for the week, 44,264 bales.
Exports do. 4,956 do.

EGGS.—Receipts for the week, 10,500 bbls.; do. last week, 8,576 do. The supply of fresh is light for the increased wants of the coming festival, and prices are restrictively high. A good many held eggs are offering, but many prefer trustworthy parcels of fined at the relative prices.

New Jersey, Long Island and other near points, ₱ doz. 34@35c.; Pa. and State fresh, 27@30c.; Canadian, 26@27c.; Western, 27½@28c.; Western and Canadian, fair to good 26@27c.; fined State, 23@23½c.; Canadian and Western 21@21½c.

FLOUR.—A good local demand has prevailed for the high grades, including Minn. extras and patents, at full prices. Medium and lower sorts are in large supply and rule easy under a light exportation. There is no radical decline for the week, as a falling off in receipts is expected. It is alleged that many Western mills will shut down owing to the difficulty of obtaining suitable grades of wheat at safe figures.

No. 2, $3.50@4.50; State and Western, superfine, $4.50@5.25; city mills, XX, $5.90@7.35; Spring wheat, extra, $5.35@5.65; Spring XX and XXX, $5.85@6.75; patents, $6.50@8.70; Ohio round hoop shipping, $5.60@6.00; trade brands, $6.25@6.65; St. Louis extra, $5.75@6.25; do. double extra, $6.10@6.65; do. family, $6.75@7.00; Southern extra shipping, $6.00@6.10; do. XX and family, $6.50@7.25. Rye flour, superfine, $5.00@5.35; buckwheat flour ₱ 100 lbs. $3.80@4.00. Corn-meal, Brandywine, ₱ bbl. $3.80@3.85; do. Western, $3.25@3.80.

Receipts of flour for the week, 137,044 bbls.; corn-meal 5,050 do.
Exports of flour for the week, 70,650 bbls.; corn-meal 5,675 do.

FRESH FRUITS.—Apples are going abroad freely. New York 10,000 bbls., 6,100 went from Boston and 9,000 from Montreal. The offering is large and mainly of common mixed stock. Fine straight lines are being stored. Cranberries continue firm with more local call. Quinces slow; pears are weak and irregular; quality is not uniformly good as December comes nearer. Choice Catawba grapes are in good demand. The attempt to ice-house Concords and Isabella proved a failure. Florida oranges are not of commercial excellence.

Apples, Baldwin and Greening, fancy, ₱ bbl. $3.37; N. Spy, State, $2.50@3; straight lots seconds, $1.75@2; mixed lots, State, prime, $2.75@3; do. seconds, $1.75; Phœnix, Jersey, ₱ round hoop bbl. $2@2.50. Pears, Boston, bush. boxes, fancy $4.00@5.00; Lawrence, State $2.50@4.50; Vicar of Wakefield, $2@3.50; cooking, $2@3. Grapes, Catawba State, case of 18 3-lb. bxs, $1@1.50; bskts, ₱ lb. 7½@8½c.; Concord, bskts, 2@4c.; Isabella, State bskts, 8@10c. Florida oranges, half-bbl. bxs, choice, $1; good to prime, $3@3.50; inferior, $2.25@2.50; thirds, fair to prime, $2.25@2.50; inferior, $1.50@1.75. Cranberries, Cape Cod, fancy, large, ₱ bbl. $9.50@10; good to choice, $7.50@9; poor to fair $5@7.50; frosted $3@3.50; ₱ crate, $2.50@3.25; New Jersey fancy, $2.75@2.87; fair to prime, $2.12@2.62; poor to fair, $1.75@2.12; frosted, 50c.@$1.

Peanuts, Va., hand-picked, ₱ lb, 7@7½c.; fancy, 6¾c.; extra prime, 6¼c.; good to prime, 5¾@6c. shelled, 5@5c.; pecan nuts, 9@11c.; hickory, shell-bark, Northern, ₱ bu. $1.00@1.12; Western, $1.00; bull, 40@50c.; black walnuts, 40@50c.; chestnuts, Southern, $4@6; Northern, $6@7.

GRAIN.—The wheat market exhibits more tone under a freer export movement, while the visible supply at the points of collection is somewhat diminished. Corn is also doing better, shippers taking better grades than usual. Oats hold up well both cash and speculative interests receiving liberal attention.

Wheat, Spring, $1.27@1.31; Spring No. 2, $1.37@1.39; red Winter No. 2, $1.43@1.44; red Winter, $1.32@1.45; white Western and State, $1.33@1.45. Rye, 98c.@1.03; Oats, white No. 1, 53c.; No. 2, 51½c.; No. 3, 49@49½c.; mixed, No. 1, 48c.; No. 2, 47½@47¾c.; No. 3, 45@47c; Corn, Western mixed, 67@69c.; No. 2, 68@68½c.; yellow, 68@72c.; white, 70@73c. Barley, Canada No. 1, $1.14@1.16; do. bright, $1.17@1.18; State 4-rowed, $1.02½@1.05; 2 rowed 88@90. Buckwheat, 90c.

Receipts for the week, wheat, 934,700 bush.; corn, 1,495,900 do.; oats, 172,300 do.; rye, 85,588 do.; malt, 52,500 do.; barley, 233,851 do.
Exports for the week, wheat, 769,702 bush.; corn, 683,975 do.; oats, 1,992 do.

HAY AND STRAW.—Exports for week 1,050 bales. There is a good demand for hay and fine quality is quoted as before. Receipts abundant but not pressing the market; straw steady.

Prime Timothy hay, ₱ 100 lbs., $1.05@1.10; medium Timothy, 85c.@$1; shipping grades, 65@70c.; clover mixed, 70@85c.; clover, 60@65c.; Straw, long rye, 75@80c.; short rye, 55@60c. oat and wheat straw, 40@50c.

HOPS.—Beyond a fair brewers' demand the market is quiet. Prices are above exporters' views. Sellers, however, do not feel inclined to make much concession as the European markets are quoted strong and high prices are ruling in the interior.

Crop of 1881, choice, 28@29c.; good to prime, 25@27c.; fair to good 22@25c.; eastern, 18@27c.; 1880, good to prime, 18@22c.; poor to fair, 10@15c.; 1879 fair to prime, 8@15c.

Receipts for the week, 2,770 bales,
Exports for the week, 100 do.

MILK.—The demand is good, but prices have shown a wide range, at one time down to $2.25 ₱ can of 40 qts, and then up to $3.75 do. The average for commission cans made $3.07.

POULTRY AND GAME.—For dressed poultry the weather is not favorable. Dealers all hope for cool weather for Thanksgiving stock; when the weather is soft losses are frequent and a poor Thanksgiving trade has always spoiled the market for a long time. Prices easy.

Turkeys, Phila. prime, 14@15c.; Jy 13@14c; State and W'n pr. 12@12½c.; f'r to good, 10@11c. Chickens, Phila. prime, 14@16c.; Bucks Co. do. 14@15c.; Jersey, do. 13@14c.; State and Western, do. 11½@12c. Fowls, Phila. prime, 13@16c.; Bucks Co. 12½@13½c.; Jersey, do. 12@13c.; State and Western, do. 11½@12c.; fair to good, 9@11c.; inferior, 8@10c. Ducks, Phila. prime, ₱ lb, 15@16c.; Jersey and Bucks Co. 14@15c.; State and Western, 13@14c; fair to good, 10@12c. Geese, Phila, dry-picked, prime, 13@14c.; Jersey and Bucks Co. 12@13c.; State and Western, 10@11c.; fair to good, 9@10c. Squabs, white, ₱ doz. $2.75@3; dark, $1.75@2.

For what steady trade there will be for several weeks, cooped stock might be kept at home. Market very low and easily overstocked.

Chickens, Jersey, State and Penn. 10c.; Western and Southern, 8@9c. Fowls, Jersey, State & Penn. 10c.; Western and Southern, 8@9c. Roosters, old, 5c. Turkeys, Jersey and Penn. 10@11c.; Western, 8@10c. Ducks, Jersey, extra large, ₱ pair, $1@1.25; Jersey, New York and Penn. 60@75c.; Western and Southern, 45@50c. Geese, Jersey, $1.50@2; N. Y. and Penn.

FREE TO JANUARY 1ST.

The Fair Number of the **Rural New-Yorker** *(44 pages), which contains a full description of our* **Free Seed Distribution for 1882,** *also an account of the* **$2.000 worth of Presents** *offered to those subscribers who produce the best yields, and our Premium Lists for all who interest themselves in securing subscribers for the Rural New-Yorker, will be sent free to all applicants. Our new Posters are also ready and will be sent free to all. Our friends and agents are reminded that the present is, on many accounts, a more favorable season for securing subscriptions, or the promise of them, than later, when competition is keener.*

The Rural New-Yorker is for the North, South, East and West.

It knows no sectional prejudices. Everybody who is interested in a garden, vineyard, orchard or farm; in new plants, in farm or garden implements; everybody who is interested in Horticulture, and seeking through such means to increase the happiness of life and home, should subscribe. The Rural New-Yorker is the earnest friend of all who love nature and her works.

The first journal to have established an Experimental Farm conducted in the interests of its readers.

The Rural New-Yorker is acknowledged, by those who should know, to have worked a new era in rural journalism. Five Hundred Illustrations from nature annually; the best writers; the best draughtsmen. Ask those who know.

Horses, Cattle, Sheep, Swine, Poultry,

Milk, Butter, Cheese, Diseases of Animals, Bees, Injurious Insects, Grain, Grass, Small Fruits, all Ornamental and Useful Trees and Shrubs are among the prominent subjects treated in its columns.

No matter where you live, you cannot afford to be without the Rural New-Yorker. It is the progressive, aggressive, alert, original, conscientious rural journal of the age. Thousands of testimonials to this effect. Our **Everywhere Reports** are invaluable to the Farmer and Horticulturist. They have proven of great value to them in determining the best time to **Buy** or **Sell**. Our market reports are corrected by a special reporter up to the time of going to press. Our agricultural and general news embraces everything of interest to intelligent readers. Correspondents everywhere. Thirty-second year of its age: Fifth year under its present management. Try it—*Try it*—TRY IT—for one year. It will cost you but $2.00. It may save you hundreds. Try it as a measure of Economy.

The objects of the Experiment Farm of the Rural New-Yorker are to test all kinds of new seeds and to present the results to our readers; to produce new varieties of grain by cross-breeding; to test new farm implements and methods of culture, with a view to producing the greatest yields at the smallest cost; to disseminate seeds of varieties which, from our own tests, have proven of unusual worth among our readers, without cost to them, and thus advance the agricultural interests of the whole country.

The Rural New-Yorker has no personal interests to subserve. It has neither seeds nor plants nor books nor anything whatever to sell. It is conducted purely in the interests of Agriculture and Horticulture and Stock-Keeping. Its tests of plants, seeds, manures, implements, are made regardless of individual interests or those of advertising patrons. It holds the interests of LAND CULTURE as above all others, and its aim is to benefit all who occupy themselves in the culture of land and its attendant industries, either for pleasure, profit or support.

The Rural New-Yorker earnestly labors to instruct the stockman and breeder; to introduce new fruits of improved quality; to make known the beneficent influences of the garden and of trees and shrubs about the home; to increase the comforts, refinement, health, and the general welfare of all who own and cultivate land. It tests all new vegetables, and makes known their value. It tells how to raise them in the greatest perfection. Shrubs and trees, flowers, plants of every description, the methods of cultivation to suit the varied and ever-changing conditions which arise, constitute prominent departments.

The insect enemies which infest our field crops, our fruit trees and small fruits as well as vegetables and flowers, and which seem to be rapidly increasing, are subjects of our most careful consideration, and entomology in general is treated in our columns by the ablest specialists in the country.

The Progress and Development of American Horticulture and Agriculture

are always our earnest endeavor. Such efforts as these have brought the Rural New-Yorker to the position it now occupies. The Price of the **Rural New-Yorker is reduced to $2.00 a Year,** payable *invariably in advance.* We have now no club or second price. It is alike to all. ☞ Send for the Fair Number which explains all.

Address RURAL NEW-YORKER, 34 Park Row, New York.

$1.25@1.62; Western mixed, $1@1.39. Pigeons, 20@25c. Game is in good demand and quality favors sales, though prices are higher.

Canvasback ducks, Havre de Grace, $2.75; Norfolk, $2, Western, $2@2.50; redhead Havre de Grace, 90c.@$1; Norfolk, 25@75c; Western, 75c.; mallards, 50@75c.; teal, 50@60c; common, 30@35c, all per pair

Quail, choice, ₹ doz. $1.50@3; inferior, $1.75@2; grouse, choice, ₹ pair $1.12@1.25; soft, 75@75c.; partridge, State and Western, $1.25@1.35; Eastern & Minn, 75@8 c.; soft, 50@70c.; woodcock, choice, 65@75c.; inferior, 50@60c.; rabbits, 35@40c.; venison, Minn. short saddles, ₹ lb. 15@17c.; Western, 13@15c.; whole deer, 9@11c.

PROVISIONS.—Hog products have taken a favorable turn for the seller; prices are higher and the market is active. The French Government has removed restrictions upon American provisions and the fact has revived action among continental shippers. The new phase of firmer rates have a very wholesome tone when the heavy deliveries of hogs at the West is considered. For several days the Western centers have reported arrivals of 100,000 head. Beef steady for the contracts that are to be filled.

Pork, prime mess, ₹ bbl. $15.50@18; extra prime, ₹ bbl. $16@16.25; Western mess new, $17.50@18.00. Lard, steam Western, ₹ 100 lbs., $11.50; prime city, $11.30 Hams, smoked city, ₹ lb. 12½@13c.; pickled Western and city, 10½@10¾c.; Shoulders, smoked city, 8¼@8½c; pickled, 7¼@7½c. Rib bellies, pickled, 9@9¼c. Bacon, long clear Western, 9½c. Beef, Western mess, ₹ bbl. $12; packet, $14; India mess, ₹ tcs. $23@25. Beef hams, ₹ bbl., $19.50@20.50.

Receipts for the week—Beef, bbls. and tcs. 2,818; pork, bbls 4,000 cut-meats, pkgs 31,450; lard, do. 12,400.

Exports for the week—Beef, bbls. and tcs. 2,514; pork bbls. 3 750; cut-meats, lbs. 4,466,020; lard do. 3,878,879.

RICE.—The movement is steady and fair and prices unchanged. We quote:—

Carolina and Louisiana, common to fair, 5¼@6¼c.; good to prime, 6¾@7¼c.; choice, 7¾c.

SALT.—The various brands are quoted as follows:

Ashton's at $2.50; Higgin's at $2.50; Phœnix superfine sifted dairy at $2.50; Holmes's extra sifted at $2 50 per sack and 85c per quarter sack; Deakin's at $1 40@1 50; Washington's at $1 40; Marshall's at $1 40; Virden's at $1 40.

SUGAR.—Refined shows slight change in prices, favoring buyers, with trade slack.

Cut loaf, 10¾@10¾c.; crushed, 10¾@10¾c.; powdered, 10c.; granulated, 9 11-16@9¾c.; mould A, 9¾c; confectioners' A, 9 7-16@9½c.; standard A, 9¼@9⅜c.; off A, 8¾@9¼c.; white extra C, 8⅜@8⅝c.; yellow extra C, 7⅞@8¼c; C, 7¼@7⅝c.; yellows, 6⅞@7⅛c.

TOBACCO.—The features of last week are the only prominent ones. Most fine grades of leaf are still above the views of manufacturers,

VEGETABLES.—Exports of potatoes for week 5,208 bbls. With lighter receipts of potatoes the market is steadier. Very choice marks are going in store for Winter use; sweet potatoes have advanced.

Potatoes—Early Rose, Eastern, ₹ d.-h. bbl., $2.50@3; State, $2.50@2.75; bulk, ₹ bbl. $2.37@2.62; Prolific, Eastern, d.-h. $2.50@2.62; Snowflake, State, $2.50@2.75, bulk, ₹ bbl. @ 2.62; Burbank, d.-h. $2.50@2.75; bulk, ₹ bbl. $2 37@2.62 Peerless, $2.25@2.37; Mercer Eastern, ₹ d.-h. bbl. $2.25; sweet potatoes, Va. yellow, ₹ bbl. $3 75@4.00; Del. River, $1@4 25, Jersey, $3.50@4.75

Onions, white bulk, ₹ bbl. $3.00@4; yellow, $2.25; red, east, $2.12@2.25; red, Chester, $2@2 12; squash, Marrow, ₹ bbl., $2.25@2.50, Hubbard, $2.75@3.75; cabbage, ₹ 10 $8@14; beets, L. I. ₹ bbl. $2.25@2.50 carrots, $1.25; turnips, Russia, L. I. $1 75@2, cauliflower, fancy, $5@7 average quality, $1.75@2.50; inferior, 50c@$1; celery, ₹ doz., $1.50@2.25.

WOOL.—Prices hold steadily, and though at the moment business is not large, holders express a determination and an ability to carry the unsold surplus.

LIVE STOCK MARKETS.

NEW YORK, Saturday, Nov. 19, 1881.

BEEVES.—Receipts for the week, 13,848 head; do. last week, 15,021 do. With a dull, heavy dressed beef market, warm and muggy weather and a liberal supply of cattle trade was uncommonly slow and a large amount of stock will be carried over. Texans, Cherokees and Coloradoes sold at 8@8¾c. to dress 55 lbs.; poor to choice natives from 8c. to dress 55lb, up to 12c. to dress 57 lb.

VEAL CALVES.—Supplies run light and prices rule firm. Hog dressed have a steadier sale.

Hog-dressed country, choice, 13½@14c; fair to good, 12@13c; grass, 5@6c; fed 6@7c; live calves, N. J. prime to choice, 9½@10c.; do. State, 9c@9½c. fair to good, 8½@9c., poor to fair, 6@8½c.; Mount Hollys, 7@10c.; fed calves 4@4¾c; grass 3@3¾c.

SHEEP AND LAMBS.—Receipts for the week, 37,786 head; do. last week, 27,448 do. Market quiet and a little lower. Sales of sheep were mainly at 3¾@5¼c. for poor to good; with 5½c. for a load of Ohio wethers for export; also a carload of very choice do. home use at 6c. Lambs brough from 5½@6¼c; only a very choice lot would reach 6¾c.

MILCH COWS. For common cows the market is weak and easy. "Springers" are quoted at $30@35 ₹ head Common to choice range $40@75.

SWINE.—Receipts for the week, 38,710 head; do. last week, 28,713 do. Market easier, after good prices during the week. Live quoted $6.25@6.50 ₹ 100 lbs.; rarely above $6.37.

New Jersey dressed, light, 8¼@9¼c.; other weights, 7¾@8¼c.; city dressed, 7¾@8¼c. Pork tenderloins, 12@12½c.

For the Young.

CHILDHOOD.

THRICE blest oasis in life's desert, where
Oftimes amid our journeys we turn
With empty, longing hearts, and eyes that burn,
With feverish light, as we in fancy hear
The gurgle of its streams, and bathe therein
Our aching limbs and cool our heated brain.
Repose amid its grateful shades again,
Far from the busy world, its strife and din;
Hark! hark! that sound, that dear familiar bell—
Charmed by the sacred sweetness of its chime,
We listen now, as in the olden time,
As with the olden joys our pulses swell.
When lo! the mirage lifts itself in air,
And leaves us standing in the noonday glare.

MATTIE N. BROWN.

UNCLE SAM'S TIME-PIECE.

Perhaps some of the young readers of the RURAL have wondered how all the time-pieces in the country are, or may be, regulated to keep uniform time. At Washington, D. C., in the great Naval Observatory, stands Uncle Sam's big clock. It resembles somewhat those old-fashioned clocks that stood many years ago in our grandmother's kitchen, about which my young readers have doubtless read. But it has a more solid foundation than any time-piece of the early days; it is "founded on a rock," that is, it is fastened to a pier which rests upon a solid rock foundation. The fierce winds may blow never so hard, the rain-storms may beat never so strongly upon it, the great clock is unaffected thereby. It ticks, ticks, ticks, day in and day out, and how much do you suppose it varies in 24 hours? About 48 100 of a second! Wonder if any of our farmer boys have watches that vary as little as that!

Every day, at three minutes before 12, the regulator, as the clock is sometimes termed, is connected with the telegraph wires, and for these three minutes the track must be kept clear, and all messages, however important, must wait. Now then, in every village and city, indeed wherever there is a telegraph instrument in connection, the instrument records each tick of the clock, which occurs once per second, and just at 12 o'clock two ticks are made, and in an instant the "correct time" may be known throughout the country. Every noon people may be seen in the vicinity of the RURAL office holding their watches in hand and looking steadily at a great black ball suspended above the dome of the telegraph building. When the clock at Washington marks the hour of 12 this ball falls to the dome, and then the people can ascertain whether they have "ball time" or not.

It is probably not necessary for me to tell the boys and girls of the RURAL family that only those places situated on the same meridian with Washington have exactly the same time, and to get the *same* time in places in longitude east or west of Washington, the number of minutes it takes Old Sol (for after all he is the great time-piece) to pass these degrees must be added to, or subtracted from, 12. Remembering that he travels one degree, or about 69 miles, every four minutes, the exact time may be easily computed for any place.

UNCLE MARK.

AGRICULTURE.

AGRICULTURAL ARTS are amazingly ancient. Adam, Abel and Abraham all admired and adored agriculture. Alas! Adam ate an acrid apple, and all are accordingly accursed. Agriculture and associate allies, as arboriculture and apiculture, attract and astonish amateurs. Anger and anguish are alike arrested and assuaged at arable arts. American agricultural associations are annually advancing apace; and are assiduously active and assuredly assisting authoritative analyses. Acids and alkalies are already annexing arid areas, and apples, apricots, asparagus and artichokes appear as abundantly as acorns. Ardor and assiduity accomplish anything. Above all, arrant adulterations are awfully annoying, and abominable artificial articles are alarming all, and are alienating acceptable alliances. Adieu. TOM.

Hudson, N. Y.

NOTES.

ONE of the cousins tells how to prepare Autumn leaves for the Winter. Place them on a clean cloth, sprinkle powdered resin on them and press them out with a hot flat-iron which may be cleaned again with salt. She sews the leaves to paste-board cut in form of crosses, anchors, etc.

Keep the subject for the next Discussion in mind, and send in your comments soon. Let everyone tell what they know about keeping flowers in Winter.

Will Mable Walling, Carrie Heeny and Jenny Haresnape send their addresses. Always be particular about giving address in full.

A cousin wishes to know how to make rustic hanging baskets, vases, brackets, etc. Who will inform her?

"The Horticultural club is beginning to look like a club now, sure enough. The Discussions are splendid." So two Virginia girls write.

THE YOUNG QUERIST.

E. W. B., Factory Point, Vt., asks where books on sketching may be obtained.

ANS.—Write to Harper Bros., New York.

Jenny H., no address, asks why her double camellias do not seed like the single ones.

ANS.—Double flowers arise from the merging of stamens and pistils (the seed producers) into petals; hence when this merging is complete and fully double flowers are formed the organs which produce seed are simply leaves and can no longer perform their true function.

H. & C. J., Cohocton, N. Y., wish to know, 1, what ails their Hibiscus Syriacus plants; they cannot succeed in raising them, either out-of-doors or in the house; 2, where can cuttings of the Crab Cactus be obtained.

ANS.—1. The Hibiscus Syriacus is hardy with you, and should survive the Winter. Without particulars we can give you no more definite reply. 2. Cuttings of the Crab Cactus may be obtained of almost any florist.

M. S. W., Alden, N. Y., asks, 1, how long does it take seedling chestnut and black walnut trees to bear fruit after the seed is planted; 2, is there any possibility of a young horticulturist raising seedling gladioli.

ANS.—1. About ten years. 2. Certainly there is. The seeds are really little bulblets. If planted like other seeds flower bulbs may be produced in three years.

New Members of the Club for Week Ending Nov. 19.

LETTERS FROM THE COUSINS.

An Experiment with an Acorn.

DEAR UNCLE MARK:—If you will let me I would like to tell the cousins how they can have a tree in the house this Winter. Select a large, well-grown acorn, and by the aid of a stout needle run a strong thread through it in such a manner that the acorn shall hang with the pointed end downwards. Now put the acorn in a clear glass bottle. Place the two ends of the threads over the opposite sides of the neck and secure them by tying them around the neck and fix the turns by tying the ends together. Now pour in a little water until it just reaches the point of the acorn. Then cut a small piece of card with vandyked edges, which can be turned down so as to form a loose cover. Keep the bottle in a warm sitting-room, and after a few days the acorn will open at the point and a white radicle or root will grow downwards into the water. This root will go on elongating for weeks, coiling round and round the inner side of the glass until a foot or more is packed away in the little bottle, and small rootlets grow forth profusely. At last the upper coverings of the acorn will split and the plumule, in the form of a little green stem, forces its way out, bearing delicate green leaves. These will grow with vigor, borne on a straight stem; the card covering will then have to be perforated to allow the little timber-tree to grow out. If at the end of the second Winter you plant it, it may flourish for a thousand years, perhaps. The seeds of other timber-trees may be used in similar manner, with such arrangements as are required by their size and form.

Your niece, CARRIE SPOONER.

Pottsboro, Texas.

DEAR UNCLE MARK:—We have taken your paper for a great many years, and like it very much. I would like to join the Club. We have quite a variety of flowers, viz: geraniums, dahlias, coleus, dusty millers, verbenas, and two orange trees. My dear sister Susie, who was an interested member of the Club departed this life on the 30th of July, in the 15th year of her age. We live on a farm about half a mile east of Williamsville. I am twelve years old, and, expect to attend school the coming term. This is my first letter to the RURAL.

Yours truly, SARAH E. SHISLER.

Williamsville, N. Y.

News of the Week.

HOME NEWS.

MONDAY, Nov. 21, 1881.

THE TRIAL OF GUITEAU.—The late President's assassin was brought to the bar of justice on the 14th inst. The counsel for the prosecution are District Attorney Corkhill Judge Porter, of New York, and Mr. Davidge, of Washington, and those for the defense are Mr. Robinson, of Washington, and Mr. Scoville, of Chicago. Guiteau's brother and sister were present when the trial began. The room was crowded with spectators. Owing to a misunderstanding about Robinson's employing additional counsel without Scoville's knowledge, Scoville objected to a continuance of the case. The result was that Robinson, Scoville and Guiteau were all trying to address the judge at once, the latter demanding that Robinson get out of the case. Five jurors were then selected and the prisoner was remanded to his cell. On Wednesday the remaining seven jurors were selected, one of whom is a colored man, and the case was duly opened on the 17th inst. by District Attorney Corkhill for the prosecution. He addressed the jury in a dignified manner, hastily running over the story of the assassination. Mr. Blaine, Secretary of State, was the first witness called. He was examined by the District Attorney and cross-examined by Lawyer Scoville for the defense. Camcho, Venezuelan Minister, was also called to the stand.

The Mormon tabernacle at Salt Lake city, which has been 28 years in process of construction and is not yet completed, has granite walls nine feet four inches thick, is 250 feet in diameter and seats 12,000 persons. It is a very perfect whispering gallery and the dropping of a pin or the rustle of a dress can be heard from one side to the other.

The New Lincoln National Bank of this city, has been inaugurated, to begin business January 1st. Thomas L. James, the present Postmaster-General, has been elected president by the stockholders.

Steinway Hall was thronged on the evening of the 16th by an audience of leading citizens of New York, the occasion being the concert by Adelina Patti and company in aid of the Michigan sufferers. The mayor presided. All the artists were accorded a kindly reception, and Patti was greeted with a storm of applause. The concert was a success, artistically and financially, and netted a good sum for the sufferers.

At a meeting of business men of Oshkosh and Fond du Lac, Wis., on the 16th, a memorial to the Secretary of War was drawn up setting forth the damage done to the cities of Fond du Lac and Oshkosh and the country round, and asking immediate relief by the removal of part of the Government dam at Menasha and Appleton. A committee was appointed to proceed immediately to Washington, consisting of Senators Sawyer and A. M. Paine, of Oshkosh, and A. K. Hamilton, of Fond du Lac. The damage already done by inundation is estimated at $600,000. The prospect is that the water will freeze before it lowers unless the Government interferes.

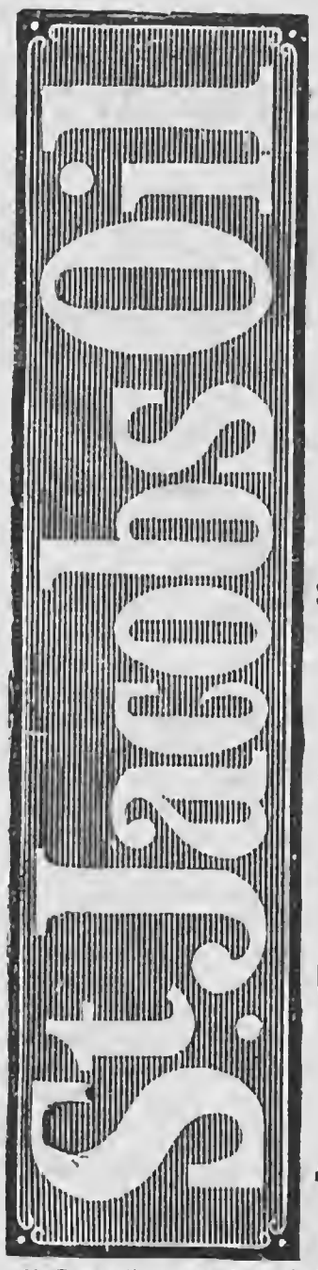
Secretary Kirkwood, in his annual report, recently submitted to the President, urges that the Indian schools be maintained and extended, and asserts that when the Indian has learned to speak and write our language, to earn his living by his own labor and to obey the law and aid in making and administering it, the Indian problem will be solved. He recommends that Congress be asked to create a commission of three or four eminent citizens to visit, during the next year, the reservation west of the Mississippi River, for the purpose of recommending to Congress, if they deem it wise to do so, the concentration of the Indians on four or five large reservations; or, if this is not deemed wise, then to recommend the concentration of existing small agencies where it can be done, and the reduction of the area of others.

One of the latest horrors related of the graveyard insurance business in Pennsylvania is to the effect that a poor, half-demented old man, upon whom a heavy policy had been taken out, was enticed to a hay loft, made drunk, and then by some ingeniously constructed trap precipitated to the stable floor below, where he speedily gave up the ghost as if by accident. We were at first inclined to doubt the credibility of this story, but since the disclosure of a still more startling and abhorrent performance at Scranton, Pa., which facts are not at all in dispute, the public can believe almost anything that is told of this abominable insurance traffic. In this case a son is under arrest for forging an application for insurance on his dying mother, 75 years old, and conspiring to take her life. It is one of the most heartless crimes of which we have ever heard.

Continued on page 804.

Miscellaneous.

The New York Clipper lately cited the case of Captain Jacob Schmidt, of Tompkinsville, Staten Island, N. Y., who had been a great sufferer with rheumatism for many years. He used St. Jacobs Oil with splendid success.



THE GREAT GERMAN REMEDY FOR RHEUMATISM, NEURALGIA, SCIATICA, LUMBAGO, BACKACHE, GOUT, SORENESS OF THE CHEST, SORE THROAT, QUINSY, SWELLINGS AND SPRAINS, FROSTED FEET AND EARS, BURNS AND SCALDS, General Bodily Pains, TOOTH, EAR AND HEADACHE, AND ALL OTHER PAINS AND ACHES.

No Preparation on earth equals ST. JACOBS OIL as a SAFE, SURE, SIMPLE and CHEAP External Remedy. A trial entails but the comparatively trifling outlay of 50 CENTS, and every one suffering with pain can have cheap and positive proof of its claims. DIRECTIONS IN ELEVEN LANGUAGES.

PERSONALS.

Bismarck is in a state of irritability. He is suffering from neuralgia.

The estate of the late General A. E. Burnside is hardly sufficient to pay his debts.

Senator Anthony has served longer continuously in Congress than any other member of either house. He has been in the Senate for twenty-two years.

The Prince of Wales' two sons have arrived in Japan from Australia and are to be the guests of the government during seven days' festivities, the programme for which includes a banquet with the Mikado.

Ex-Governor Furnas has returned to Nebraska from his trip to the Pacific coast whither he was sent by the Department of Agriculture as one of a commission of three to investigate the fitness of some of the unoccupied public domain for agricultural purposes. He's delighted with California, especially as a fruit-bearing State.

John Merryman, the genial, whole-souled, bright, energetic John Merryman, of Cockeysville, Maryland, died last Monday. For years he has been prominently connected with the agricultural interests of the country, having been president of the American Agricultural Association, and also closely identified with several other agricultural organizations. He was widely known personally throughout the South, where he traveled a great deal, pushing the sale of the fertilizers known by his name. He had one of the finest herds of Herefords in the country. His death will be widely mourned, for to know him was to like him.

New Publications.

BEAUTIES OF SACRED SONG.

This splendid new collection of the best Sacred Songs of the day, will be a most valuable addition to our libraries, and is full of gems.

Among the authors we notice the names of Gounod, Sullivan, Marzials, Abt, Thomas, Smart and Pinsuti, and there are more than 30 others of good repute. Gounod's "Green Hill far away;" Faure's "Palm Branches;" and Abt's "Above the Stars" indicate the high character of the compositions, which are 58 in number.

Price $2.00 Boards. $2,50 Cloth.

THE BANNER OF VICTORY

This inspiring title belongs to a new SONG BOOK for SUNDAY SCHOOLS, just out. It is by **Abbey & Munger**, who made a decided success in their last book, "WHITE ROBES," and who in this new compilation, furnish a number of the sweetest melodies ever placed in a collection of the kind. 160 pages, and about as many songs, many of them adapted to the Prayer Meeting, as well as the Sunday School. Price 35 cents.

THE KING FORTUNE-MAKER

OZONE

A New Process for Preserving all Perishable Articles, Animal and Vegetable, from Fermentation and Putrefaction, Retaining their Odor and Flavor.

"OZONE--Purified air, active state of oxygen."--*Webster.*

This preservative is not a liquid, pickle, or any of the old and exploded processes, but is simply and purely OZONE, as produced and applied by an entirely new process. Ozone is the antiseptic principle of every substance, and possesses the power to preserve animal and vegetable structures from decay.

There is nothing on the face of the earth liable to decay or spoil which Ozone, the new Preservative, will not preserve for all time in a perfectly fresh and palatable condition.

The value of Ozone as a natural preserver has been known to our ablest chemists for years, but, until now, no means of producing it in a practical, inexpensive, and simple manner have been discovered.

Microscopic observations prove that decay is due to septic matter or minute germs, that develop and feed upon animal and vegetable structures. Ozone, applied by the Prentiss method, seizes and destroys these germs at once, and thus preserves. At our offices in Cincinnati can be seen almost every article that can be thought of, preserved by this process, and every visitor is welcome to come in, taste, smell, take away with him, and test in every way the merits of Ozone as a preservative. We will also preserve, free of charge, any article that is brought or sent prepaid to us, and return it to the sender, for him to keep and test.

FRESH MEATS, such as beef, mutton, veal, pork, poultry, game, fish, &c., preserved by this method, can be shipped to Europe, subjected to atmospheric changes, and return to this country in a state of perfect preservation.

EGGS can be treated at a cost of less than one dollar a thousand dozen, and be kept in an ordinary room six months or more, thoroughly preserved; the yolk held in its normal condition, and the eggs as fresh and perfect as on the day they were treated, and will sell as strictly "choice." The advantage in preserving eggs is readily seen; there are seasons when they can be bought for 8 or 10 cents a dozen, and by holding holding them, can be sold for an advance of from one hundred to three hundred per cent. One man, with this method, can preserve 5,00 dozen a day.

FRUITS may be permitted to ripen in their native climate, and can be transported to any part of the world.

The juice expressed from fruits can be held for an indefinite period without fermentation—hence the great value of this process for producing a temperance beverage. Cider can be held perfectly sweet for any length of time.

VEGETABLES can be kept for an indefinite period in their natural condition, retaining their odor and flavor, treated in their original packages, at a small expense. All grains, flour, meal, etc., are held in their normal condition.

BUTTER, after being treated by this process, will not become rancid.

Dead human bodies, treated before decomposition sets in, can be held in a natural condition for weeks, without puncturing the skin or mutilating the body in any way. Hence the great value of Ozone to undertakers.

There is no change in the slightest particular in the appearance of any article thus preserved, and no trace of any foreign or unnatural odor or taste.

The process is so simple that a child can operate it as well and as successfully as a man. There is no expensive apparatus or machinery required.

A room filled with different articles, such as eggs, meat, fish, etc., can be treated at one time, without additional trouble or expense.

☞ In fact there is nothing that Ozone will not preserve. Think of everything you can that is liable to sour, decay or spoil, and then remember that we guarantee that Ozone will preserve it in exactly the condition you want it for any length of time. If you will remember this, it will save asking questions as to whether Ozone will preserve this or that article--it will preserve anything and everything you can think of.

There is not a township in the United States in which a live man cannot make any amount of money, from $1,000 to $10,000 a year, that he pleases. We desire to get a live man interested in each county in the United States, in whose hands we can place this Preservative, and through him secure the business which every county ought to produce.

A FORTUNE

Awaits Any Man who Secures Control of OZONE in any Township or County.

A. C. Bowen, Marion, Ohio, has cleared $2,000 in two months. $2 for a test package was his first investment.

Woods Brothers, Lebanon, Warren County, Ohio, made $6,000 on eggs purchased in August and sold November 1st. $2 for a test package was their first investment.

F. K. Raymond, Morristown, Belmont Co., Ohio, is clearing $2,000 a month in handling and selling Ozone. $2 for a test package was his first investment.

D. F. Webber, Charlotte, Eaton Co., Mich., has cleared $1,000 a month since August. $2 for a test package was his first investment.

J. B. Gaylord, 80 La Salle St., Chicago, is preserving eggs, fruit, etc., for the commission men of Chicago, charging 1½c. per dozen for eggs and other articles in proportion. He is preserving 5,000 dozen eggs per day, and on his business is making $4,000 a month clear. $2 for a test package was his first investment.

The Cincinnati Feed Co., 138 West Seventh Street, is making $,000 a month in handling brewers' malt, preserving and shipping it as feed to all parts of the country. Malt unpreserved sours in 24 hours. Preserved by Ozone it keeps perfectly sweet for months.

These are instances which we have asked the privilege of publishing. There are scores of others. Write to any of the above parties and get the evidence direct.

Now, to prove the absolute truth of everything we have said in this paper, we propose to place in your hands the means of proving for yourselves that we have not claimed half enough. To any person who doubts any of these statements, and who is interested sufficiently to make the trip, we will pay all traveling and hotel expenses for a visit to this city, if we fail to prove any statement that we have made.

HOW TO SECURE A FORTUNE WITH OZONE.

A test package of Ozone, containing a sufficient quantity to preserve one thousand dozen eggs, or other articles in proportion, will be sent to any applicant on receipt of $2. This package will enable the applicant to pursue any line of tests and experiments he desires, and thus satisfy himself as to the extraordinary merits of Ozone as a Preservative. After having thus satisfied himself, and had time to look the field over to termine what he wishes to do in the future—whether to sell the article to others, or to confine it to his own use, or any other line of policy that is best suited to him and to his township or county—we will enter into an arrangement with him that will make a fortune for him and give us good profits. We will give exclusive township or county privileges to the first responsible applicant who orders a test package and desires to control the business in his locality. The man who secures control of Ozone for any special territory, will enjoy a monopoly which will surely enrich him.

Don't let a day pass until you have ordered a Test Package, and if you desire to secure an exclusive privilege we assure you that delay may deprive you of it, for the applications come to us by scores every mail—many by telegraph. "First come first served" is our rule.

If you do not care to send money in advance for the test package we will send it C. O. D., but this will put you to the expense of charges for return of money. Our correspondence is very large; we have all we can do to attend to the shipping of orders and giving attention to our working agents. Therefore, we can not give any attention to letters which do not order Ozone. If you think of any article that you are doubtful about Ozone preserving, remember we *guarantee that it will preserve it, no matter what it is.*

REFERENCE:

We desire to call your attention to a class of references which no enterprise or firm based on anything but the soundest business success and highest commercial merit could secure.

We refer, by permission, as to our integrity and to the value of the Prentiss Preservative, to the following gentlemen: Edward C. Boyce, Member Board of Public Works; E. O. Eshelby, City Comptroller; Amor Smith, Jr., Collector Internal Revenue; Wulsin & Worthington; Attorneys; Martin H. Burrell and B. F. Hopkins, County Commissioners; W. S. Cappeller, County Auditor; all of Cincinnati, Hamilton County, Ohio. These gentlemen are each familiar with the merits of our Preservative, and know from actual observation that we have without question

The Most Valuable Article in the World.

The $2 you invest in a test package will surely lead you to secure a township or county, and then your way is absolutely clear to make from $1,000 to $10,000 a year.

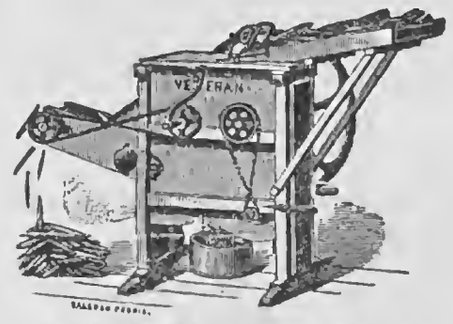
Veteran Corn Sheller



FOR HAND OR POWER.

Just the thing for Mill, Farm and Plantation.

Power and Hand Corn Shellers of all sizes and to suit all wants.

HORSE POWERS, JACKS, Etc.

Write for Descriptive Circulars and prices. Address **SANDWICH MANUF'G CO., Sandwich, Illinois.**

WATCH BUYERS, ATTENTION!

THE CELEBRATED

BAREL & COURVOISIER WATCHES

were awarded a gold medal at the Paris Exposition in '78, for greatest accuracy in performance and adjustment. These watches have all modern improvements in watch making, being stem-winders, adjusted to heat and cold and for R.R. use. By reason of improved machinery they are manufactured at a great reduction from former prices. All are warranted. *"No time, no money."* Ask your jeweler and see them before purchasing those of other manufacturers.

QUINCHE & KRUGLER, 17 Maiden Lane, N. Y., Our wholesale agents in the U. S.

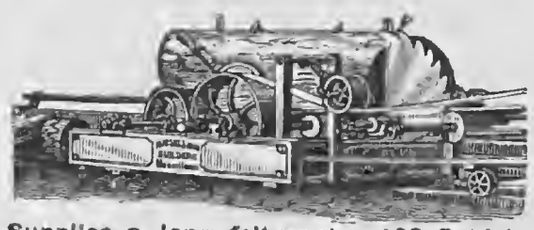
BADGER STATE

Butter Color.

Received the only honorable mention granted to any Butter Color at the International Dairy Fair of 1879. If not for sale by your dealer, send for circular, &c. to the manufacturer, E. SHELDON, Fort Atkinson, Wisconsin.

THE MASSILLON PONY MILL

STRICTLY PORTABLE.



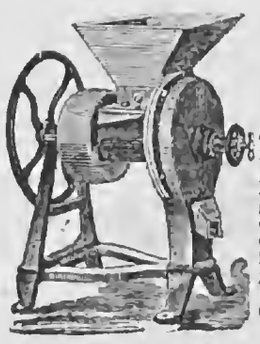
Supplies a long felt want. 100 Sold in Ninety Days.

Every owner of a Farm Engine located in moderately timbered country can find profitable employment the year round by purchasing one of these Mills.

Every owner of a timbered lot is interested in having one of these Mills in his neighborhood. No more hauling logs to mill. All the waste saved.

Write for Circulars and Price Lists, and address of nearest Agent. [Name this Paper.]

RUSSELL & CO., Massillon, O.



THE VICTORY CORN MILL.

The only mill that is a complete success in grinding corn and cob together. We defy competition on this kind of grinding. It also grinds shelled corn and all other kinds of grain, coarse or fine, as desired. Capacity *ten to twenty bushels per hour.* Self-sharpening plates, and warranted in every respect. Address THOMAS ROBERTS, Springfield, Ohio.

A GOOD SAW MILL

For $200.

Our No. 1 Plantation Saw Mill is designed to be run by 8, 10 or 12 horse-power Agricultural Engines. With this power from

1,500 to 4,000 Feet

of lumber can be cut in a day—a product 25 to 50 per cent. greater than can be cut with any reciprocating saw mill with the same power. The mills are complete except saw, and will be put on the cars in Cincinnati for the low price of $200, and warranted in every particular. Saw Mills of all sizes. Engines and Boilers, Shafting, Gearing, etc. Illustrated circulars sent free.

LANE & BODLEY CO.,

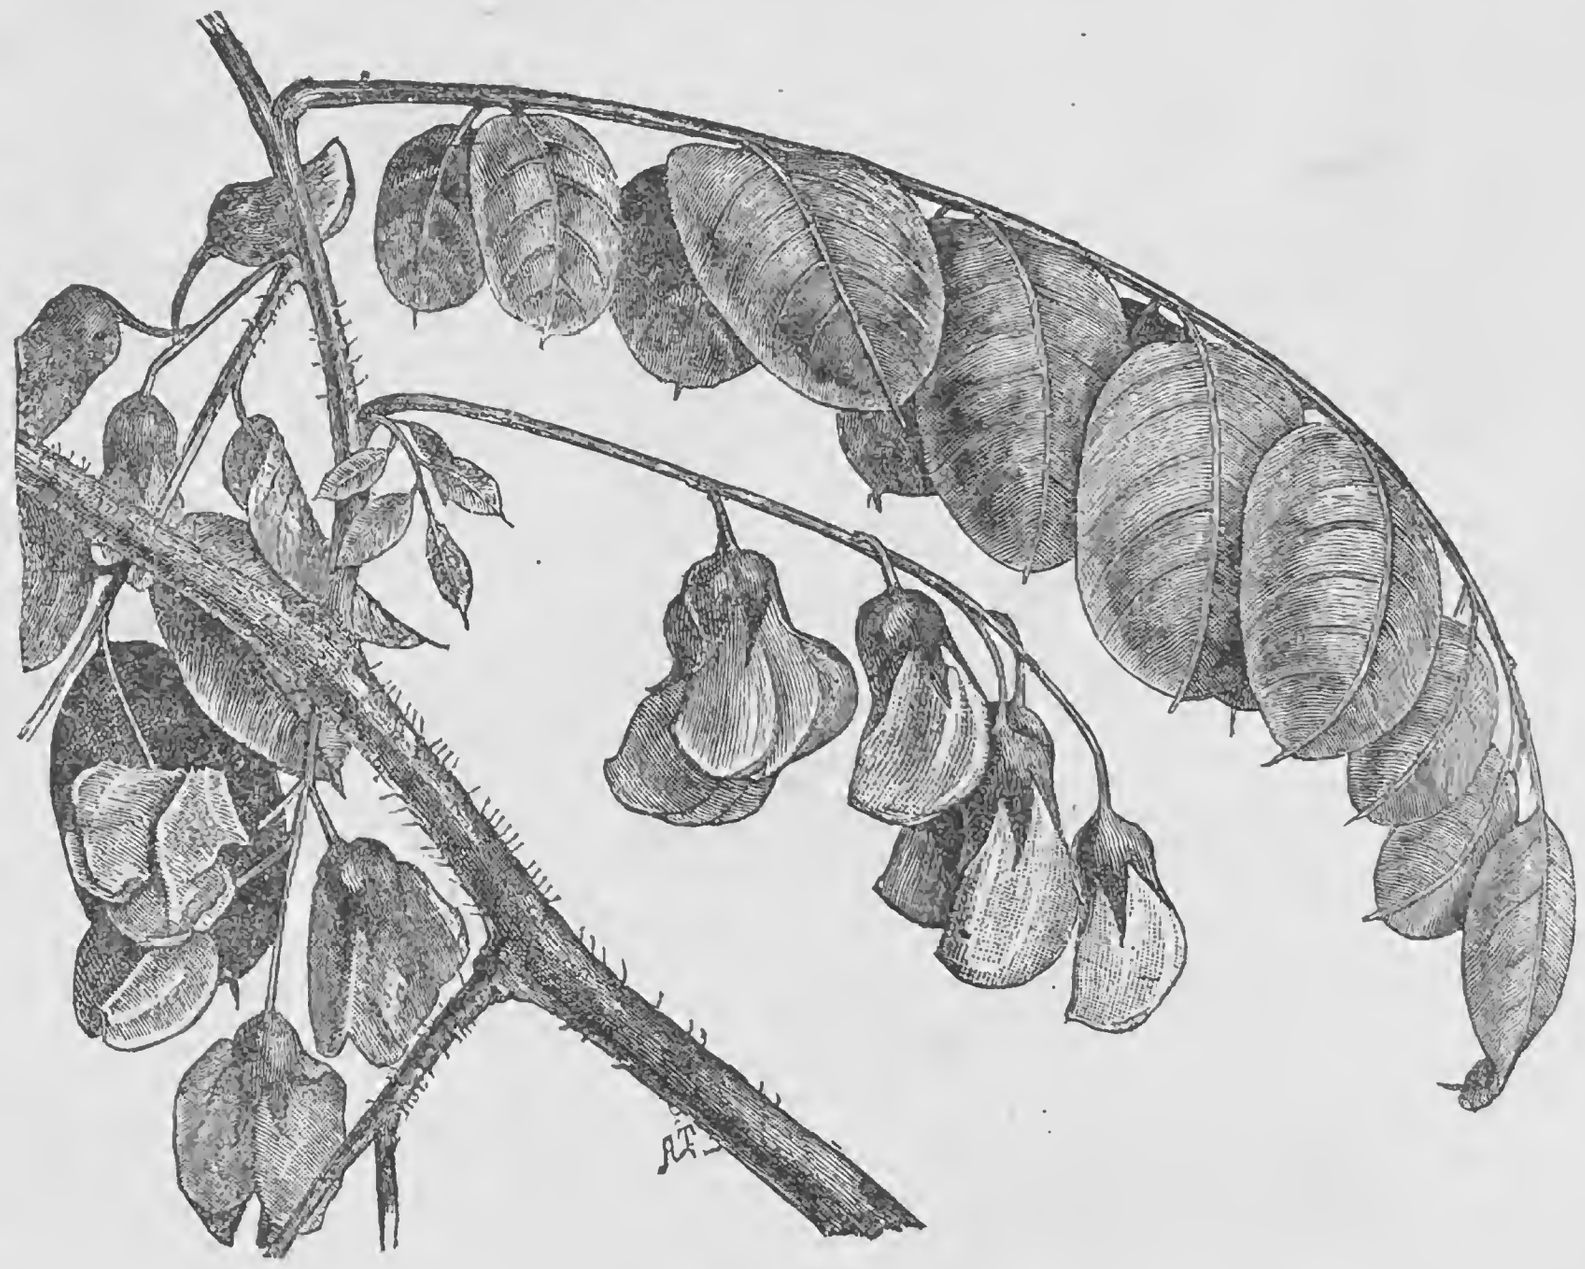
ROSE-ACACIA.—Robinia Hispida.

SAMUEL PARSONS, JR.

ACCORDING to so high an authority as Shakespeare, it matters little what we call our flowers, since a rose would smell as sweet by any other name. Rose, however, is a name surrounded with delightful recollections; and attributes of delicate grace and tropical charm are associated with the term acacia. Wise aphorisms therefore to the contrary, a pleasant interest is, perforce, aroused by the compound word Rose-acacia. The appearance of this shrub, in fact, suggests both the rose and acacia. It belongs, botanically speaking, among the robinias or acacias, and has the characteristic leaves of that genus, but in this case the leaves are peculiarly shaped or elongated so as to suggest at the same time the foliage of both the rose and acacia. Unlike the best-known hardy acacias, this species, as usually seen, is simply a straggling, trailing bush; in fact, its habit in this respect resembles that of the rose. The young wood, too, is not unlike that of some strong-growing roses, brown and mossy on young stem and twig.

One is particularly charmed, however, by the flowers of the Rose-acacia. They are rose-colored, but there all real resemblance to the rose ceases, for in all other ways they are true acacia blossoms, borne in racemes four inches long, pendent and very graceful. These flowers have the additional excellence of a long season, often nearly all Summer. Though an old shrub, having been introduced to European gardens from the Carolinas more than 100 years ago, the Rose-acacia does not, somehow, become as popular as it should. Its straggling, irregular habit is against it. The lovely flowers are trailed in the dust by heavy rain-storms, and at times its reputation has suffered unfairly on the score of an imputed tendency to succumb to the inroads of borers. To overcome this prejudice and secure a proper exhibition of the charms of this beautiful shrub, skillful pruning is necessary. There is need for the thinning out that renews and thickens the growth of young wood and consolidates the native straggling habit into the irregular bushiness that should characterize all well-grown shrubs.

A striking fashion of growing the Rose-acacia is found in the method that grafts its cions on the Robinia Pseudacacia, or Yellow Locust. By this means a great head of beautiful, pendent flowers and leaves is developed in two or three years about a stem, originally, when grafted, some five or six feet high. Here, however, intelligent pruning becomes still more necessary to prevent, during early and even later life, great masses of growing wood from being torn off during Spring and Summer gales. This method of treating the Rose-acacia has its special value for special purposes in landscape-gardening, just as budding high standard roses have secured a definite value for the attainment of certain effects on the lawn. Ordinarily, however, I believe the low, bushy form of the Rose-acacia does better, and shows its peculiar attractions in a more natural and satisfactory manner when properly disposed on the outskirts of other shrub groups or in colonies by itself.



THE ROSE ACACIA—ROBINIA HISPIDA—(AFTER THE LONDON GARDEN).—FIG. 542.

Horticultural.

RURALISMS.

APPLE trees and horse-chestnuts in flower in November are a rare sight. It is one of the curious results of the drought, of which quite an interesting list might be made. The wonderful crop of mushrooms formerly referred to was checked by a frosty night, but again made their appearance in [illegible] numbers. Cannas cut down by the frost and left in the ground have now (Nov. 11) made a new growth of three or four inches. At this time, too, salvias in sheltered places present a midsummer brightness, while roses have not looked so fresh since June, and so of other inmates of the garden. Plants, however, whose natural season for bloom is the Fall, such, for example, as the chrysanthemum, have flowered later than usual, and less abundantly. Persons curious in such things could make up a long list like the above.

THE present season will long be remembered by the gardener for its multitudes of mealy bugs. They have infested almost every thing, indoors and out. I have noticed, however, two remarkable exceptions worth noting, the Clerodendron Balfourii and Allamanda Hendersonii, two of our best hot-house climbers. I have looked in vain for a single mealy bug on either of them during the Summer, both at home and elsewhere. These two plants enjoy singular immunity from insects of all kinds that usually infest climbing plants, and I call attention to the fact for the benefit of those who love climbers, but do not grow them because of the trouble of keeping them free from insects. The Clerodendron and Allamanda require some heat to bloom them well. They are strong growers and should not be overpotted. They bloom profusely and long. I may add that they do not grow or flower well in rooms.

THERE seems now to be some doubts in regard to the real value of ensilage for feeding purposes. This is a vital point, and should be carefully looked to before going too largely into the building of expensive silos. I gather from notices in the press that ensilage is not popular in England and some farmers in Massachusetts and elsewhere report their dairy products as being unfavorably affected by its use. The RURAL, of course, will look after both sides of the question. It seems to be conceded that green fodder can be preserved in silos, and that cattle are fond of it; but what chemical changes it undergoes, and how far and in what manner it affects the products of the dairy, do not seem thus far to have received any great amount of attention.

I SHOULD judge, from the descriptions, that Mr. Parnell has the true Ott pear, and that Mr. Allen has not. It is an early pear, good to eat out of hand in its best condition, but is quite variable and only adapted to localities. It is now superseded by more desirable kinds of its season. I have known instances of variation more remarkable than Mr. Parnell's, which could only be referred to local causes. I know of several Seckel Pears (on quince stock) in the same garden, one of which always bears pears twice or three times the size of the others, the latter being of the usual size. It never produces so many flowers as the others, but the fruit is of such large size as can only be produced by thinning out. The only difference in the soil that I can perceive is the presence of a large quantity of leaf mold where this tree is planted. The soil naturally is a light loam. I have noticed a number of anomalies of this kind, for some of which I could find a plausible reason, and for others no reason that satisfied me. I could write a long chapter about such things. Who can tell me why one Chasselas Musqué grapevine should so far forget its nature as to refuse to crack and shank, while two others in the same house performed in the usual obstinate way in spite of all my care? But what a splendid grape it is when there is enough of it left to eat.

I SHOULD think the abutilon (insigne) referred to by Leon must be a beautiful plant. I have not grown it, but must now do so. A little timely pinching will doubtless keep its scraggy habit in reasonable subjection.

HORTICOLA.

NOTES AND COMMENTS.

I WOULD again call the attention of the readers of the RURAL to the editorial remarks on page 752, relative to the severe pruning which hedges often receive. I fully concur with the editor in his opinion, and to those who are so fortunate as to possess fine hedges the editor's remarks are invaluable; and one cannot but notice that the finest hedges are those that are not severely or annually pruned. While a hedge is young it, of course, must be pruned more or less, so as to obtain a uniformity of growth and increase of size; but after it has nearly attained the desired hight it should not be pruned severely, and at least three-fourths of an inch of the young wood should be allowed to remain. As soon as a hedge begins to show signs of injury, or of weakness of growth, it is an excellent plan to allow it to remain unpruned for one or two years. These remarks are especially applicable to the American Arbor-vitæ. It is worthy of remembrance that all severe pruning is a blow struck at the vitality of the tree.

IN pruning Arbor vitæ hedges it is well to remember that under no consideration whatever should a part of the tree be cut back to the old or leafless wood. I happen to know of an instance where this had been done on the side of a hedge a few years ago, and the result

is that on this side the branches are entirely dead, while the other side, that had not been severely pruned, has remained uninjured—not a break in its foliage can be seen. [Is not the reason of this that coniferous evergreens cannot push buds and form foliage soon enough to support the wood?—EDS.]

FOR an ornamental evergreen hedge there is nothing that can equal the American Arbor-vitæ (Thuja occidentalis), while for a dwarf hedge plant the Tom Thumb and Hovey's Arbor vitæ will be found indispensable. [Does not Mr. Parnell mean the feathery form of the common Arbor-vitæ? In most cases it loses these feathery leaves as the plants become old, returning to the species. Besides, this youthful form is not at all hardy at the Rural Grounds.—EDS.] The evergreen Thorn, the Yellow-fringed Cratægus pyracantha, is also a most valuable ornamental hedge plant.

A CHOICE and remarkably interesting plant for the lawn is Buist's Variegated Althæa—Hibiscus Syriacus foliis variegatis. It is of more compact habit and of dwarfer growth than the majority of the althæas. The flowers are small and insignificant, the beauty of the plant consisting in its leaves, which are curiously and beautifully marked with white. In a rich, deep soil this species grows freely and stands our hot, dry Summer weather without being injured in the least. It is, moreover, perfectly hardy. [Do the flower buds ever unfold with you?—EDS.] While the plants are small pinch back the strong-growing shoots occasionally during the season of growth. For this species this treatment seems, to me at least, far preferable to the severe annual pruning usually given the althæas.

WHILE speaking of the althæas, I desire to mention the fact that, of late, large plants die suddenly and in a manner unaccountable to me. Have any of the RURAL readers noticed this, and if so, what is the matter with them? [Asking pardon for so many interruptions, we would reply that in sandy soil, subject to drought, ours have been killed in the same way. Not so in clayey, moist soils.—EDS.]

THE Scarlet Oak—Quercus coccinea—is just now a remarkably attractive object among our forest trees. This is one of the most beautiful and distinct of oaks, on account of the leaves assuming a beautiful scarlet tint in the Autumn months, and on this account it is well worthy of being more extensively employed in planting ornamental grounds.

IT is a common opinion among most persons that deciduous trees and shrubs cannot be successfully removed while in full leaf. About the middle of June last I removed two large althæas, both being over eight feet high; they both lived and are doing well. When they were at first removed the ground was very wet; but since then it has been dry enough. The plants were very carefully taken up and replanted. They were severely pruned and as soon as dry weather set in they were well mulched, and occasionally given a good soaking of water. I do not suppose it would prove to be a very profitable operation on an extensive scale, but when it is necessary it can be done with entire success, provided a person will use a little skill and judgment. [True. We have at various times in the Summer during many years transplanted peach, apple, pear trees, deciduous and evergreen trees, grape-vines, blackberries, raspberries, etc. successfully.—EDS.]

ONE of the prettiest and most attractive green-house plants at the present time is the Catalonian jessamine—Jasminum grandiflorum. It is a plant easily cultivated, requiring good drainage and a compost composed of two-thirds well rotted sods and one-third well rotted manure, with a temperature of 50 during its season of bloom—which is from October to January. It is a plant with light, graceful foliage and deliciously fragrant, pure white, star-shaped flowers. The plants can be cut back into shape and planted out in the open air about the first of May, and taken up carefully and potted about the end of August. It is also an excellent window plant and as it is of climbing habit it can be trained in almost any desired form. It is very subject to the scale insects, and care must be taken to keep them in check. Propagation is effected by cuttings, but fine plants may be easily obtained by layers during the Summer months.

WITH me all the Winter pears are ripening much earlier than usual, I presume on account of the severe drought. One of the best in eating at the present time is that excellent sort, Dana's Hovey. In my opinion this is the highest-flavored pear in cultivation. On account of its small size, I presume, it is of little value as a market sort, but for amateurs it is without an equal. The tree is of vigorous, upright growth and is remarkably productive, retaining its foliage until late in the season. The fruit is of small size and of a greenish-yellow color, with a juicy, melting flesh and a rich, sugary, aromatic flavor.

OUT of 95 varieties of pears in my collection there are only three that have retained their foliage to the present time (Nov. 12), viz., Dana's Hovey, Michaux and St. Michael Archange. [The Kieffer still retains a few leaves with us.—EDS.]

WILL you please be so good as to inform me where I can obtain a plant of Abutilon insigne? I was of the opinion that this species was not in cultivation at the present time.

HAVE Schweidler's Purple-leaved and Weir's Cut-leaved Maples been tried at the Rural Grounds, and if so a few descriptive notes on their rapidity of growth, habit, etc. would prove of interest to me. [We have never tried Weir's, as it is simply a variety of the Silver Maple, which we have never liked as an ornamental tree. Schweidler's grows just about as fast as the species, the Norway. —EDS.] CHAS. E. PARNELL.

Field Crops.

SOME RURAL SEEDS.

WHITE ELEPHANT POTATO.—Rather late last Spring I received through the RURAL Seed Distribution two medium-sized White Elephant Potatoes, with some other seeds and packages empty from being torn open and the seed lost in the mail transportation. The potatoes were not weighed, but cut to pieces of one eye and planted with phosphate in a rich, loamy soil that had been manured with fine manure plowed in. It being late and the soil becoming considerably dry, the sets were some time in coming up, and it required vigorous fighting to protect them from the potato bug. They received ample attention and made an excellent growth of vines, but on the bottoming I was disappointed, although I obtained about one bushel of average tubers. They did not, however, quite come up to my expectations, and still I am inclined to think that their failure to do so was due to the place where they were planted rather than to any unfavorable quality of the potato itself; and here I will say that they were planted on a piece of ground that had been used several years for onions, and that was last year planted to potatoes and a portion of it was again planted this season, and it must be reported that on that portion the potatoes did not do at all well; so I am inclined to think that with more favorable conditions the White Elephant would have given very satisfactory returns. Perhaps right here I may be permitted to say that in my opinion no better soil or field can be used for the cultivation of potatoes than some old, outlying field that has not been under the plow for a number of years, and even though the soil looks thin, with a liberal dressing of manure incorporated with it and the use of phosphate in the hill, there need be no fear of a poor crop, and in such cases one will almost invariably have perfectly smooth tubers. Now one trouble with my potatoes grown on the old cultivated soil was that they were exceedingly rough and scabby, while others, grown upon a portion of old pasturing that had not been under the plow for 25 years or more, were as smooth and nice as could be wished.

RURAL BRANCHING SORGHUM.—I planted the seed of the Rural Branching Sorghum and it failed to germinate except a stalk here and there, but these, either from its being so extremely thin or from some other cause, did branch almost without limit. Judging from the indications of the little that came up I should imagine it would be a profitable plant to grow, if its saccharine qualities are equal to those of other varieties, because of the great number of stalks that would be produced, and yet there is a possibility that the number of these would be somewhat diminished in size because of an increased number from one germ. This seemed to be the case so far as my own was concerned. An important point in sorghum culture is to secure a variety possessing the highest degree of saccharine quality. A cane may furnish a large quantity of juice, but of so low a grade as to produce but little sirup and that of a low grade. [The Rural Branching Sorghum is a fodder plant rather than a sugar or sirup making cane.—EDS.]

POTATOES AND CARNATIONS.—These were taken in hand by my "better half" and carefully attended to and they rewarded her with many blossoms in great variety, richness and delicacy of coloring, that were much admired. It was a happy thought of the RURAL that prompted it to the distribution of the seeds of beautiful flowers so that the houses and gardens may be rendered attractive. There is no home, however humble, that may not be relieved of its gloom by the introduction of a few of these messengers of love—beautiful flowers. How the heart is made glad as they seem to smile upon the weary laborer, whether from the field or by the fireside, and the more there are the greater the blessing.

Tolland Co., Conn. WM. H. YEOMANS,

HUNGARIAN GRASS.

Fifteen years ago there were very few fields of tame grass in this part of Missouri, and farmers opening new prairie farms found in Hungarian and millet good substitutes for Timothy and clover. Prairie hay, unless well backed with corn, barely kept stock alive during the Winter. For several years I wintered 40 or 50 head of cattle and 15 head of horses on Hungarian without losing a calf or a colt or discovering any sign of disease. I believe it to be as valuable, ton for ton, as Timothy hay. My first crop of it was 25 acres on prairie sod broken late in the Fall and early Spring, sowed on the 1st of April, one peck to the acre; yield, 75 tons of clean hay.

I commenced cutting it on the first of July, while in the "milk." The last day's cutting, two weeks from commencement, was fully ripe. In raking the seed shelled badly on both early and late cuttings. The seed on the first cutting was small and light-colored, and though the Fall was favorable none of the seed sprouted. But the stubble of the early cutting grew, sending out several shoots to each that headed out. The following year Hungarian grew wherever it could find an unoccupied spot, all over the field mentioned, and wherever the cattle stood or fed. Around trees mulched with manure I gathered stalks six feet tall for exhibition. Hungarian has, I think, several advantages over millet. It is more hardy, can be sowed earlier, is surer to grow, stools out better, makes finer hay, and there is more blade and less stalk. It will stand more rain with less damage in the shock, stack or windrow than prairie hay or Timothy. When a badly finished stack of prairie hay rots to the ground Hungarian will suffer little.

The seed has had a bad name as food for stock; but, while I have seen no ill effects from it, I have observed that we never had eggs so plentiful in Winter until we commenced feeding it. I believe that cattle digest very little of the seed, and horses even do not digest it all, and as it yields as high as 70 bushels per acre sometimes, it would pay to thrash and grind the seed with corn and oats for stock. Early sowing is the surest. It needs moisture to give it a start; after that very few crops stand the drought better. It pays to prepare the ground well, leaving it very level, lest heavy showers wash the surface and bury the young blades. J. W. MULVEY, M. D.

Caldwell Co., Mo.

KANSAS NOTES.

Sorghum for Feed.

I have never raised sorghum for the purpose of sirup-making, but I have raised it two years for feed, and consider it superior to any other forage plant I have ever raised in any State for this purpose, Timothy and clover not excepted. I prepare the ground the same as for any other crop, and drill with my wheat drill half a bushel of seed to the acre. I sow it from April to August first. If it grows strong and tall, I cut it with a revolving-rake reaper, and, after allowing it to wilt for several days, I bind and shock it in large shocks until dried, then stack and salt it the same as corn-stalks. If it is finer and shorter, I cut it with a mower and cure it the same as hay. It takes a long time to cure and dry out, otherwise it will heat and spoil. The stacks should be long and narrow. The crop should stand until ripe enough for sirup before cutting. It will not bleach and spoil on the ground like hay or grain. Many let it stand without cutting and feed it on the ground, and cattle and sheep will eat it clean, even the butts and roots, leaving nothing. I am of the opinion that the large, coarse stalks are the best for working animals. My horses are working and driving on half rations of grain (rice corn), and are doing better than when I fed them hay and corn fodder, with full rations of corn chop. The seed is equal to corn, and will produce as much to the acre. I think when well cleaned it weighs 60 pounds to the struck bushel. It is superior to any other dry feed for milch cows. Our dry climate and winds make it easy to cure, and it stands drought better than any crop except the rice corn.

RICE CORN FOR FEED.

I have raised rice corn three years, and have had good crops each year—from 20 to 30 bushels per acre. I plant it in drills eight inches to one foot apart, one seed in a place, if the seed is good, and three to four feet between the rows. It yields well planted six to eight inches in the drill. I cultivate well while small, but after the heads are out they are liable to break off. I harvest it by cutting the heads off with a pocket knife and gathering them in baskets the same as corn, having my wagon along. Each man takes four rows, and will cut more than he could pull of Indian corn. It is liable to heat if put in too large cribs. Some thrash it with a common thrasher, and others feed it in the head. I prefer the latter method, pulling the heads apart and mixing them from bran. I have fattened hogs two years on this feed, and fed my work horses on it through wheat seeding until the corn was out in Spring, and think two bushels of it are equal to three bushels of the best Indian corn. I feed it to my sheep and rams with the same results, and have never seen any harm result from it. All stock must learn to eat it before they like it. Nothing will eat the young corn when growing. Sheep will take all the grass in the field without touching a leaf of the corn. The stalks are very hard and woody, and almost worthless for feed when dry. In early Fall the stalks will make a quarter to one-eighth as much sirup as sorghum—so I am told. It stands drought quite as well as sorghum, and I am told grasshoppers will not bother it. It makes splendid griddle cakes or puddings, when ground.

BROOM CORN.

I raised a few acres of broom corn one year for the purpose of shedding. In planting, I used my sulky plow, dropped the seed in the back side of the furrow and covered it with the next furrow, plowing wide so as not to cover it deep. It came up thick and was cultivated. I planted it July 3, the rows being about 3½ feet apart. It grew from eight to eleven feet high and the brush was of tremendous length and full of plump seed. I cut and shocked it the same as corn, and fed it to my sheep during the Winter with good satisfaction. I fed 1,500 bushels of light seed to my sheep the same Winter and they liked it for feed. My neighbors raise large quantities of it with only very little labor. The cutting is the most work. They get from 400 to 700 pounds to the acre of the brush, and 15 to 30 bushels of seed. The brush sells at $60 to $110 per ton, and the seed at 20 to 25 cents per bushel. It is used for feed for cattle, horses, sheep and hogs. H. J. COLVIN.

Farm Topics.

ICE-HOUSES ON THE FARM.

OF THE advantage of having a good supply of ice for family use in Summer it is hardly necessary to speak; yet, however much its advantages may be conceded, very many farmers forego much real enjoyment which they might have at little trouble and expense, and instead of refreshing themselves on ice-water, used moderately, and spreading their bread with nice, cool butter, they drink the warm water from the spring and cover their bread with an oil less healthful and pleasant to the taste. This is not because they do not recognize the good a little ice may do, but they "never get at the work," or "it is too much of an undertaking" to build an ice house.

Aside from the fact that ice in Summer makes living more pleasant when the mercury reaches 100 degrees in the shade, it has come to be a necessity for those who keep a dairy, if their butter products are to be first-class. But every farmer who now has none will find time and money well spent in building an ice-house, to be filled later in the season. It may be built above or below the surface of the ground, as seems desirable. I remember seeing one on a farm this Summer, which answered the purposes of a small dairy of 12 or 15 cows and furnished what ice was needed for domestic purposes. Not all ice-houses can be so favorably located as was this. Near the farm house a little fish-pond, fed by a never-failing stream, had been made some years ago. It was not more than 25 or 30 feet in longest diameter, yet when it was discovered that this might be turned to use as an "ice factory" in Winter, it afforded a sufficient quantity of ice to supply three neighboring families, whose ice houses were not so favorably located. On the lower side of this pond stands the ice-house. This, as we remember it, is not more than 10 feet by 12, with a hight up to eaves of, perhaps, 10 feet. It is built of common, smooth boards, a shingled roof and ventilator, and the joists to which the clap-boards are nailed without afford also, within, a place for nailing coarse boards, which, when fastened, form with the clap-boards a place for "packing" with chaff or straw. The door-sill is about on a level with the top of the embankment about the pond, so that the ice-cakes can be stowed away with but little labor. As I have said, this pond of small dimensions furnished this and three other families with a sufficient amount of ice for Summer use.

But, wherever the house be built, proper drainage and ventilation are indispensable. If

possible the sills should rest on a brick or stone foundation, and should incline towards a drain to secure dryness. The floor should be of cement, and upon this, when the ice is to be stored, poles, covered with straw, should be laid, so that all the water from melting ice may be carried away. For packing between the inner and outer walls, straw, saw-dust, chaff or shavings may be used. If the ice-house is to be of very large dimensions, it is much more convenient to have, say, three doors, one above the other. As to proper ventilation, various modes will suggest themselves to the builder, such as small ventilators upon the ridge of the roof, holes bored in the peaks, etc., etc., but ventilation in some way is necessary. J. W. D.

Rotten Bagasse for Manure.

I am trying well-rotted bagasse this year as a manure. A neighbor who had run a sorghum mill for several years had allowed the bagasse to accumulate until the rotting mass had spoilt his well of water near-by. He gave it all to me on condition that I would haul it away, as he did not believe it would pay to haul it out. I at once determined to test it, and hauled and spread a heavy dressing over my potato patch, which I intended to plant with potatoes again next year. On a part of this I shall apply no manure; on a part fresh stable manure, and on the balance nothing but bagasse, turning it all over this Fall and letting it lie until Spring. One thing I am satisfied of, and that is, that the bagasse is splendid for mulching. In hauling it in August, when the weather was hottest and when we had an extreme drought, I accidentally threw a pile near a citron vine that had nearly perished from the heat and dry weather and in a very short time it commenced growing, and although all the rest of the vines yielded nothing, this kept on growing and gave us a dozen fine citrons, and was full of blossoms when the heavy frost of November 3rd killed it. The Apiarian.

FACTS ABOUT BEES AND HONEY.

THERE are a few facts about bees and honey that ought to be generally known, and yet about which many people are ignorant. One fact is that bees inside of a building seldom sting. Among other apiarian implements and products that I once exhibited at our county fair, was a honey extractor. There were a few colonies of bees kept within a short distance of the fair grounds, and a few of the bees were not long in discovering that my extractor was not perfectly clean, that is, it was slightly "sticky" inside with honey, and soon a score or more of them were doing their very best in starting a "land office business." Every time a bee left the extractor there would be a dozen "Oh mys!" and a general stampede among the inspecting crowd; some of them, perhaps, getting their toes trodden upon, and others uncomfortably jostled. Whenever a man stood his ground and did not "dodge," I knew in a moment that he was a bee-keeper. There was not the least danger of any one's getting stung, but to prevent so much unnecessary alarm and annoyance I gave the extractor a thorough washing, and then there were fewer bees.

When a person is stung, the sting should be removed as quickly as possible; not, however, by taking hold of it and pulling it out, for, by so doing the poison sack is compressed and more poison is thus forced into the wound; but it should be *scraped* out, either with the finger nail or some instrument having a somewhat sharp edge. I have yet to find a better remedy for bee stings than alcohol; it should be freely applied immediately after removing the sting.

"Let's see—the drones are the ones that lay the eggs, are they not?" I could not begin to tell how many times the above question has been put to me by persons who were not bee-keepers. First, I suppress a smile, and then say: "Oh no, they are the male bees; it is the queen that lays the eggs. She is the only perfectly developed female in a colony of bees, while the workers are undeveloped females."

But if there is any one subject pertaining to bees and honey upon which the masses in general are ignorant, and upon which we bee-keepers have talked and written a great deal and upon which we shall probably have to talk and write a great deal more before it is fully understood, it is that of the difference between *strained* honey and *extracted* honey. I have no idea how many people at the fair asked me if my extractor was a *patent churn*. When honey is strained, the combs, with whatever they may contain, are mashed up, and the contents allowed to drain out. As the combs contain bee-bread or pollen, and brood, and sometimes dead and living bees and other rubbish get mixed in, the honey that drips, yes, and sometimes is squeezed from them, is, to say the least, pretty highly flavored. No wonder that it makes some folks sick when they eat it. In throwing honey from the combs with a honey extractor, nothing leaves the combs besides the pure liquid honey. As honey-comb is indigestible, extracted honey is more healthful than comb honey; and many who could not eat comb honey, because of the bad effects that followed, have found, upon trial, that they could eat extracted honey with impunity.

Every one should know that nearly all liquid honey will candy or crystallize upon the approach of cool weather; and that it can be again reduced to a liquid state by the application of a gentle heat. Let no one ever think that honey is adulterated or made from sugar because it is candied, as there is, perhaps, no better proof of its purity than this same crystallization. W. Z. HUTCHINSON.

Dairy Husbandry.

THE DAIRY COW.

HENRY STEWART.

Treatment of Diseases of the Udder.

AN attack of garget requires instant treatment; neglect may cause serious results, while immediate care may soon overcome the trouble. The treatment varies somewhat according to the peculiar character of the attack; and this differs greatly as the causes differ. The causes of garget, in which may be included all the forms of the disease, are constitutional tendency to inflammatory disease; overfeeding with stimulating food, such as cotton-seed meal, which readily provokes it; inflammation resulting from cold, as exposure to cold rains soon after calving, or by lying upon damp, cold ground; excessive muscular strain as by chasing around when the udder is filled; retention of milk, either purposely done by the owner, or by the cow withholding the milk; and lastly by a sort of reflex action upon the milk glands produced by a generally diseased condition of the cow which disturbs the circulation and forces it excessively in this direction, or which produces a diseased and irritant condition of the blood.

It is readily seen that each of these conditions may call for a different treatment, and that it would not be difficult for the owner of a cow to do mischief by adopting the advice of a neighbor or friend, who might have at one time, procured relief in a case having an entirely different origin, by the use of some particular treatment or remedial agent. In some cases it is very clear that medicine might be required; such as for instance, when the trouble is caused by some disease of the blood when this is removed the secondary effects may disappear. In some cases mechanical treatment only may be needed, as when the vessels and ducts have become engorged and the milk has clotted in them, and an alkaline injection would dissolve the solid caseous matter and enable it to be drawn away. In some cases both this treatment and medicine would be needed, as when the blood is in an acid condition during a feverish state of the system and alkaline salts may be given internally and injected into the udder as well.

Sometimes soothing outward applications may be requisite as when muscular strains or accidental blows have caused the trouble; and at other times when suppuration is probable some absorbent agent, such as iodine, may be applied and an antiseptic medicine given internally. In this case warm fomentations would be useful and it may even be advisable to apply hot poultices and to support the udder by a broad bandage carried under it and over the loins. When it is necessary to draw the milk from a disordered udder, a silver milking tube may be used, which is inserted in the teat and through which the milk flows by its own gravity. This would overcome any obstinate interference by the cow with the flow of milk, and bring it down in spite of her objections. When the milk is too ropy and clotted to be drawn in this way, an injection of one teaspoonful of carbonate of soda (common baking soda) or saleratus dissolved in a pint or half a pint of warm water may be injected into the udder through the teats. This will dissolve the thickened milk and enable it to be drawn either by the milking tube or by the hands or fingers. These methods will be applicable whenever the udder requires to be relieved of its contents, unduly retained from whatever cause.

When the cow is in a fevered condition, or the udder is greatly inflamed, tender and hot, a cooling saline medicine will be useful; this may be a pound of Epsom or Glauber salts, and if the fever is very considerable one ounce of saltpeter may be added. A saline diuretic, such as saltpeter, will always relieve an inflamed udder, as it increases the action of the kidneys and so reduces the activity of the milk-secreting glands.

When the udder is in a suppurative condition and the matter drawn from the teats is mixed with pus, hyposulphite of soda will be beneficial; this is an effective antiseptic and prevents danger from the absorption of pus into the blood. This salt is given in one-ounce doses daily and should be continued until all danger is removed. A mixture of four ounces of glycerine, with one dram of iodide of potassium, dissolved in as little water as is necessary to make the solution, will be useful to disperse a threatened abscess, or to soften the udder when it is very hard from an obstinately congested condition. The iodine is an active absorbent and has been used in such cases with the best effect. When a portion of the udder becomes tumefied, fomentations of hot water, or a hot poultice of linseed meal applied to the part by means of a broad bandage covering the udder and brought up over the back and securely fastened there and behind the buttocks will be advisable. These remedies are only suggested for the use of the owners of such cows as may be affected with garget. It is impossible to mention particularly the right treatment for every special case. Ordinary judgment and reason must be used to meet each particular case when treatment is found necessary.

In general it is easy to avoid the trouble by forethought and preventive precautions. These will do more good then a great quantity of remedies. To watch the cow, to use the best system of management, to be ahead of any difficulty, and should it come to be prompt to treat it, will usually be sufficient to avoid most of the troubles which afflict the careless, thoughtless, reckless and procrastinating dairyman.

Salt Marsh Grass for Dairy Cows.

I have seen it stated that this is not good food for dairy cows. Of course, it is not equal to upland grass, but if the cows are fed a quart or two of oil or cotton-seed meal per day, or a few quarts of wheat bran or shorts, it answers very well, and so also does fresh marsh grass. I know herds of Jersey cows that are pastured alone on such grasses all Summer, and they do well on them. Common cows will thrive in the same way. I cut such grass for hay, and during Winter my cows have no other fodder except a small quantity of corn-stalks per day. In addition to this, I give them a moderate ration of Indian meal and wheat bran, mixed half and half, also a pint each night of oil meal or cotton-seed meal. Be careful and get them *pure*, for dealers now *adulterate* them badly with plaster-of-Paris, or some other cheap, injurious stuff. If roots are on hand, they will answer very well instead of the meals and bran above. Sugar beets, parsnips and carrots are best, though mangel-wurzels do pretty well. Turnips give a bad taste to the milk. Fed as above, my cows average five to six pounds of first-rate butter per week per head. C.

The Horseman.

EASTERN MARKETS FOR WESTERN HORSES. No. 2.

L. S. HARDIN.

I HAVE gone somewhat over the ground of Eastern horse-breeding and pointed out wherein it does not keep pace with the market demand of the Eastern cities. There seems to be no doubt that the chief evil lies in the desire of farmers to raise small, fast horses instead of large draft horses. It is a question whether you will raise a horse to sell to a street-car company at $100 or one to sell to an express company or a merchant at $200 or $300. It needs but a short experience to prove to any man of average intelligence that the profit in raising fast horses depends far more upon chance than it does upon superlative judgment. It would therefore as a business be classed by insurance men as "extra-hazardous." I do not consider it a fair field for hard work and honest rewards.

When we come to the question of raising draft horses as a business we have altogether another matter to deal with. Here undoubtedly honest and intelligent work will meet with an appropriate and satisfactory reward. In order to tell how best to accomplish that end, we must first study well the market demands, and then the easiest and most profitable methods of supplying those demands. In relation to the market, I have studied the New York market particularly, and presume it to be a fair sample of what the demands are for draft and carriage horses in all the large cities of the East. Prices may vary somewhat as the city lies contiguous to, or far away from, the grazing sections of the country where horses are bred in the greatest numbers. The horses that I consider the most profitable to raise may be classified in accordance with the purposes to which they are put. They are carriage, street-car and express, or heavy draft horses. The first class of horses, or such as are used in omnibuses, street-cars and hacks, are of various weights from 1200 pounds down to the runt of a pony, and sell in the New York market all the way from $130 down to a song, the price depending more upon soundness and style than on any other feature. These horses are mostly raised in New York and the contiguous States and probably, as a rule, cost the farmer from $20 to $50 a head more to raise and market than they sell for. The ruling prices for this class of horses are from $100 to $110, the figure depending mostly upon the degree of soundness the horse possesses. Horses are bringing on an average, $10 more than mares; for there is always danger of mares proving to be in foal when purchased, and a mare in foal is a source of great loss and annoyance to city owners. They have no pastures to turn her on, and keeping dam and foal in a city stable and on grain is almost too expensive a method of colt raising.

There is a limited but high-priced demand for fine carriage or park horses. The prices range from $400 all the way up to one or more thousand dollars, depending more upon style, carriage and color than speed or size, though the weight must be upward of 1400 pounds. To meet this demand the horse should carry a high head without a check rein, and the higher he lifts his front feet when trotting, the more money he will bring. Why this style of horse is not specifically bred for, is a mystery in the history of horse breeding. I have known as high as $5,000 to be paid for just such an animal. The market for this style of horse being limited, it might not pay for large numbers of breeders, but at present it looks like a most inviting field for special breeding.

I now come to the most interesting branch of this subject; that is, furnishing the large cities of the country with first-class draft horses. To determine the best method for accomplishing this end, we should first find out what is wanted. I have interviewed several managers of the horse departments of large firms that use heavy draft horses. The horse that seems in most demand is heavy, chunky, pony-built, with rather short legs in proportion to his weight, and to meet these requirements the half-bred Percheron is most decidedly the favorite. The Clydesdale seems a little too leggy to meet the general demand. On all the favorites that were pointed out to the writer, the inevitable long hairs on the fetlocks were to be seen, as also the short neck and rounded ham of the Perche horse. These horses rarely stand over sixteen hands high, though they weigh over 1600 pounds. The favorite colors were dark bay and brown, which is a point the breeder should never overlook. The prices paid for this class of horses range all the way from $300 to $800 apiece. There has always been a lurking suspicion abroad that the Percherons had tender feet that would not stand our hard pavements. One of the managers with whom I talked had 55 large, splendid draft horses under his charge, and I looked them carefully over with him. He said he had had trouble enough with the feet of pure-bred Percherons, but the feet of half-breds were as sound as those of any other horses in his care. This statement was supported by my own close observation among his horses. Fully one-half of these 55 horses at work in a wholesale grocery showed decided signs of Percheron blood.

The Herdsman.

PURE-BRED DAIRY STOCK IN MISSISSIPPI.

ONE day last week, occurred one of the most notable indications of the great revolution the industries of the Southwest are undergoing. The event was the sale of thoroughbred acclimated Jerseys, Short-horns, Galloways, etc. This stock was from the herds of Alabama and Mississippi stock-raisers. It marks a great epoch, as it is the first sale of acclimated thoroughbreds ever made in the Southwest. Its results surpassed the most sanguine expectations of the promoters of the scheme; and prices were eminently satisfactory. I predict that Meridian will be the great mart for the annual sale of thoroughbreds hereafter; at least, it is in the power of the interested parties to so make it. Thither will resort all the foremost men to buy their stock, from Mississippi, Alabama, Louisiana, Texas, Georgia and Florida. East Mississippi is certainly the most prominent center for acclimated thoroughbred Jerseys in the Southwest. This is said in no spirit of derogation of Alabama or any other point. Certainly there are notable Jersey breeders in Alabama; and Mobile possesses as ambitious and discrimina-

ting breeders as any place in the Southwest, and the strides that are being made are wonderful. But East Mississippi "has got the bulge" (to use a Southern phrase) on Jerseys. She started in the business years ago when stock-breeding looked as chimerical to the masses as silk-raising does now; and she reaps the reward in her great reputation as the center, *par excellence*, of thoroughbred Jerseys.

How often have I predicted the day when our stock-breeders, particularly our Jersey breeders, would be selling their stock to Eastern breeders, and when we should have the monopoly of the sale of thoroughbreds to the Southwest, because of our acclimated stock, and yet how wild such a prediction must have seemed to the average reader! And now the day is here. Eastern breeders are paying fancy prices for thoroughbred Jerseys raised in East Mississippi. The demand is greater than the supply.

There is a "big boom" in Jerseys everywhere in Mississippi now. Let it run and swell and widen and sweep! It is the sure precursor of our cheese factories. In a few years, with this stock largely distributed, East Mississippi will be the center of the greatest cheese interest in the Southwest; will be furnishing most, if not all, the cheese for the South, and will be sending fancy cream-cheeses to Europe, if not to the North and West. Shorthorns, too, will soon command a more respectable status under the kindly auspices of the Stock-Breeders' Association of Mississippi. This organization, not three years old, has "done wonders" for stock-breeding in Mississippi and adjoining States.

Meantime, thousands of acres of the rich prairies of East Mississippi are being set in clover and Blue Grass. I know of one gentleman who has about 150 acres in clover and will sow 200 more. Some men, with farms of 1,000 acres or more, talk of seeding down the *whole* area to the cultivated grasses. Some are sowing Lucerne largely. Soon will be seen in East Mississippi large areas which will be green the year round and dotted with Jerseys, Short-horns, and sheep, and this will make a "most living landscape," indeed. There will then be no prairie lands, that once sold as high as $125 to $150 per acre, "going a-begging" as now at from $8 to $15.

Truly, the sale of thoroughbred acclimated stock at Meridian was a "red letter day" for the stock-breeders of Mississippi and Alabama. All hail to them for the beneficent success! M. B. HILLYARD.

Mobile Co., Ala.

STARTING STOCK-RAISING IN TEXAS.

I started here in the sheep business by herding a flock, as I could get nothing else to do. I herded one month for $15; I then went through the shearing season for a little pocket change, and then, as I was acclimating, I became a little sick, and fell into the hands of a hospitable family on the Nueces River. Here my board did not cost me any money, as I was rather handy around the house doing chores. When I recovered I took charge of a ranch on the Sabinal for the small sum of $20 a month. Here I worked seven months, and at the end of the first year I found myself in possession of 100 sheep, and so I have gone along until I have now 1,000 head of good young sheep, and if I had been a healthy man I could have doubled that number. The first thing is to get a ranch or range for the stock. The price of sheep depends upon their quality—from $2 to $4. There is a difference of opinion about the profits from the different sorts. Mine are Mexican ewes and the best Vermont Merino rams. The range of pasturage is good, but has now to be bought or leased. The natural increase of the flock is about 80 per cent. one year with another. The fleece sells for from 15 to 30 cents per pound. Our chief market is San Antonio and the net profit of the business is 33⅓ per cent. It is already of enormous extent, but nothing to what it will be in five years from now. The wool has to be taken to market by wagon for 100 miles. Muttons are generally sold at the ranches and driven by the purchaser; they generally bring $2 per head. They are now selling for from $1.75 to $2.25, and buyers are looking for them. It is hard to tell the best parts of Texas for sheep-raising, as the business seems to thrive all over the State. Everybody is going to raise sheep, and cattle are being neglected.

This is the greatest country in the world for horse raising. I do not see why some Eastern horse raisers do not come here. It does not cost $10 to raise a horse in Texas. The animals keep fat on the range the year round, and it is a business I would have started in had I capital to go North and buy large mares. It will pay here 33⅓ per cent. per annum. Horse stock does better here than any other stock, and with less care. This is just the country for such men as Powell Bros. with their Clydesdales.

Nueces Co., Texas. H. N. DIMICK.

TEMPER OF POLLED CATTLE.

"Stockman," in the RURAL of November 26, says he has seen a man quickly lifted over a fence by a polled cow, that polled beasts push and strike with their heads in the manner of other cattle quite as savagely, and that the proportion of cross or savage cattle among the polls will be found quite as great as among the horned. A juvenile visitor to a city "museum," the other day, saw there a couple of Zulus, one of whom was cross-eyed, and in writing an account of what he had seen, said:—"The Zulus are an ugly people, and half the race are cross-eyed." Hasn't "Stockman" been generalizing in somewhat the same liberal fashion with regard to the temper of polled cattle at large from the conduct of that particular excited polled cow? My acquaintance with hornless cattle began upwards of 30 years ago, during a lengthy boyish visit to County Limerick, Ireland. My host had among his other cattle half a dozen or so dark-red, low-bodied polls, good milkers and great favorites for their peaceable, quiet disposition. In the neighborhood there were several other polled beasts that had the same reputation. The common name for them there was "maiwls" as nearly as I can spell it phonetically after so many years. Whether it was merely a local name, or whether the word was Irish or meant for English I know not. Since then I have had considerable knowledge of polled cattle, both in England and Scotland, in herds, and where a few beasts were "mixed up" with horned cattle, and their general reputation has always been exceptionally high for a gentle, non-belligerent temper. Occasionally a naturally truculent beast could be found, and sometimes an animal would "show fight" from some temporary cause, but any display of ill temper in a poll was always regarded as something unnatural, and was, therefore, productive of special dislike towards the offender.

The writers of standard works on cattle supplement their own knowledge of the different breeds with that of others more intimately acquainted with their special characteristics. What, then, have well known writers who have spoken of polled cattle, said of their temper?

"The Galloway cattle are generally very docile. . . . It is rare to find even a bull furious or troublesome," said Youatt, 47 years ago. Of the Polled Angus he said, "Some of the first qualities which seem to have attracted the attention of breeders were the peculiar quietness and docility of the doddies, the few losses that were incurred from their injuring each other in the stalls, and the power of disposing of a greater number of them in a small space." It is a well-known fact that dishorned cattle feed better and are much quieter in disposition than horned beasts of the same breed, and this tendency to quiet and peace increases with the length of time the conditions favorable to it endure. Certainly therefore polled cattle have not grown more savage or pugnacious since Youatt, the first well known authority concerning the polled breeds, thus wrote of them. The latest authority on the various breeds of cattle is Professor J. P. Sheldon, author of that fine work "Dairy Farming," just completed. In it he says of the polled breeds:—

"Yet the mere fact that they have no horns is a most valuable recommendation of these cattle. Nature gave horns to cattle for purposes of defence and attack, and in a wild state the animals no doubt required them at times; but in a state of domestication horns are not only useless, but a source of danger, mischief and inconvenience. If, in the breeding of all kinds of cattle, horns could be abolished, the gain would be great. The Americans are turning their eyes wistfully in the direction of hornless cattle, because of their superior handiness for the cattle trade to England; and, indeed, there can be no question that in no single instance would the absence of horns be anything but an unmixed good. The cattle would be less spiteful toward each other if they had no weapons wherewith to put their spite into practice, and very little harm could be done by bare heads only. There has been an outcry against the cruelty involved in the practice of dishorning cattle—that is, cutting off the horns close to the head—but in some circumstances there may be less of cruelty in that than in leaving them in possession of weapons with which to rip each other up when they get a chance to do so. We do not, however, advocate cutting off the horns of cattle, but we do recommend the breeding of animals to whom a beneficent nature has denied those terrible weapons."

Were there room or necessity I could quote a dozen opinions of the same drift as the above, from writers well acquainted with the animals criticized. "Stockman" says, "Let us have the truth anyhow, and give the polled cattle their due." So say I, and to this end let some of those who know about them tell what they know to the RURAL. If Stockman's experience, or, rather, observation, has led him to believe that the proportion of savage animals among polled is quite as great as among horned cattle, the result of his observation is, I am sure, exceptional.

Cattle in Transit.

In the same column "Stockman" also belittles the advantages polled have over horned cattle in the matter of transportation by rail or on ship-board on the plea that the latter get more room—that their horns secure them ampler breathing space, and are therefore an advantage by preventing over-crowding. My observations both by rail and steamer have been different from his with regard to the packing of cattle. Wherever I've seen beasts crowded in transit the width of the body not that of the horns has gauged the room for each. If in this connection any regard is ever paid to the spread of the horns, it should be in case of the uncouth Texans: but with these I've seen the rule I've mentioned frequently exemplified on the cars between Abeline and St. Louis, and on ship-board between Indianola and Havana, and often also very considerably nearer "civilization." Who that has beheld cattle packed in transit has not pitied them for the evident inconvenience and misery resulting from the possession of horns! I speak of cattle closely packed—not as you always but as you often see them. They cannot move their heads without clashing or interlocking horns, and already irritable from hunger, thirst and general misery, what wonder that at each such contact they are apt to use their weapons offensively? And whenever a wretched beast falls or lies down, and straining and floundering is prodded to his feet again, what an inconvenience are not his horns to himself and what a cruelty to his neighbors. I've never seen polled cattle in transit either by rail or water, but in view of the wretchedness and injury caused by horns when their bearers are closely packed, very little logic or imagination is needed to see the great advantage of their absence. X.

NOTES ON THE CHICAGO FAT STOCK SHOW.

Believe what the papers say about the fat stock show, and you'll think it was a brilliant success in every respect—or nearly in every respect; for all agree that the sheep and swine exhibits were small and rather poor—but, then, all agree they were better than at any former show, There is a growing feeling against an excessive amount of fat in any animal whose careass is intended for human food in the shape of meat, however desirable an extraordinary quantity of fat may be in in a carcass which is to become human food in the shape of lard, butterine, oleomargarine or hog or bullock cheese. This growing feeling found vent at the show in a general expression of gratification that the steers exhibited were somewhat lighter than those shown last year; while the quality of the meat is pronounced to have been better.

Just as at every cattle show I have heard of or seen this year, the question of the appointment of the right sort of men as judges has here caused not a little bickering and heart-burning. This was most noticeably the case in regard to the sweepstakes prize for the best steer in the show awarded the grade Short-horn McMullen, as mentioned in my last communication. It is to be hoped for the sake of the success of such exhibitions, the due reward of merit, and the avoidance of recrimination and legitimate discontent, that more care and better judgment will in future be bestowed on the selection of judges for all the cattle shows throughout the country.

This show is held under the auspices of the State Board of Agriculture, and despite the loud boasts of its success, the attendance has always been so meagre that it has never paid expenses, and the managers have now to face an aggregate indebtedness of $4,000 at the close of the last brilliant triumph. The Board is at present pondering what additional attractions can be introduced at the next exhibition so as to render the fair self-sustaining. To attract city folks is the great object, and for this purpose it is probable that, if a suitable building can be found, the next show will be held in a smaller structure than the Exposition Building, which, unlike the latter, can be heated in case of such cold weather as prevailed during the show of 1880. A kennel show, a larger poultry show and several other attractions are projected, among which it is fortunate that there can hardly be a place for a "horse trot" that last disreputable recourse of agricultural fair managers.

The polled cattle about which one hears so much, were "noticeable by their absence." In view of the fact that the present "boom" in this sort of stock is largely due to their triumphs at the great Paris Exposition of 1878, it certainly seems advisable that their adherents in this country should prepare to make a fine exhibit of them here next year. It will be remembered that at the Paris show a polled Angus herd, which I recollect the RURAL illustrated at the time, won the grand prize of honor for the best group of foreign cattle, and also the French Agricultural Society's prize of 2,500 francs for the best lot of beef-producing beasts in the whole exhibition, against the best beef breeds of England, France, Italy, the Netherlands, and some of the German States. The triumphant herd has since been scattered to the winds or led to the block; their breeder, Mr. W. McCombie, of Tillyfour, Aberdeenshire, Scotland, fills an honored grave, but their joint victory in attracting the attention of the world to the great merits long possessed by the breed, has begun for it a "boom" which it would be wise to keep going by the same means by which it was started.

The Hereford men, although they have failed to secure the chief prize of the show—the sweepstakes for the best steer—have good reason to be contented with the measure of success they have achieved and the plausible grounds for discontent and grumbling, forced upon them. A well-grounded excuse for caviling at defeat, properly dwelt upon, is almost, if not quite, as good as a victory for advertising purposes, and the aptitude as well as the record for grumbling at premium awards, possessed by one or more of the Hereford men is so distinguished that the present opportunity will undoubtedly be turned to the very best advantage. The Herefords are certainly advancing rapidly in public favor for the purpose of "grading up" for beef the "native" herds of the country. Quite a considerable number of feeders and some breeders of Short-horns for this object have either taken the Herefords in preference or are now testing the relative merits of the two breeds by keeping some of each. Among these the latest convert to the merits of the White Faces of whom I have heard, is the Hon. Matthew C. Cochrane, owner of the famous Hillhurst herd of Canadian Short-horns—one of the best breeders on the continent. He has just received from Liverpool a lot of 86 pedigreed Hereford bulls selected by his son from the best English herds. He will place his new acquisition on his Bow River ranch where he has now 5,000 cattle which he intends to increase to 30,000 head within the twelvemonth. His success with Short-horns has been great, so that a strong opinion of their merits could alone have induced him to invest so heavily in Herefords.

I have just received a copy of the RURAL containing my report of the show and find a couple of mistakes in the account given of the Short-horn grade McMullen. He took the sweepstakes prize, not in the two-year-old class as therein given, but in the three-year-old class as stated in giving his age at 1237 days. His average gain per day was not 61 pounds, but 1.61 pound, as may also be seen by dividing his gross weight, as given, 2,095 pounds, by his age, 1,237 days. I am convinced my "copy" was correct, so that the errors must have some other source. H. W.

NOTES FROM CYDONIA RANCHE.

To Cure a Kicking Cow.

It was in the heat of Summer and the hight of fly time. I had just bought a cow and calf. She was said to be true, but she wasn't. As milk was what I wanted, the calf was taken away at once, and I proceeded to milk; but such a storm of heels as played about the stable for fifteen or twenty minutes never has been portrayed in prose or poetry! Fire flashed from her eyes, lightning from her tail and thunder from her hoofs. In short, she was a notorious kicker, and the owner knew it.

I tried hard to let patience have her perfect work, but it didn't work on the cow. Nearly disgusted I went to the house, picked up the RURAL, my eye caught the "Vices of Cows," by Dr. Stewart, and mentally I exclaimed, "Eureka!" But, alas! it suggested only a lesson in moral suasion. However, I tried it again and again to no purpose. It was not moral suasion that she wanted, but a lesson on the fitness of things, and I proceeded to fit her in *this* way: She was securely fastened in a stanchion, and a stout strap with ring and rope attached was buckled around her right leg. Her leg was drawn back to the natural position and the other end of the rope fastened a few feet in the rear. Of course, the kicking went on with vigor, but it did not interfere with the milking, as she could not get her foot forward of the perpendicular. She soon tired of that game, but commenced with the left foot, and she did it with such science that I could hardly keep the foot out of the pail. I then fastened that one back, and let her kick it out. To her great consternation she was mastered, and I milked her with the calm assurance that she couldn't kick me or put her foot in the pail. I continued to fasten the right leg for a while until, like the Western emigrant's hens, she came to rather like to have her foot fastened, and would put it back to position, when she felt the strap. And now she is as kind as any cow in the herd.

MORAL.—There is undoubtedly a place for everything; but moral suasion in a vicious cow's heels does not stick worth the trouble of putting it on. And yet I would not be understood to mean that kindness has no place in connection with power, for it has.

ANOTHER MAN THAT CANNOT SEE BEYOND THE PRESENT CONTENTS OF HIS POCKET-BOOK.

Col. Curtis's note about the man who could not go the extra dollar for a "blooded" boar reminds me of a neighbor's idea of the value of turkeys. One of my bronze gobblers had strayed over to his place and he proposed to buy him. He offered a dollar. As he was a neighbor I thought I would sell him for a dollar and a half, though I knew he was worth two. But he would not give more than a dollar for any turkey, which was all *his were* worth. I took the gobbler to town, and sold him by weight alive, 22 pounds at nine cents, and it did not cost much if any more to raise him than one of the dollar kind. W. S. C.

Washtenaw Co., Mich.

Atlanta Exposition Notes.

The second weekly show of cattle could not be called a success, as only two exhibitors put in an appearance. Col. R. Peters, of Atlanta, Ga., exhibited a fine lot of Essex swine in good condition. The Essex are great favorites in this section, as they mature early and fatten from 150 to 250 pounds. With proper care and attention they can be run up to 500 pounds at two years, but large, fat hogs do not seem to do as well here as smaller animals, and for that reason the Essex have taken the lead. Col. Peters also showed a flock of Spanish Merinos, small in size, finely bred, and with a fine quality of wool. They were exhibited fresh from the pasture, and therefore were not in very fine show condition. The Colonel is breeding off the neck folds, as he finds it hard to get good shearers in the South, and that a smooth sheep is therefore more easily handled. The Merinos do well here, but run very small alongside of their Northern compeers; they average about six pounds to the fleece, and from 85 to 100 pounds to the carcass gross. All the housing they get is in extremely cold rains. At other times they run at large.

A. H. Davenport, Lexington, Ky., showed a fine flock of South Downs—large, heavy sheep, with remarkably fine forms and wool. I failed to find anyone that could tell me anything about how this breed would succeed in the Cotton Belt.

The chief feature of the show was the Angora goats exhibited by Col. Peters, who has been breeding and importing them with success for the past 30 years. He bought out the original importation of Dr. Davis, of South Carolina. The large goats shear about eight pounds and kids and yearlings about five pounds each. The wool or hair is now worth from 70 to 90 cents per pound, and as the goats need but little more shelter than the Merino sheep, they will eventually prove a very profitable addition to the wool interest of the South. W. H. K.

Atl nta, Nov. 12.

The Swine-Herd.

HEALTHIER PIGS AND PIG MEAT.

COL. F. D. CURTIS.

YOUR contributor B. F. Johnson, in a recent article on corn feeding and its effects on pigs in producing disease and making over-fat pork, reflects my ideas expressed in the RURAL some time since. I am glad to see that so able a writer has taken up this subject which I consider to be very important in a sanitary point of view both in regard to the pigs and the consumers of pig meat. I know from experience that exclusive feeding on corn will produce inflammation of the bowels and cause pigs to die. I lost several at one time before I discovered the cause. After they were dead they turned black under their bellies, which led me to surmise the seat of the disease. Some of those living in the same lot upon examination were found to be quite red beneath the bowels and the surface under their bellies was felt to be hot, which plainly indicated an inflamed condition of the stomach and bowels. These pigs were saved by a complete change of diet to wheat middlings and vegetables. The pigs were about three months old.

I recollect that my father had a number of pigs about eight months of age that had been fattened entirely on corn and which became stiff (foundered) and refused to eat so that they were nearly worthless. This foundering was on account of fever or inflammation which affected the whole body. Old hogs will endure more of this kind of feeding without showing its effects; but it is evident that they must be more or less affected by it and the meat proportionately feverish; old hogs would not endure an extended feeding upon corn without evincing disease.

When potatoes yielded more abundantly then they do now, farmers used to fatten their pigs on them. They were boiled and mixed, while hot, with peas, which were raised extensively for fattening pigs. This was a healthful combination of food and made pork at a cheap cost. When the potato crop failed, corn was substituted. No one ever heard under the former system of hogs being foundered, or of hog cholera. These troubles will continue so long as corn is made the exclusive food of pigs. The remedy lies in lighter food or in a mixture of vegetables with corn. Mangels can be made to take the place of potatoes. We feel certain that with this combination, and cleanliness, there would be no hog cholera. We are quite sure that wheat middlings fed with corn, or alternately, would also keep pigs in a healthy condition and fatten them satisfactorily.

Another remedy, partial at least, could be inaugurated by not attempting to make pigs so excessively fat, requiring so long a diet. This is a practice which has grown with corn feeding to such an extent that modern pork is really unsuited for human food, as human stomachs have not kept pace with it, and have not been educated to digest lard. Less corn and less fat would make pork more desirable for food; and a shortening of the time of feeding would also reduce the amount of fever and liability to disease. Two hogs moderately fattened instead of one stuffed and gorged to the extent of helpless obesity would be a sensible solution of the problem, how can pigs be made healthier, and fitter for human food.

Entomological.

THE NEW INSECT PEST ON PEACH TREES.

IN reference to this fresh foe of the orchardist, first described by Mr. A. J. Caywood, in the RURAL of November 12, that gentleman again writes to us: "Since the date of my last communication I have given more particular attention to the insect which is preying hereabouts on peach trees. I now know positively that the egg is deposited in or on the bark of the tree, as I have discovered the larvæ in the bark, and it is now certain that it goes through the same changes that other insects of this class do—from egg to larva and from larva to fully developed insect; but the query is; after coming to the surface for what purpose does it bore a new hole and place itself under the bark again? I have seen them do this in great numbers. I found the larvæ in a dead tree, in the bark and also under the surface of the wood, but I have found none in the living trees, I supposed the reason for my failure to do so was that examination was not made earlier in the season. Their being found so late in the season in the dead trees and not in those alive, is proof that their transformation has been prolonged for the want of proper food which the dead trees did not afford. Most likely the eggs were deposited while the tree was living. Sections of living and dead trees containing insects and larvæ have been sent to several entomologists. I have examined many other kinds of trees during the past week and have found these beetles infesting the wild cherry, all of the cultivated varieties and plum trees. They do not seem to injure the cultivated cherries to any great extent." A. J. C.

Ulster Co., N. Y.

Miscellaneous.

What Others Say.

MORTGAGED FARMS.—We make the following extracts from an address delivered recently at an agricultural fair in San Antonio, Texas, by the Rev. W. H. H. Murray, better known as "Adirondac Murray," formerly a famous preacher of Boston:—"If I were to be asked what I consider one of the most necessary things for Texan development, I should say cheap money, and say to the financiers who are growing rich upon the high rates of interest upon the money they loan to agriculturists, that the agriculture of no State has ever succeeded, nor can it succeed when the interest paid for money loaned is over seven per cent., and whenever it exceeds that figure you will find the farms mortgaged; and farmers with mortgages are great drawbacks to any State's prosperity. The mortgages get foreclosed and the farms and the State suffer. I can take you through New England and the West and show you farmers who do not own their farms, and next to negro slavery I know of no slavery more accursed than that endured by the farmer whose farm is mortgaged. It is not endured by the one alone, but by three, five or seven, or all who compose the members of the family. I think I can feel for and have the most complete sympathy for the man who has his farm mortgaged, and I think I know something of the fight he has to make with it."

THE New Hampshire Patriot says that an insect is destroying spruce trees in northern Maine and the provinces. The female lays an egg in the bark, and the grub which hatches bores into the tree. The female is a deep blue-black, has a white spot behind each ear and a long horn, with a lance-shaped head, on her tail.

AN IDEA of the immensity of some of the cattle ranches of Texas, Colorado and New Mexico can be gained from a summary of the interests owned by Mr. J. Z. Prowers, of Bent County, Colorado. Mr. Prowers, we learn from the Chicago Tribune, has at different points on his ranch 40 Short-horn bulls and 34 of the same classes of pure-bred Herefords. From these stocks of thoroughbred cattle he supplies himself with enough bulls yearly to grade up his native cattle, which number nearly 18,000, and whose grazing facilities embrace 100,000 acres of arable pasture, all fenced, and the property of Mr. Prowers. The property has a water-front on the Arkansas River of 40 miles, and it is estimated that there are already erected over 100 miles of fences. Mr. Prowers has sold this year over 1,100 head of fat steers, averaging about 1,200 pounds each, and his sales of cattle this year are not less than $80,000.

HORSE SENSE.—The horse has the smallest stomach, in proportion to his size, of any animal, says a speaker before the Salem, Mass. Farmers' Club. Fifteen or sixteen quarts are its utmost capacity. This space is completely filled by four quarts of oats and the saliva that goes into the stomach with them. Horses are generally over-fed and not fed often enough. For a horse with moderate work, six or eight quarts of bruised oats and ten pounds of fine hay a day are sufficient. This should be fed in at least three meals, and is better if fed in four. A horse's digestion is very rapid, and therefore he gets hungry sooner than a man. When he is hungry he is ineffective, and wears out very rapidly. Water fills the stomach, lowers the temperature and dilutes the gastric juice; therefore, a horse should not drink immediately before eating. Neither should he be watered immediately after eating, because he will drink too much and force some of the contents of the stomach into the large intestines, which will cause scouring. Scouring is also caused by too rapid eating, which can be prevented by putting half a dozen pebbles half the size of the fist into the manger with the oats. Give only a moderate drink of water to a horse. A large drink of cold water before being driven will have a very quieting effect on a nervous horse. A race-horse always runs on an empty stomach. Digestion progresses moderately during exercise, if the exercise is not so violent as to exhaust the powers of the horse.

A FEW WORDS ABOUT CANARIES.—All birds at this season require extra food, says the Bird Magazine. Canaries should have, all through the year, German Summer rape, Sicily canary and millet seeds mixed in equal parts, and care should be taken to have the seeds fresh and of the best quality. In addition to the seeds, feed canaries daily one-fourth part of a hard-boiled egg, both yelk and white, and mix with it as much cracker dust as can be taken upon a ten-cent piece. Fresh water, both for drinking and for the bath, and plenty of coarse, washed gravel daily will usually keep a bird in health. Twice a week give a piece of sweet apple or lettuce. If the bird has not yet finished molting keep him in an even temperature of about 65 or 70 degrees and let him hang where there is no possibility of a draught blowing on him. If not yet in song, hang a half-inch strip of raw, fat, salt pork in the cage and let him pick at it for a week or so."—Except as to avoiding a draught, we do not agree with the above at all.

HOW TO GET RID OF MORNING GLORIES, ETC.—In a late RURAL, L. L. S., Kankakee, Ill., asks how to get rid of morning glories that cover a 10-acre lot, and to this question A. K. R., Olin, Iowa, answers: "Fence the lot off and allow some hogs to run in it. The more the better and the speedier the work. Of course, the hogs must not be rung or have their noses cut. They will root up a square rod two feet deep for a mouthful of the roots of morning glories. The above plan will be found a good riddance for bad rubbish, and it does 't take long. By having a sufficient number of hogs to turn in early in Spring the lot might be entirely cleaned in time for corn planting, if so desired. In answer to the query about a way to ditch without spades: the only ditch I ever made was done with a plow and a common road scraper, the ditch being about three feet deep and five feet wide."

Everywhere.

RURAL SPECIAL REPORTS.

Connecticut.

HUNTINGTON, Fairfield Co., Nov. 14.—The White Elephant had 13 eyes. I planted one eye in a hill in good soil—result, a good heaping peck of fine potatoes. Only one seed of the sorghum came up. The asparagus came up well and is looking fine. The Washington Oats I drilled in good soil; they grew rank and smutted a little. The pinks were beauties. Long may the RURAL prosper! G. D.

Georgia.

CEDAR TOWN, Polk Co., Nov. 15.—Our oldest people in this country never experienced such a drought as we have just passed through. I am satisfied with the Rural Branching Sorghum. I know it can stand a drought pretty well; but to show the severity of the dry weather with us, my sorghum did not mature its seed. I cut the stalks down not long ago for fear of a frost: thought a few heads would mature sufficiently to plant. My Washington Oats smutted badly. I saved about a quart for seed. The White Elephant Potato was washed up in early Spring by high water from a creek in my garden. I neglected to say that the Rural Branching Sorghum was cut and fed to stock repeatedly, except the few stalks left for seed. I have never given it to any kind of stock that refused to eat of it. Corn is worth $1 per bushel, cash. Usually at this season it can be bought at 50 to 60 cents. Dry salt pork, middlings, is worth 11 cents per pound, and everything else to eat is high in proportion. Cotton brings only about 11¼ or 11½ cents, and is not more than half a crop in this part of the country. Success to the RURAL NEW-YORKER! W. J. R.

Iowa.

ROCKFORD, Floyd Co., Nov. 20.—I have looked the RURAL over this last year pretty closely to see where the best things are grown and who grows them. I have been trying a good many varieties of vegetables of late years, as my chief care now is attending to the garden. I see the RURAL'S largest Cuban Queen Watermelon was 27¼ pounds. My neighbors went into watermelon raising considerably and were going to raise 80-pound melons besides getting a prize of $25; but they failed in both. After paying 25 cents for 15 seeds the largest, weighing 21 pounds, was raised by my nearest neighbor. In sending for my seeds last Spring I sent for a five cent package of what was called the Improved Cuban Melon. I planted them and the chickens scratched them all up except seven plants. From these seven I picked 10 melons that weighed from 30 to 34½ pounds; nine that weighed from 25 to 30 pounds, and 12 or 14 that weighed from 18 to 25 pounds; there were two or three quite small that did not get ripe, and every one that tasted them said they were the best melons they had ever tasted. I have given seed to all my neighbors and if you say so I will send you some. They are somewhat like the Cuban Queen but of a darker color. I have also a cucumber that was raised in England about six years ago, that beats anything I ever saw. I have raised it three years and it does well here. It will grow to the length of two feet, and is very handsome and as good as it is handsome. It is just fit for the table when from 12 to 18 inches long. It has scarcely any seeds. I will send you some of these also. [Would thank you for a few seeds.—EDS.] I have one other choice vegetable and that is a pea that was raised here about 12 years ago by accident from McLean's Advancer and a large very tall pea. It is larger than either, and better, and only grows to the hight of the Advancer. It is a very large, wrinkled pea of excellent flavor. I will send you a pint or quart of those if you say so. They are about as early as Advancer, but a great deal larger and better. These are three things that are extra-good and I would like others to have them. There is less trouble to get a dish of these peas than of any kind I ever saw. I have none to sell. A. W. [A small quantity of the peas would suffice for our trial. Please send name and history with them.—EDS.]

Kansas.

SMITH COUNTY, Nov. 22.—I planted the White Elephant Potato on May 10 on bottom land; it was cut to 12 eyes, and they did well all the time, although we had a very droughty Summer, with hot winds. I dug on Sept. 11 a little over a peck of very fine, big tubers. I planted the Branching Sorghum about the middle of June; it came up finely; the hot winds killed all but two hills, that did well

until Sept. 15, when the frost killed the stalks right down. I was very sorry. I sowed the Washington Oats in May, and they did splendidly; they grew about 2½ feet high. I cut them in July and put them into the granary. A trap-door was left open and the pigeons found the opening and destroyed them. I had one Cuban Queen Watermelon that weighed 43 pounds, so I have beaten the Rural Farm. We were very much troubled with chinch and potato bugs, but they couldn't stomach Paris-green and London-purple. Wheat averaged about eight bushels to the acre; it was a little damaged by the chinch bugs. Corn is about one-fourth of a crop. We are getting lots of rain this Fall, making plowing good. We have had three bad years, but hope to do better next. T. H.

WICHITA, Sedgwick Co., Nov. 19.—We had an excessively hot, dry Summer, which was a great drawback to success with the RURAL seeds. The Beauty of Hebron, Early Ohio and Burbank Potatoes have proved the best with me out of 28 different varieties, all treated alike. From the White Elephant we got only about a quart of late tubers, as it was planted very late and the season was unfavorable. The Rural Branching Sorghum was planted in two rows, three feet by one foot apart; almost every seed grew. Part of it was cut when about four feet high and my stock ate it greedily. It grew again six feet high, and what wasn't cut is now about nine feet tall and from 25 to 30 hills have ripened their seed. There were from 15 to 20 stalks from each seed. A. J. P.

Louisiana.

MONROE, Ouachita Parish, Nov. 14.—The drought has thoroughly succumbed to the Fall rains. Cotton has been very nearly all gathered, and will net but little more than half a crop—of a superior quality as compared with that for several years. We have had no killing frost yet, and but three slight frosts to-date. With the rains in October Spring vegetation clothed trees and plants—the heaviest hay crop harvested for years was the result from the grass seeds which had lain dormant during the unprecedented drought of the past Summer. The Bermuda was about the only grass which had not succumbed to the heat and dry weather. We have many fine indigenous grasses, and the Ouachita Valley is specially adapted to stock-raising. I think in the course of time, when capitalists take hold, cotton culture will be abandoned here and the finest stock farming in the world will succeed the dethroned king, who, like most kings, has pretty effectually kept his subjects' noses to the grindstone. I was pleased to read the good word spoken for the Iona Grape in the RURAL of November 12, on page 762. I have grown the Iona to the exclusion, almost, of all others for several years. It has been entirely free from disease of any kind and reasonably productive; the bunches large to very large and compact. Like Mr. P. B. Mead, in his book on grape culture, I place it at the head of the list. In truth, with Iona as the standard, I have found few other American grapes at all fitted for table use. Here, it is hardy, a good bearer, trains well, is handsome and luscious. Nearly all other varieties I have tried fail in several of these qualities, and all, except Iona, in our mild climate and long season, grow too rampantly. In the same issue of the RURAL an inquiry is made about a remedy for cabbage worms. Both the cut-worm and cabbage worm were unusually abundant here last Spring, and I fought them successfully with air-slaked lime profusely scattered over the cabbages and into the heads while the dew was on. The same treatment with the potato bug was successful. F. G.

Michigan.

MASON CO., Nov. 20.—I planted the White Elephant May 25, cut in 17 pieces which were put in nine hills; all grew and yielded 51¼ pounds. The Washington Oats yielded six quarts. The Rural Branching Sorghum grew about four feet high. I cut it once. I think the RURAL seeds have done as well as could be expected on account of the dry weather. R. H.

OWOSSO, Shiawassee Co., Nov. 16.—As a farming community we have no great complaints to make, for, taking everything together, the farmers of this county have received as much money this year for their wheat, oats, cattle and hogs as they did last year, and most of us tillers of the soil are pretty well prepared to maintain and enjoy life, and sit by the fire this Winter and read the RURAL NEW-YORKER. My White Elephant Potatoes turned out splendid. There were 87 of them, some of them very large. The Washington Oats were a failure—more smut than grain. The sorghum failed to grow; but the pinks were beauties. I am well pleased with the investment of $2.06 for the paper and the seeds. Either of them has been worth the money to me, and I shall promptly renew for 1882 and speak urgently to my neighbors of the paper's merits. N. B. A.

New York.

CALEDONIA, Livingston Co., Nov. 18.—My White Elephant Potato was cut to 12 pieces, one eye in a piece—yield, 43 pounds. The Rural Branching Sorghum did not mature. Yield of the Washington Oats 13 pounds; these oats were very free from smut. I have about 175 asparagus plants. The flower seeds were a failure. D. J. C.

Ohio.

BRISTOL, Trumbull Co., Nov. 18.—From my White Elephant Potato I raised 50 tubers that were large enough for eating, 30 smaller ones and a dozen or so of the smallest to throw in for good measure. The whole weighed 19 pounds, the largest weighing three-fourths of a pound. This yield does not come up to many others, but I think it is not so bad for a dry season. I only planted three hills of the Rural Branching Sorghum as I did not have ground suitable for planting more of it. It grew to about six feet in hight, but did not head out in time for the seed to ripen before the frost came. The Washington Oats did not do as well with me as some others have reported, on account of the rust. I will probably get two quarts of good, clean oats. I did not sow the asparagus until quite late, and it was so dry afterwards that the plants did not make a very good growth. I gave part of the dianthus and pink seeds away and planted the rest. Some of the dianthus did not come up, and some, I think, were destroyed after they came up. Part of them blossomed, and they were nice, I can tell you. The season here was pretty dry most of the time and very warm also. We had no rain worth speaking of from August 1 until September 16; since that time it has been wet enough. Wheat and grass came on very well after the rains began—better than for many years. Pastures and meadows that looked as if the grass in them would never start, soon looked as though the Spring time had just come. Railroad and other fires have done a great deal of damage to pastures, fences and woodland, but no buildings were burned. Corn is not much more than half a crop except once in a while some fields turned out first-rate. Wheat and oats were good crops with but few exceptions. Potatoes are a pretty light crop as a general thing, and are selling at $1@1.25 per bushel. We had an excellent crop of grass and splendid weather for making hay. I don't think people around here ever made hay of better quality than they did this year, taking the hay crop all through. Hands were pretty scarce through haying and harvesting and wages were $1.50@2.00 per day. J. S. B.

FAYETTE, Fulton Co., Nov. 18.—Our crops here have been about an average. The drought in May damaged the hay, corn and wheat. The small White Elephant had 10 eyes and was cut into 10 pieces and made 10 hills. We think the yield was good—nearly half a bushel. The Washington Oats were a failure—very smutty and rusty. The asparagus seed did not germinate, nor did the flower seeds come up. E. F.

Pennsylvania.

TITUSVILLE, Crawford Co., Nov. 20.—My White Elephant had a dozen eyes; one was buried in each of a dozen mounds, and altogether they produced 20 pounds of large, nice young Elephants. The asparagus all came up; it is now a foot high. I have four quarts of Washington Oats. I think they are worth more than the price of the RURAL. A. H.

Tennessee.

HUMBOLDT, Gibson Co., Nov. 16,—The White Elephant Potato I cut into eight pieces and planted in eight hills. The yield was 38 tubers, averaging as large as, or larger than, the one planted. Of the Rural Branching Sorghum nearly all the seeds came up. It is all you claim for it. I planted it in thin, clay land. It had no rain to speak of for 80 days. Towards the last it would wilt in the heat of the day, but always came out fresh and green the next morning. I saved seed from two stalks; the others I cut, and it is green where I cut it off and growing to-day. The asparagus has done very well. The flower seeds did well; nearly all of them came up. They commenced to bloom in July and are to-day full of beautiful flowers. R. H. F.

Texas.

DAYTON, Liberty Co., Nov. 14.—Our long dry spell was broken the first week in this month by a perfect deluge. No scarcity of water here now. My flowers and White Elephant gave way to the drought, but I have the Rural Branching and the asparagus all right. One of the magnolias, that took a year to germinate, also succumbed. It has been a delightful Fall for cotton picking. The cotton is about all picked now. G. G.

Vermont.

FACTORY POINT, Bennington Co., Nov. 7.—On May 25 I planted my White Elephant Potato, 19 hills, and in ground that the hogs rooted over a year ago, and only 16 hills came up, from which I harvested 59¾ pounds of tubers. On Sept. 19 I planted my Sorghum too thick, and it grew only six or seven feet high, and the seed did not quite ripen. I harvested about a piut of Washington Oats. I do not think they are as good as the Ennobled Oats sent out a year ago. The flowers were one mass of blossoms, of nearly all colors and combinations. E. W. B.

Wisconsin.

EAGLE, Waukesha Co., Nov. 18.—The season has been very changeable. Crops light except potatoes, of which there has been an extra large yield in this vicinity. The White Elephant fills the bill. I cut mine to single eyes of which there were 12. Planted one eye in a hill on May 16, and dug them September 20—yield, 45 pounds. The Rural Branching Sorghum I planted May 20, one seed in a hill three feet apart each way. I had from 10 to 20 stalks in a hill. I cut off two hills August 20. They afterwards only grew about one foot high. The rest I cut on Nov. 8; the seed did not get ripe. The sorghum is a good fodder plant. In the RURAL of Nov. 5, Z. M., of Darien, Walworth Co., Wis., says: "The Beauty of Hebron excelled all other potatoes with me." With me the Mammoth Pearl yielded twice as much as the Beauty did side by side, with the same cultivation, and Clark's No. 1 was a great deal better than either of them; from three pounds I raised 193 pounds. They were superior in every way to any other sort I raised and I had 13 different kinds. A. M.

HAMPDEN, Columbia Co., Nov. 20.—Frequent rains hinder all farm work. Corn husking nearly done. Hundreds of acres of seed clover not stacked. Frost began Nov. 14 and the ground is now quite hard. Corn is a good crop, but in rather bad order; some of it is sprouted; it was down badly. We have had a good season—showers nearly every week. It is the off year for fruit so we had very few apples; but a good crop of small fruit and fair crops generally. The sorghum seed matured. The asparagus grew two feet high and some of it blossomed. The oats produced eight pounds. The pinks were lovely and much admired. The White Elephant Potato, weighing 1½ ounce, yielded 40 pounds of not very large tubers. They were grown by the side of the Dunmore, and after these were ripe the bugs left them and killed the White Elephant vines, and I think that shortened the crop one-third. Their only fault is that they are late, and eternal vigilance is the price of late potatoes. We can manage the first generation of bugs but the second are too many for us. The Cuthbert Raspberry has produced a good crop for one vine, and there are 20 new sets, some of which are five feet high. It is a fine addition to my small fruit patch. The White Zealand Oats did better than the Washington. From about half as much seed I raised eight pounds of much nicer oats. The Golden Grains Wheat planted in the Spring stooled and made large bunches; three or four ears headed and the rest stood until October and then died, and I had less wheat than I sowed. What I got I have sowed this Fall. G. W. T.

HERSEY, St. Croix Co., Nov. 23.—From the W. E. Potato I made six hills, one piece in each. The soil was good and the potatoes were treated the same as other sorts—hoed but once. The vines grew five feet high, and I got one bushel of tubers from the one small one; several of them weighed 1½ pound apiece. The asparagus has done finely; some plants made a growth of three feet. The pinks were the finest I ever saw—of all colors that a person can name. F. S. H.

STOUGHTON, Dane Co., Nov. 13.—My White Elephant potatoes I cut into 25 pieces and planted them in 25 hills; 24 grew and I got about one-half bushel of very nice tubers. The Cuthbert Raspberries are doing finely; I have about 25 plants now. They bore a few berries the past season, which were very fine. The only trouble I can see will be to stop them from spreading all over the farm. The flower seeds did splendidly; my wife and little girl thought the pinks were worth all the RURAL costs. There were about 20 different kinds. We have rains here about every 24 hours; water very high; farmers very much behind with their work on that account. Grain in stack has been very much hurt by the wet weather. H. M. H.

The Querist.

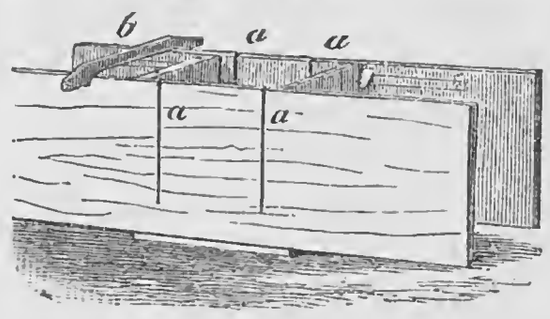
ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

"DOING UP" WOOL; SECOND GROWTH OF CLOVER.

J. S., Ithaca, Mich., asks, 1, what sort of machine is best for "doing up" wool; what part of the fleece should be exposed when it is "done up", and what twine should be used; 2, why does the second growth of clover make all animals that eat of it slobber.

ANS.—A fleece should be laid on a folding table with the outside down, the sides are turned in and the fleece is then rolled up and tied with as little string as possible; the twine used is a thin kind known as wool twine. The fleece is tied around each end of the roll and then lengthwise. A wool table for folding and tying fleeces commonly used in New York State, is made as follows: see Fig. 543. Three boards, one inch thick and 12 inches wide, are used. The center one is cut into three equal pieces and fastened together by butt hinges so that the ends turn up, as shown. The other two are hinged to the center-piece of the first board so that they turn up at each side, as shown. The box is used as follows:—The sides are all let down flat and the table is placed on a bench; two strips of the right length are laid across so as to come up when the sides are closed, as shown at *a. a.* The fleece is laid on the table and the ends of the center piece are turned up; then the sides are turned up and held by a wooden hook, shown at *b.* The fleece is then tied lightly with the strings and the sides are let down, leaving the fleece properly secured. A fleece may easily be tied in 15 seconds, with the help of this table. 2. Second growth of clover very often has some acrid weeds in it, as lobelia and St. John's-wort; and very little clover seed is free from these, so that when clover seed is sown these weeds are sown with it. They blossom and ripen their seeds with the second crop of clover, from which the seed is always taken. If a little lobelia is put in the mouth its effect in causing slobbering or salivation will be readily perceived, No doubt if the clover is examined these weeds will be found in it. Lobelia is easily recognized by its blue-bell-shaped flowers and its ovoid or egg-shaped seed capsules, also by its strong



A WOOL TABLE.—FIG. 543.

taste which is much like that of tobacco. This is Lobelia inflata or the common eyebright. The writer has proved in his own experience the truth of this circumstance and otherwise has never known second growth clover to cause this effect, although it commonly has the reputation of producing slobbering. This plant may also often be picked out of the clover hay and in this case also will produce the same effect. It grows only a few inches in hight. St. John's-wort (Hypericum perforatum) also produces the same effect; it is recognized by its yellows with five petals and a three-horned pistil which of course becomes the seed pod; this has three cells which, with the three diverging styles connected, contain the seed. This plant ripens the seed at the same time as clover, viz., in September and October. It is about 12 to 18 inches in hight.

"NEW-PROCESS" OIL MEAL.

R. C. K., Plempton, Ohio, asks what is meant by "new-process" oil meal.

ANS.—Oil cake is the residue that remains after the oil has been extracted from certain seeds—usually cotton seed, flax or linseed, and rape or colza seed. Flax contains from 30 to 40 per cent. of oil; rape, 35 to 45 per cent., and cotton about 30 per cent. The oil is generally obtained by subjecting the seeds to hydraulic pressure, by which a large proportion of the oil is forced out, while most of the albuminoids, or flesh-forming elements, remain behind The greater the pressure to which it is subjected the less oil and the more relatively of albuminoids will remain. A new method of extracting the oil consists in treating the ground seeds with benzol or bisulphide of carbon which dissolves the oil. Sulphuric acid is also used for the purpose of obtaining a larger quantity of oil from flax seed. The acridity of the acid soon becomes dissipated on exposure to air, and does not in any way injure the health of the animals fed on such "new-process" oil cake, or on the oil-meal made by grinding it. Such meal contains about eight per cent. less oil than the old style sort, and usually sells for about 25 per cent. less, though it is considered equally good for feed, inasmuch as the larger proportion of albuminoids it contains fully makes up for the greater loss of oil. The manufacturers can afford to sell it cheaper, however, for the extra oil they obtain is worth, commercially, eight cents a pound, and the quantity saved by the new process will pay about one-third the price of the flax seed.

NESTS IN A POULTRY-HOUSE.

A Subscriber, address mislaid, asks the best way to make nests in a poultry-house, so that fowls cannot sit on the roof.

ANS.—Nests of the kind desired may be

made as shown in the engraving annexed. The roof is made very sloping so that the fowls cannot stay on it. This is hinged and may be lifted up to remove the eggs. The openings are small so that when a hen is in a nest another cannot get into it. The nests may be made singly or in twos and portable

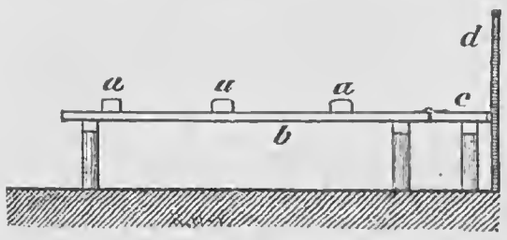


FIG. 544.

so as to be lifted about; or in a range along the house. The roosts are best arranged on a level so that the fowls do not fight to get on the top ones and not more than two feet from the ground, especially when the large heavy fowls are kept. The following plan shows a good arrangement.

The roosts a, a, a, Fig. 544, are fastened to the cross pieces and these rest on posts with strips from one post to another. The frame of roosts is fastened to a back piece c, near the wall d, so that it can be turned up for the floor to be cleaned under it. The roosts should be of 2x4

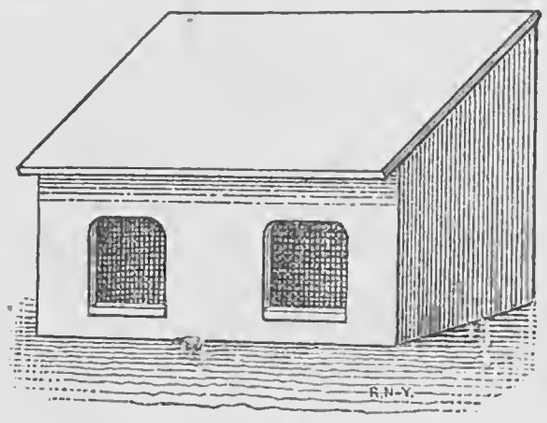

FIG. 545.

scantling with the tops round a little, or half-round poles.

PLAN OF A POULTRY-HOUSE.

A. J. G., West Hawley, N. Y., asks, 1, for a plan of a poultry-house; 2, is Fall as good a time as Spring for setting out fruit trees; 3, how to increase his stock of grapes.

ANS.—1. A good, simple and cheap fowl-house may be made as follows. See Figs 545 and 546. The front is eight feet high, the rear five feet, the roof sloping. The width 10 feet, the length 20 feet, for 50 or 60 fowls, which is enough to keep in one house under any circumstances. The roosts are at the rear and made on a level, and so that they can be turned up to clean the floor under them. The nests are at the front raised a foot from the ground with a bench in front and sloping tops to keep the hens from roosting on them. A few sash are put in at A in front over the nests, facing the south for warmth in the Winter. The floor should be of dry sand and never of boards.

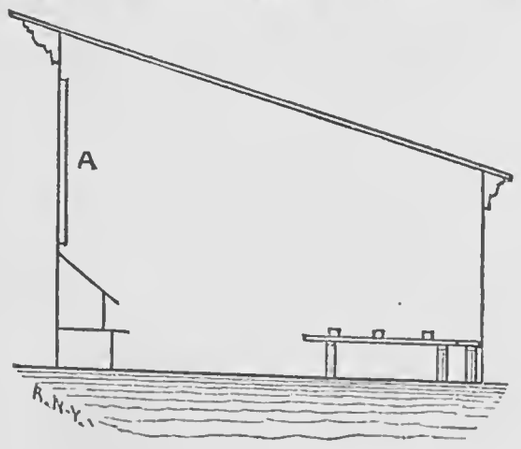

FIG. 546.

There is no place for lice or other vermin to hide in such a house. 2. For your climate we should prefer Spring. 3. By cuttings, as recently explained in the RURAL.

SOME PEACHES.

W. S. B., no address, asks for information as to the merits of the Steadly, Waterloo, Wager and Comet peaches.

ANS.—The Steadly originated with a man of that name in Bluffton, Mo. Tree is productive and healthy. It is a promising kind, of good quality—large, handsome, late. It is a free-stone, and the season is early October. The Waterloo is an early peach raised by Mr. H. Lusk, of Waterloo, N. Y. The tree is a prolific bearer. The fruit is of medium size. Adheres to the pit partially—of very good quality. Ripens late in July. The Wager originated in West Bloomfield, N. Y., with the late Benjamin Wager. Mr. Downing tells us that it is there valued as a market fruit and for canning. The tree is hardy and productive and bears good crops in unfavorable seasons. It is claimed that it often reproduces itself from seed. Fruit medium; skin of a golden yellow; flesh yellow, quite juicy, sweet, slightly vinous—not rich. Season the first of September, or a little later than Crawford's Early. The Comet is of large size—orange with a red cheek. It is said to be of good quality. It ripens in early October. Salway is a late English kind of good quality. See other numbers of the R. N.-Y.

MAKING POTASH.

G. H. T., Plainfield, N. J., having a large quantity of wood ashes asks, 1, whether there is any simple process for converting them into salable potash; 2, also whether ashes made by burning peat will produce potash.

ANS.—1. Potash is made by leaching the ashes and boiling down the lye until the water is evaporated. The solid matter thus produced is heated in the iron pots or kettles in which it has been boiled down until some impurities are burned out of it and a light gray, solid, crystalline cake is left. This is the "pot-ashes" of commerce and is broken into coarse lumps and packed in casks for sale. The ashes are leached in large, square wooden tubs or vats having the sides tapering towards the bottom, and each holding 100 or 200 bushels. The potash kettles are large, heavy cast-iron pots holding from 200 gallons down to 40 or 50 gallons. 2. Peat ashes contain so little potash, and the peat makes such light ash, and there is so little of it, that the potash made from it would not pay expenses. Only the best of hard wood, elm, maple, oak, beech and birch, and no soft wood, as pine or hemlock, is used for making potash.

WEAK EYES FROM MEASLES.

M. B., No address—asks for a remedy for weak eyes, the result of measles.

ANSWER BY T. H. HOSKINS, M. D.

Except in persons of a scrofulous constitution the affection of the eyes in measles does not often require active treatment. The eyes should be guarded from strong light, bathed occasionally with tepid water, and the bowels be kept freely open. If the symptoms are more than commonly severe, leeches may be applied to the temples, and blisters applied behind the ears, or the nape of the neck. Quinine sulphate may be given in small doses with good effect, and a few drops of the following solution should be dropped into the eyes morning and evening: Nitrate of silver, one grain, dissolved in distilled water, one ounce. This solution is better applied with a small camel's-hair brush to the inside of the lids, in severe cases, but it usually requires an experienced hand to do this properly. And, any way, it is better to have a good physician see the case, rather than to seek treatment through the newspapers.

TO REMOVE WARTS FROM A COW'S UDDER.

An old subscriber, Saybrook, Conn., asks what will remove a wart from a cow's udder.

ANS.—Apply caustic potash two or three times a week, and it will soon disappear, or, tie a silk thread tightly around the base so as nearly to cut into it and wholly stop the circulation, and it will come off in a few days. When the wart is broad and flat or crowded by others this may be impracticable, in which case it may be removed by cutting it off and touching the cut with a hot iron to stop the flow of blood; or by applying very strong pyroligneous acid to the wound. Lunar caustic in a strong solution is also recommended. As the operation is painful, only a small number of the warts—if there are many—should be treated at a time.

Miscellaneous.

A Reader, Niagara Co., N. Y., referring to the letters of Messrs. Holmes and Sweetland, asks, 1, can a young man do better in the West than in the East or South; 2, is Northern Dakota superior to Southern Dakota; 3, will sheep-raising and farming in Northwestern Iowa pay as well as sheep-raising in Kansas.

ANSWER BY MESSRS. HOLMES AND SWEETLAND.

1. This depends upon several considerations—the present surroundings of the party: the extent and class of farming proposed; the habits and characteristics of the individual, etc. Of these a person could the better judge individually. 2. Yes; if localities are selected affording shade and shelter and thus adapted to the enterprise. These should be considerations in either case. 3. It is not our mission to make comparisons. Read "Wheat Culture in Minnesota," published in the RURAL NEW-YORKER July 23; "Statements Substantiated," October 1; "Wheat is Queen," October 15; "Facts and Figures," October 29, and decide according to your choice and aim. 4. No. The climate is drier in Northern Dakota, hence less penetrating than the same temperature 300 miles south. 5. Read "Truths from Kansas," published September 10; "Beautiful Iowa," published in June, and "Statements Substantiated," October 1. If we knew the circumstances, tastes, means and habits of any individual we would willingly suggest where, in our judgment, he would be most likely to succeed. The West affords a wonderful variety in its adaptability to every department of agricultural pursuit.

T. G. T., Hornbrook, Pa., sends for name and habits two bulbs of a "lily" brought from South America, and which is known only by the name of "Spirit of Santi." It is white, shaped like a dove, and is reported to be very rare.

ANS.—The bulbs received are those of some Amaryllis, but from the two immature bulbs with leaves attached, before us, we are unable to say to which species they belong. We would require to see the flowers before we could decide the species. When they have finished their year's growth keep them dry for several weeks, then re-pot them into somewhat smaller pots, water sparingly at first, but more freely when there are lots of roots, and abundantly when in full growth; or the bulbs may be planted out in Summer in an open, sheltered spot in the garden, in light, rich soil, and lifted before frost hurts them. The *El Spirito Santo*, or Holy Ghost, or Dove Flower, as it is commonly called, is a large and strong-growing orchid from Panama, botanically known as Peristeria elata, and a vastly different plant from that which our friend has got. In orchid collections in pretentious gardens it is not rare; but as it requires a high temperature, moist atmosphere and green-house room to grow and bloom well, it is not a desirable plant for the dwelling-house or small conservatory.

G. W. K., Harmony Grove, Ga., referring to Tobacco Notes in the RURAL, says it has been the rule there to hang up tobacco by suspending it on sticks close together in the house until it becomes yellow, and then it is hung in the sun until it has dried: but this is too expensive a process, as it has to be housed and a fire has to be built under it in wet weather, and he asks, 1, what is the general plan of drying; 2, whether a tobacco grower can make and sell tobacco to the consumer or manufacturer without getting a license.

ANS.—1, The production of "fancy" or "yellow" tobacco requires artificial heat during the process of curing. The common grades of tobacco, whether seed-leaf or "cutting," rarely need this, and the usual method of curing is simply to hang the plants, when harvested, in curing barns, where they remain undisturbed until dry or cured. 2, A tobacco grower has no right to manufacture tobacco or retail it to consumers without a license.

J. E. S., Wellsville, Va., asks, 1, whether in selecting seed corn from stalks having two or more ears, one only should be taken, or more; 2, do pine needles contain potash, and are they of any value as manure: 3, where can seeds of the Rural Branching Sorghum be obtained.

ANS.—1, If both are about the same size as to ear and kernel and both equally well tipped, we should choose the topmost. If the lower were in essential particulars better than the top ear, we should choose the lower. 2, Pine leaves have a small per cent. of potash, a considerable per cent. of phosphoric acid and lime and a very little magnesia. They are of value as manure, though very slow to rot. We have seen well rotted pine leaves used with good results in vegetable gardens of the South. 3, Leading seedsmen, we presume, will procure seeds, if they can, of this very valuable forage plant.

J. J. W., Jamestown, R. I., asks, 1, whether Fall is a good time to move evergreens; 2, how to take up canna roots; 3, how to winter carnations—is it best to pot them or cover them in the garden.

ANS.—1. The Fall is the worst time, the Spring the best time to transplant all kinds of evergreens. 2. Canna roots should be taken up after the first frosts have harmed the leaves. The earth should be washed off, the roots dried in the sun and then placed in sand for the Winter. This is the best method of preserving them we know of. Keep the box or barrel in which they are stored in a temperture as near 40 degrees as may be. 3. You can do either. They should stand the Winter if covered *loosely* with straw or hay.

A. S. M., Peterborough, Canada, asks the name of some good work on gardening and small fruit culture, and says he did not receive the RURAL's last Free Seed Distribution.

ANS.—Peter Henderson's Gardening for Profit is as good as any we know of. But it does not treat of small fruits. Really for this, there is no better work than a year's file of the RURAL NEW-YORKER, which gives special attention to horticulture in all its parts. Roe's book on small fruits and their culture is an excellent guide. The seed distribution was this year and will be next, sent to all of our subscribers who apply, inclosing two three-cent stamps.

L. R., Paris, N. Y., asks, 1, in which location will the Laurel-leaved Willow thrive best—a wet or a dry one; 2, where should the Hardy Catalpa (C. speciosa) be planted.

ANS.—1. We have the Laurel-leaved Willow (Salix pentandra ?) growing within three feet of the house (high ground). It grows luxuriantly. We have one on a sandy hill, where it also thrives. We have it on our lake banks. Here it grows rapidly, but the bank is raised several feet above the surface of the water. In wet places it winter-kills. 2. The Catalpa speciosa seems to thrive almost anywhere. We have it in sand and clay. Probably it would not like a wet position.

R. M., York, Ohio, asks how much corn can be safely fed to sheep during the Winter?

ANS.—Two to three bushels per head form the common ration, where corn is depended on, though sometimes as high as six or seven bushels are fed without injury. The best results will follow where grain is fed as soon as the early frosts damage the pastures, gradually increasing the quantity as the weather becomes colder and the pastures scantier. Then if the flock is regularly and liberally supplied with hay, good straw or corn fodder and plentiful water, any amount that is consumed with seeming relish may be fed.

Incog., Sharon Centre, N. Y., asks, 1, whether slate roofs are not cheaper than shingles; 2, what are the best slates and how much do they cost.

ANS.—We can answer that, if well laid, they are lasting and cheaper than shingles. But a poorly laid slate roof is a perpetual torment and expense. 2, The Chapman slate is the best in market and costs about $11 per 10 feet square. This is not a smoothly-finished slate, but it will last long. Vermont slate is cheaper, but the quality is not as good.

R. M., Albany, N. Y., asks for a remedy for a leaking teat in his three-year-old Jersey cow.

ANS.—Place a soft India rubber band around the base of the leaking teat, and in order to prevent it from sinking too deeply as well as to facilitate its removal at the time of milking, wrap around the upper part of the teat a layer of linen or thin, soft leather for the band to rest on. At milking time the band may be easily removed.

J. C. McC., Tidioute, Pa., asks where can he obtain second-hand veterinary books.

ANS.—At any large second-hand book store in the large cities or through local book dealers, now and then, in the smaller places. Leggatt Brothers, Chambers Street, this city, are the largest dealers in that sort of books here, and could doubtless supply any work either right away from their stock or after a time by hunting it up.

E. H. N., Charlevoix, Mich., asks whether the Wagener apple tree is short-lived; and, if so, is it because it is an early bearer.

ANS.—The Wagener is an early bearer, but we were not aware it was specially short-lived. As a law of nature, however, it is not unreasonable to suppose that early maturity and early decay go together.

L. H., Atlantic, N. J., asks for a remedy for stringhalt in a mare.

ANS.—There is no remedy for stringhalt. No sort of treatment is of any avail. Horses so affected are able to do all sorts of work; but the affection is considered a form of unsoundness.

H. M. W., Georgetown, Texas, asks where can he get some White Elephant Potatoes and R. B. Sorghum seed.

ANS.—The White Elephant Potato is for sale by leading seedsmen. The R. B. S. will, no doubt, be offered in leading Spring catalogues.

T. J., Lyle, Minn., asks how much postage shall he send for a named selection of our next free seed distribution.

ANS.—We divide the postage with our subscribers, they paying us six cents. We send the entire list to all, as it would be impracticable to divide it.

J. M. Allen, Urbana, Neosho Co., Kansas, asks who has Oxfordshire Down Sheep for sale. From a late description of them in the RURAL he infers that they are just the sort he wants.

G. W. R., Dayton, Ark., asks what is the best pasture grass for that southern latitude.

ANS.—Bermuda Grass, if not objected to. Probably Kentucky Blue Grass next.

J. H., Lynchburg, Va., and others, ask where can the Marlboro Seedling Raspberry be bought.

ANS.—It is not yet for sale.

F. S. H., Hersey, Wis., asks whether the RURAL pinks will live all Winter and come up in the Spring.

ANS.—Yes, if lightly covered with straw or leaves.

M. H., Stoughton, Ill., asks where can he get the Early Ohio Potato?

ANS.—From any seedsman.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, NOV. 26, 1881.

AUSTRALIAN MEAT.

After all that has been said and done about this, it does not seem likely to come into any great competition in England with American fresh meat. In order to transport it fresh from Australia to so distant a port as any part of Europe, the meat must be frozen. On arrival, as soon as it is taken from the cold compartments of the vessel and exposed to the air, it almost instantly begins to lose taste, and soon becomes unsalable, the butchers declining to receive and undertake to keep it for their customers.

The methods of keeping meat from Australia, and that frozen in Russia and other countries of a high Northern latitude are entirely different. In the latter there is no thaw during Winter, but one continued, steady freeze. As soon as it becomes sufficiently cold, animals of all kinds are slaughtered, the carcasses dressed and piled up in heaps in the open air; and the beef, mutton, pork, poultry or wild game is taken from these heaps as wanted, care being used to consume all before a thaw sets in, which does not come till the last of March. In this way the meat is kept perfectly fresh, juicy and sweet. In fact it is improved by the freezing, becoming a little more tender and savory from the action of the frost on it. Thus it will be seen that our American breeders of domestic animals have little to fear from the competition of Australia or other countries very distant from Europe.

ENGLISH HAY AND GRAIN DRYING MACHINE.

Mr. Gibbs has improved this somewhat since using it last year, and has been more successful than ever with its performance. During wet weather he cut and cured 30 tons of hay in 23 hours, at a cost of 13s. 6d. per ton (about $3). He afterwards dried the product of 33 acres at a less relative cost. He has dried seven acres of a heavy crop of clover in nine hours, and so on, with regard to other crops of hay, in a longer or shorter time as the case might be, and at a greater or less expense according to the downfall of the rain, as it fell heavier or lighter and for a longer or shorter time.

In drying wheat and other grain crops he has been equally successful. We wish our mechanics would turn their attention to getting up a similar machine; for, although our climate is not nearly so rainy a one as that of England, still we have so much rain occasionally in June, July and August as to badly damage the hay, rye, wheat, barley and oats. The cost of drying here by machinery could not be as great as it usually is in England, because, even in quite rainy months, we are favored more or less by a bright sun. Our mechanics have been very successful in getting up mowing and reaping machines, hay spreaders also; let them now try their hands at hay and grain driers.

Kiln-drying has also been successful, the wheat being thrashed when the straw was quite wet, and the grain then put on to the kiln. One writer says he has a kiln 16 1-2 feet square, on which he can dry 45 bushels at a time, and the grain dried well in four hours. Then he put this with a bulk of one-and-a-half as much more of undried wheat, let it lie 48 hours in a heap, then turned it, and after 48 hours longer put it through the *blower* (fan mill we suppose he means), and it made a dry marketable quality, which no miller could have told was not all dried well in the sun.

INSANITY OR MORAL PERVERSITY.

The alarming increase of crime which is attributed to insanity, is a matter deserving the serious consideration of sensible people. The trial of the perverted creature who assassinated our late President, has brought this subject forward prominently as a question for public discussion and earnest private thought. What is insanity? The word itself means unhealthfulness or disease, and is by common consent applied to the mental system. An insane person is one whose mind is diseased. This view of the case leaves open a wide distinction of degree, for the disease may be temporary and mild, or it may be serious, permanent and incurable. Between these two points there may be a great many gradations, as in fact there are. But the most serious consideration is, how is insanity produced and is there any point in this disease which approaches very closely to, or may be considered as, moral perversity due to ungoverned disposition, or an actually cultivated and fostered malignity of purpose? Self-will, a natural disposition to ignore the rights of other persons, obstinacy, vanity, cruelty and an utter disregard of the rights or comforts of our fellow creatures, may all, by continuous cultivation and practice, soon produce those conditions in the mind of a man which will possess and exhibit all the symptoms of mental disease.

It is a fearful thought, but a most pertinent one, how much of this mischief has been done by the want of repression and training and the proper subjection of the minds of children to a due regard to the rights of others and the rigid control of the passions. The ungovernable fury of the manslayer; the insatiable desire for the possession of money that it may be squandered in the most senseless and stupid manner, may very easily be produced in a mind all unbalanced and perverted by a continued and unchecked practice of anger and malice in the one, or extravagant greediness and self-indulgence in the other. Without pursuing the question further we submit it as one deserving the most careful and earnest thought of those who are rearing children and young persons, and whose first care of their inestimable charges should be to encourage in them, by every possible means, by education, training and example, a sound mind in a sound body; and not in the care for the latter to neglect the far greater interests of the former.

OUR IMMIGRANTS.

We make no apology for a somewhat frequent reference to the large number of immigrants daily arriving at this port. The question which treats of the reception and care of nearly half a million people, with their social, religious and national prejudices, their habits of indolence or of industry, their political beliefs or disbeliefs, is one that cannot be slighted; its importance demands for it a thoughtful consideration. It is a problem affecting not this city or State only, but the whole country, especially the West, whither most of the immigrants finally go. In the first place the appropriations to the Commission of Emigration at this port are not sufficient. When but two or three hundred immigrants came here annually the sum of $500,000 was each year appropriated for their reception and care, and it was none too large, but now when over 400,000 annually arrive, as was the case last year, the sum of $150,000 is deemed sufficient, and from this must be deducted $8,000 a year for rent, which, with other expenses, brings the actual annual working capital down to $130,000.

Again, no Commission of Emigration made up as this one is of business men with other duties to attend to, can faithfully perform the duties devolving upon them. They need to give their whole time and attention to the work. Two bankers, one publisher, one capitalist, one dealer in hats and one in the insurance business, together with the Mayor and an agent, each, from two emigrant societies, make up this Board. Even with the necessary clerks the work is too great, and added to this the hospital on Ward's Island, with its 600 patients, is under their supervision. This latter difficulty may be remedied by increasing the number on the Commission, and by placing men there who can devote their whole time to the work, thus enhancing its efficiency.

As an aid to the solution of the "deficiency" problem, the one dollar tax on each immigrant arriving should be legalized. If it is not in the power of the State Legislature to do this, inasmuch as such action is at enmity with the Constitution, then let the Federal Government authorize such a tax. About seven-tenths of all immigrants to this country land at this port; this State, by its appropriations, assists these people to homes, mostly in the West; it obtains passage for them thither at reduced rates; it cares for them at the Ward's Island Hospital, if they arrive sick; any time within a year it will give the discouraged and home-sick a free passage outward again—and all this is done with the $150,000. Inasmuch as this State is not by any means the one most benefited by the money and labor of the immigrants, simple justice demands that such a tax as the one suggested, be authorized, thus removing from New York a large expense which she should not bear alone.

REPEAL OF THE FRENCH EMBARGO ON AMERICAN PORK.

The late change of ministry in France, by which Gambetta has been made premier, is likely to have a beneficial effect on exports of American hog products from this country and consequently on the prices of our live hog crop. It will be remembered that on February 18, last, an order was issued by the Government of France prohibiting the importation of American hog products within her borders on account of the grossly exaggerated reports of the prevalence of hog disease here. Later on it was demonstrated not only that these were false, but also that as lard is boiled in the process of manufacture and impurities are neutralized in the refining, there could be no risk of disease in the consumption of that article, even if there possibly might be from the eating of pork. The embargo was then modified so as to admit lard while still excluding other hog products. Even with this modification, however, our hog industries have suffered greatly from the action of France, the more so as several other European nations have followed her bad example. It was mainly owing to this that our exports of hog products were 280,000,000 pounds less between March 1 and November 1, in 1881, than during the corresponding period in 1880, although from the previous November 1 to March 1, there has been an increase of 110,000,000 pounds, so that there was a fair prospect that our exports of hog products this year would have exceeded those in any previous twelvemonth, had not France and the other European countries forbidden their importation.

Immediately on the issue of the prohibitory decree in France an influential movement for its abolition was set on foot by a group of French scientists, who showed the senseless nature of the scare about the exceptional prevalence of trichinæ in American pork. The Bordeaux Syndicate of Commerce also protested vehemently against it; and so did the large body of free-traders whose principal mouthpiece, M. Leon Choteau, has been persistently agitating for the repeal of the decree. The vigorous action of our own Government in relation to the embargo, and the agitation of the subject of trichinosis have led to a great deal of research. Hence it has been proved that the distribution of trichina spiralis is well-nigh universal. The recent report of M. Zundel, of the Society of Sciences, Agriculture and Art, of Alsace, shows that he found the proportion of affected hogs in Prussia as 1 in 2,500, while in some parts of Germany it was as high as in 1 in 770; in Southern Sweden 1 in 63; and in the United States 1 in 50. The pest was found not to be confined to hogs alone, but to infest every animal examined, wild or domesticated, except the horse; and it is still doubtful whether he is wholly exempt from it.

With the fact fully established that the dissemination of these parasites is practically universal, and that they infest not hogs alone, but nearly all other food animals to a greater or less extent, the idea of averting trichinosis by restricting trade in meat appears one of the greatest absurdities to which crude legislation, fostered by prejudiced clamor and imperfect scientific inquiry, has ever given rise. Accordingly the Gambetta ministry, which is much more strongly inclined to free trade than its predecessor, has decided to abolish the obnoxious embargo on American hog products; and this morning's cablegram informs us that freedom of importation of salt meats will be allowed after the speedy annullment of M. Tirard's decree restricting the importations. The repeal of the prohibition will doubtless give an extra impetus to our export trade and considerably enhance even the present high price of hogs by enlarging the market for them. Other European countries will probably soon follow the present example of France as they did her former one, although to-day's cable informs us that Roumania has just renewed for a year the prohibition of importations of pork from the United States and several European countries.

We have already heard of several large contracts for hams, shoulders, sides, etc., made during the past week for export to France in expectation of the raising of the embargo definitely announced to-day.

BREVITIES.

The Illinois Industrial University offers to those who cannot give longer time to agricultural study in schools four daily courses of lectures during its Winter term—eleven weeks from Jan. 4, 1882. The subjects are: General Farm Management; Animal Husbandry; Diseases of Animals, and Elements of Horticulture. The University library and museum will be open to those in attendance. The annual Agricultural Institute will be held the last week in January.

One more step has been taken toward securing a site for the New York Agricultural Experiment station. On November 23, the committee consisting of P. Barry of Rochester, N. M. Curtis of Ogdensburg, J. S. Woodward of Lockport, and James McCann of Elmira, commenced a tour through the State for the purpose of visiting farms offered for a site. The farms first examined were in the vicinity of Utica. They were accompanied by several prominent gentlemen interested in the movement.

The latest crop reports from the Agricultural Department give the average yield of wheat per acre for this year as 10⅝ bushels, against 13 1-10 last year. The severe Winter, the drought and insects caused a large falling off in the crop in the West, but the quality is generally reported good. Corn has yielded, on an average, 20⅝ bushels per acre, a falling off of about 25 per cent from last year's yield. The quality is not up to the average. The drought seriously affected the cotton crop in the South and the total yield will be a considerably less than last year. In Louisiana the decrease is about 33 per cent.; in Texas 40; in Arkansas 60; in Florida 15; in Tennessee 42; while in South Carolina, Mississippi and Georgia the crop will be about the same as last year.

During the past week we have received from all parts of the country a very large amount of information on the driven well question in answer to our published request and to a multitude of private letters of inquiry. Hitherto we have not had time to read, compare and systematize this mass of often discordant information: but from what we have already learnt, we feel pretty confident that if the case is skillfully presented, Green's patent will be declared invalid, if not by the United States Circuit Courts, at any rate by the United States Supreme Court. During the present agitation a very large amount of new evidence as to the antiquity of the method of well-making covered by that patent, has been collected, and it seems to us that the patent can be successfully assailed on another point also. Next week we shall begin to lay our share of the evidence in detail before our readers.

A committee appointed by the National Grange, which has lately been in session in Washington, called upon Commissioner Loring this day week to urge him to use his best efforts to elevate the Department of Agriculture to a higher rank, and to convey the protest of the National Grange against including in that Department any interest except that which it represents—agriculture. On both the points presented the Commissioner had views different from those pressed by the Committee. So far as he was concerned he could not urge any action looking towards making his a cabinet office. He advocated the enlargement of his Department so as to include those interests which are intimately and to a great extent inseparably allied to agriculture. There should be a bureau of manufacture where producers could find such information as would be for their best interests in the production of cotton, wool, etc. A bureau of mining should also be established. As to railroads, he thought something might be done by which the whole country might be benefited in the way of equalization of fares and transportation. All these, together with the present Agricultural Department, would be known as the Department of Industries, with which the Land Office also should be connected. His present office, he believes, has not yet risen to the dignity of a full Department. Too dignified and impartial to push any single interest, he intends to advocate what he thinks for the best interests of all.

Sugar Beets.—Some of the local papers in York, Pa., are a trifle too enthusiastic in their predictions of the advantages of starting a beet sugar factory at that lively little town. Neither 30 tons of beets nor $100 net profit per acre can be realized from the industry. There is some talk of organizing a sugar beet factory in Orange Co., N. Y., and meanwhile a number of farmers have planted a considerable amount of sugar beets to feed to stock. In Oswego Co., N. Y., the advisability of organizing a beet sugar factory is also being discussed, and a number of acres have been planted to beets which are intended for cattle feed. For this purpose they are valued at $5 per ton. The crop is reported good in spite of cold weather. The Standard Sugar Refining Company of Alverado, Cal., reports that the average yield of sugar beets in that State will this year be at least 15 tons per acre, of excellent quality. The company began work on August 27, and has averaged 80 tons a day. The beet sugar factory at Berthelr, Canada, is ready for work. It will work by "diffusion," using 300 tons of beets every 24 hours—double the amount used by any other Canadian factory. Fifty tons of coal will be used every 24 hours to produce steam; 3½ tons of coke for the lime kiln, and 2½ tons of limestone for the production of carbonic acid. The daily expenses are expected to be $200. The entire factory at Franklin, Mass., has been sold for $32,300. The Delaware Beet Sugar Company's crop will not average over nine tons per acre owing to dry weather and poor seed. It offers $3.50 per ton to farmers; but these are holding out for $5. The company expects to manufacture three or four times as much sugar this year as last. This and the California factory are the only two surviving in the United States. The Mohawk Valley Beet Sugar Company is still confining its efforts to talk—perhaps the safest thing.

Miscellaneous.

MOORHEAD, MINN.

Its Agricultural Surroundings, Commercial Interests and Railway Connections.

MESSRS. HOLMES AND SWEETLAND.

[Special Correspondents of the RURAL NEW-YORKER.]

MOORHEAD is especially happy in its locality and site. It is the county seat of Clay County, Minnesota, and here is the junction of those two great railroads, the St. Paul, Minneapolis and Manitoba and the Northern Pacific, ere they cross the Red River of the North. In several letters already written we have discussed the merits and given statistical information regarding the productiveness of this valley; hence we will only say of the country tributary to Moorhead, that it partakes of all the many characteristics in the general excellence and fertility of its soil. The average yield of wheat this year will doubtless exceeed 20 bushels to the acre. We learn from Messrs. Comstock & White that property in Clay Co. has appreciated in value from 30 to 35 per cent. the past year, being held now at from $3.50 to $10 per acre for wild land; improved farms bring from $3 to $5 additional.

Besides the railroads mentioned above, grading has been commenced upon the Moorhead & Northern R. R., which will be pushed to rapid completion. The Moorhead, Breckenridge and McAuleyville R. R. has been surveyed and will be soon built. Having also river connections by two lines with the north, thus giving outlets in every direction, this city bids fair to be an important railway center and receiving and distributing point.

Its site is high and dry, well drained (three "coolies" or natural drains through it) while the sewerage system now being put in is thorough and complete. An excellent feature we noticed is an organization called "The Moorhead Loan and Building Association," to aid persons of small means to acquire property and obtain a fair start Edw. E. Moore, cashier of the Merchants' Bank, is secretary. Such institutions should be promoted and encouraged in every growing city. The assessed value of property in Moorhead (on the basis of about one-third) is $501,000, while the value of permanent improvements for 1881 exceeds $400,000, against $300,000 for 1880. There is no city indebtedness. Business lots can be purchased for from $500 to $1,500 on the main streets, while residence lots bring $25 to $100.

Moorhead's population last census was 1,800; it is now estimated at between 2,500 and 3,000. There are Presbyterian, Episcopal, Methodist, Catholic, Lutheran and Baptist church organizations, all well housed except the last named, which expects to build soon. The valuation of church property is $17,000. The school building cost $25,000 and is considered the finest in this portion of the State, having high and graded school departments. The high school receives aid from the State by appropriation.

The Moorhead Argonaut, weekly, expects very soon to establish a daily. The social life is on a par with the business activity, the several civic societies having prosperous lodges. Like most progressive cities, Moorhead has complete telephone connections, with Fargo; and the street railway company recently organized intend to connect with their sister city, for which purpose and many others the necessities of a free bridge are keenly felt, and arrangements are perfected for an excellent one to be built of iron. The water-works are owned and controlled by the city; 7,000 feet of mains have been laid this season. The pumping is being done at present by the Moorhead Manufacturing Co. There are two banks (one recently opened), with an aggregate capital of $160,000; while the banking and exchange business of the one for the past year has been between five and six millions. During 1880 the wheat marketed in Moorhead was 700,000 bushels, and the elevators have received at this time double the quantity and 5,000 bushels more than last year. The grain storage capacity is: elevator, 120,000 bushels; warehouses, 30,000 bushels; St. Paul, Minneapolis and Manitoba Railway elevator (to be built this Fall), 150,000 bushels, and elevator for mill, 65,000 bushels; total, 365,000 bushels. At the time of our visit grain prices were: wheat, $1.33; oats, 60c.; flax, $1.05. The commerce of the city averaged, from statements of several leading citizens for the past year, over $5,000,000. Among recent improvements one which is of the greatest importance to Moorhead, as well as to the entire Northwest, is the building, by the Mayor, H. A. Bruns, of the Grand Pacific Hotel, opened to the public November 15. It is Athenian in architecture, has 120 rooms and 18 bath-rooms with hot and cold water and the same number of water closets. It is lighted with gas, except the office and dining hall, which will have electric lights. It has elevators, pneumatic calls, steam heating, steam laundry, etc., being complete in every detail. The waiting rooms, ticket and baggage rooms and land department of the Red River Valley division of the St. Paul, Minneapolis and Manitoba Railway will be in the building. These offices are simply complete in every detail, large, well ventilated and handsomely finished. Their perfect arrangement reflects great credit upon their designer, and the road certainly has just reason to be proud of its quarters in Moorhead. The cost of the building, with furniture, has been $166,000. Having also another excellent and well-kept hotel, the Jay Cooke House, Moorhead's reputation for caring for the traveling public is assured. The Mayor also built, in 1880, a neat and handsome opera house, seating 500, with all accessories of stage, etc., costing $16,000.

Briefly summing up Moorhead's manufacturing establishments and needs, we will close. The Moorhead Manufacturing Company have a roller flouring mill of 150 barrels daily capacity running night and day. There are a large brewery and four brick and tile companies, which burned 8,000,000 brick this year, and a steam saw-mill, capacity about 40,000 feet of lumber per day, is to be built at once by experienced parties. All steamboats of the Red, Saskatchewan, and Assineboine Rivers (with a few exceptions) were built here. There seem to be openings for manufacturers of linseed oil, tow, straw paper, and, perhaps, agricultural implements, and we are told of vacant niches for furniture, ladies' and gents' furnishing goods, and a tailor.

With this brief summary of the interesting points of Moorhead, we will once again visit "The Park Region," and write of its interests as we journey.

A VISIT TO A COUPLE OF NEW YORK SLAUGHTER HOUSES.

AT the foot of West Fortieth Street, N. Y. is the great West Side abattoir or slaughter-house. It is 425 feet in length and about 200 feet wide, and is of easy access to the river. This is the largest establishment of the kind in the city and the average number of beeves there killed and dressed for market is about 2,200 per week or something over 114,000 per year. The average weight of the cattle arriving at the abattoir is said to be about 1,200 pounds, though judging from those we saw in the stalls, we should think that figure a trifle too large.

The manner of killing the cattle and dressing them is similar to that pursued in all establishments of this kind. There are at this abattoir 12 pens or stalls into each of which, say five cattle are driven at a time, or just enough to stand without crowding. Corresponding with each of these pens and connected with them by a wide door-way, is the place where the beeves are dressed. When one of the animals is wanted for slaughter, a man steps into the stall, places a noose about the hind leg of the beast, attaches to this the pulley-rope and tackle and in an instant the animal is hanging by its hind leg, with its head just touching the floor. In another instant the "sticker" has drawn his long knife across the throat and the black blood pours out in streams. Three workmen, a "dresser" and two assistants, then lower the carcass, flay it and cut it up, and in less than 15 minutes from the time the struggling animal leaves the stall the warm, quivering flesh is dressed and rinsed and hangs in the shambles ready for market. There are, as we have said, a "dresser" and two assistants to each "critter," who are hired by the week. In some abattoirs the "sticker" gets 15 cents per head and the "dressers" about 60 cents.

While watching this interesting process o transforming live animals into beef, we noticed that a different mode of killing was practiced upon one victim. He was struck between the horns with an axe and a small aperture was made in the throat through which the dark blood flowed into a pail set beneath. On asking a young man who stood by, why this animal was made an exception to the rule, and his blood collected so carefully in a pail, he said "That's for me to make blood puddin' of." It seems that he is an *attache* of some neighboring German restaurant where it is said, "blood-puddin'" is considered a delicacy. When the day's butchering is done the floors are washed, and everything is made ready for a repetition of the work on the morrow.

THE PROCESS OF KILLING AND DRESSING HOGS

is still more interesting and in order to see this most satisfactorily, we crossed the street to the Western Stock Yards, the name by which these premises are known. The "porkers" are introduced to their fate in a manner quite similar to that practiced in the cattle department. They are driven from the pens outside up an inclined pathway to a platform elevated several feet above the main floor of the building. Here each hog is caught up by a hind leg and suspended, head downward, upon a horizontal iron rod along which it is passed until it comes before the "sticker" who is, indeed, a formidable-looking being, armed with a long, sharp knife, while his hands and leather apron are covered with the blood of his victims. By him the hogs are "stuck" in the throat, and they are then run along the horizontal rod until they arrive just over a chute into which they drop, one at a time, and slide down into the scalding vat in the basement. Here they remain until the workman in charge (who, by the way, has been in the business 21 years) pronounces the "scald" sufficient, then by an ingenious contrivance they are lifted out one by one, and thrown upon an adjoining table. Two men then attach a hook to the lower jaw of the hog and then to an endless chain which conveys the hog upward through a large cylinder provided within with scrapers which remove nearly all the hair as the hog passes up.

Arriving at the top it passes over another cylinder, is unhooked from the chain and falls upon slightly inclined tables, where stand eight men, four on either side, who complete the scraping and external dressing. Two men then insert the gambrel in the hind legs, by which the hog is suspended to a circular iron rod, and passes first to the "dresser" who, as we timed him by the watch, removes the intestines at the rate of four hogs per minute. He has acquired a high degree of skill in 16 years' continuous experience. The now nearly-dressed hog passes around to another who rinses the pork (for such we must now term it) and then to another who transfers it to the shambles, where it cools and is marketed.

"How long does it take for a porker to 'pass through the mill'?" we inquired of a workman. "Can't say exactly," he replied, "but with a full force we can get 200 of 'em through in an hour;" but a non-interested party informed us that 150 per hour was a good average, and so we thought.

We were also informed by the keeper of the yards that during the war a million and a half hogs annually passed through this slaughter-house to market, but owing to the fact that similar establishments are in operation in almost all the larger Western cities, much less than half that number are now slaughtered here.

Half Hardy Trees and Shrubs.

I think, after all, it is difficult to decide as to these, for the question is whether if any of our natives which are among the most hardy roses, were placed in the same circumstances as those which are considered half hardy, they would not be killed in the Winter. Nothing is more hardy than the Red Cedar, and yet every three or four years, more or less of these of various sizes are killed on my grounds, no matter how placed, whether standing singly, in groups, or, in a crowded forest.

The Japan Akebia (quinata) is reported as hardy in the Rural Grounds, but planted in mine about a degee and a half farther South, in a place exposed to the north wind, it invariably died every Winter whether mild or severe. I then planted it on the south side of my house basement, protected by a brick wall on the west. It grew well there for eight years, thickly covering the first-story veranda till the past Winter, when it was killed, the roots as well as the vines. A.

CATALOGUES, ETC.

FARMING FOR BOYS. What They have Done, and what Others may do in the Cultivation of Farm and Garden. How to Begin, how to Proceed, and what to Aim at. By the author of Ten Acres Enough. Illustrated. Boston: D. Lothrop & Co. Price $1.25. This excellent work, from the pen of the author of Ten Acres Enough, will be warmly welcomed especially by the young people who live in the country, and it should be the aim of parents to put some such book as this in the hands of their children. The author shows the advantages of farm life, its healthfulness, its freedom from temptation, and the sure reward it brings to intelligently directed industry. The book is in the form of a story, and will be read by those for whom it is intended with delight and profit.

ANNUAL CATALOGUE of the Columbia Veterinary College and School of Comparative Medicine, 217 East Thirty-Fourth Street, New York. This college is connected with the University of the State of New York, and this catalogue contains the names of 28 graduates and 41 of the matriculated class of 1880—1881. The faculty embraces the names of well-known veterinarians, and the course of study seems full. Alexander Hadden, M.D. is president, and applications for information should be made to him.

PROGRAMME of Eleventh Annual Meeting of the Michigan Horticultural Society, to be held in South Haven, Dec. 5, 6, 7, next.

Literary.

GREEN APPLES.

PULL down the bough, Bob! Isn't this fun?
Now give it a shake—there goes one!
Now put your thumb up to the other and see
If it isn't as mellow as mellow can be.
I know by the stripe
It must be ripe!
That's one apiece for you and me.

Green, are they? Well, no matter for that,
Sit down on the grass, and we'll have a chat,
And I'll tell you what old Parson Bute
Said, last Sunday, of unripe fruit;
"Life," says he,
"Is a beautiful tree,
Heavily laden with beautiful fruit.

"For youth there's love, just streaked with red,
And great joys hanging right over his head;
Happiness, honor and great estate,
For those who patient work and wait;
Blessings," said he,
"Of every degree,
Ripening early, and ripening late.

"Take them in season, pluck and ate,
And the fruit is wholesome, the fruit is sweet;
But, oh, my friends!" Here he gave a rap
On his desk, like a regular thunder-clap,
And made such a bang,
Old Deacon Lang
Woke up out of his Sunday nap.

"Green fruit," he said, "God would not bless;
But half life's sorrows and bitterness,
Half the evil, ache and crime,
Came from tasting before their time,
The fruits Heaven sent,"
Then on he went
To his fourthly and fifthly—wasn't it prime?

But, I say, Bob, we fellows don't care
So much for a mouthful of apple or pear;
But what we like is the fun of the thing,
When the fresh winds blow, and the hang birds bring
Home grubs and sing
To their young ones, a swing
In their basket nest, tied up by its string.

Like apples in various ways;
They're first-rate roasted before the blaze
Of a winter's fire; and, oh, my eyes,
Aren't they nice, though made into pies!
I scarce ever saw
One, cooked or raw,
That wasn't good for a boy of my size.

But shake your fruit from the orchard tree,
To the tune of the brook and the hum of the bee
And the chipmunks chirping every minute,
And the clear, sweet note of the gay little linnet,
And the grass and the flowers,
And the long Summer hours,
And the flavor of sun and breeze are in it.

But this is a hard one! Why didn't we
Leave them another week on the tree!
Is yours as bitter? Give us a bite,
The pulp is tough and the seeds are white,
And the taste of it puckers
My mouth like a sucker's!
I vow, I believe the old parson was right!

THORNS AND ROSES.

CHAPTER IX.

(Continued from page 803.)

My new home! I looked around at the old home and its garden—the home of my child hood—and a pang shot though my heart at the idea of leaving it even with him!

"Nevil, suppose you could not like me when I left home?"

"My dearest girl, some foolish fear seems to haunt you, but I can understand your feelings. Only, what am I to do without you? If you knew how lonely I am, you would pity me. At home, I fancy how bright it would be if you were with me.

"When will you come to me?"

"When you please. Nevil," I said; "I do not fear the future with you!"

We walked on silently. It was but one evening among the many happy evenings strung like golden beads on the rosary of memory.

When the guests were gone, my cousin announced with a yawn that she must return home.

"You are rather interesting at first, Kate, but you are getting tedious, and even Nevil has ceased to amuse me.

"Papa, too, will think I am going to live here altogether. I shall leave my interesting Edgar to your care, Kate. Like everyone else, he is boring and prosy."

I read Edgar Dana's play the following morning, and was not a little surprised by its beauty. The heroine was an idealized Edith, the hero himself, of course; but it was well written, and not wanting in dramatic force and power, though rather a poem than a play, and I certainly did not think it suited for the stage of present days. After reading I had little confidence in my own judgment, and feared either to praise or disparage.

CHAPTER X.

Since the day of Edith's departure I had seen nothing of Edgar Dana, and this surprised me not a little, as I thought he would have been eager to hear about his play; but I had not to wonder very long. He called one afternoon—an afternoon to me for ever memorable.

I was in the garden, in a shady little glen, where a seat had been erected under a droop-

ing tree, beside a miniature cascade, and the leaves were fresh and green. This was one of my favorite spots; and I was thinking of Nevil, when, to my surprise. Edgar Dana appeared.

"How did you find me?" I asked.

"The gardener told me where you were."

He looked pale and tired, and leaned with an air of weariness against the tree.

"I meant to have called before, but General Polwyn had a great deal of writing for me to attend to. Have you heard from Edith?"

"Yes, she has written once."

"Does she say anything about returning Miss Lovel?"

"She has scarcely gone yet," I said smiling, "and we don't expect her until Summer. I have read your play, and I like it very much.'

"Do you really?" he cried, brightening. "It is worth something, then; it will succeed!"

"I cannot say that. I think it rather a poem than play; but my judgment may be erroneous, for really I don't profess to be a critic. You should ask the opinion of some one else."

"But whom could I ask, Miss Lovel?"

"Mr. Verner!" I suggested rather dubiously, because Nevil and Edgar had not got on very well.

"No; I don't know him well enough!"

"Then who could be better than Brandon? He has passed nearly all his life in study; he has read a great deal, and he has a fondness for literature. He will understand this much better than I can."

"I don't like to ask him," said Mr. Dana, pulling leaves from the bough above him.

"Why not? He is happiest when he is pleasing others. I assure you he would be glad."

"I scarcely—we have not made friends—a——"

"Do you know, I quite expected you to like Brandon, your tastes being similar! Do ask him this, and you will thank me after."

"I'd rather not," he said, with the old nervousness.

"You might be afraid of him. I can't understand why you avoid him, for though grave, he is goodness itself, and he has shown you every kindness, hasn't he?"

"Yes—oh, yes, Miss Lovel!"

"You will understand me," he said, in a low voice, and coloring deeply, "when I tell you that you were right—I am afraid of him."

"Afraid of Brandon?" I almost laughed. "Is he so very terrible, then?"

"Please explain yourself. Why do you fear Brandon?"

"Dear Miss Lovel, I don't want to say anything that may pain you; only remember his father's death, and you will see that I can't make a friend of a—a man like that!"

"A man like that! Then you visit the sins of parents on children, and hold Brandon responsible for his father's follies?"

"Is it that you will not understand, Miss Lovel? I cannot make a friend of Brandon because I fear him; as you know, I have reason."

"Will you, for mercy sake, be clear? I do not know what you mean. You fear him—the gentlest of men! You cannot make a friend of him whose friendship I would not forfeit for all that the world could give!"

His expression changed at once to fear and horror.

"Is it possible you do not know? I should not have said this. Forgive me, and I will go——"

"You *must* speak out now! What is it that I do not know? I implore you to tell me!"

"Miss Lovel," he said, greatly distressed, "what I could tell you would only give you pain."

"Do you know something against Brandon?"

"Yes!" he said, very unwillingly.

"You must tell me! I demand an explanation!"

"And I—forgive me—will not give it."

"But I entreat you to tell me! In Edith's name, I ask it! It is cruel of you to leave me in torture!"

"You do not know what you are asking, Miss Lovel! If you insist on an explanation, I must give it: but believe me, that had I known you were ignorant of his story, I would never have spoken. I thought you all knew it, and was surprised when I found how cordially he was received; but I could not help fearing him, and shrinking from him. I suppose I am queerly constituted, but I did not like to take a hand stained with—stained with—blood!"

"Sir! he has not injured you that you need traduce him!" I cried, hotly.

"Unfortunately it is true!" he said, with sad compassion. "Do you know anything of his father?—does he ever speak of his death?"

"Not to me. I know the death was sudden."

"Father and son did not agree, and Brandon benefited by that death. Yes, it was very

"I cannot misunderstand you; but look at Brandon's life!"

"I have heard of men living lives of atonement, and unfortunately I know too much. My guardian was a firm friend of Brandon's father, and he had the secret. I have told you that I was with my guardian when he was ill. He was often delirious, and in one of these intervals I heard the name of Lovel, which immediately attracted me, because I knew he had lived in the same county as were Edith's relatives, and he had known them well,"

"Continue. He said something?"

"He had been muttering something, of which I could hear nothing, when suddenly he raised his voice, as if in entreaty, saying, 'Go away, Brandon! What, strike him to whom you owe your wretched life!' and seemed to struggle with someone. Then, pointing before him, he cried: 'Too late—too late! He is dead! Go away at once, Brandon. You have done enough!' Then he fell back, sighing: 'His own father! It is terrible! Don't fear, I will keep the secret, for it stains your name, and the world shall never know this. What did you do with the dagger?' Oh, Miss Lovel, I fancy I hear his voice now! Thank Heaven I was alone with him. That night he died. In his desk I found a fragment torn from a letter. There were other torn pieces, but this was larger than any, and on it were these words: 'Killed by my hand, the hand of his only son!' My guardian's lawyer wrote to Brandon, acquainting him with the death, and Brandon replied. I saw the letter, comparing it with the fragment I had, and found the writing exactly alike. The peculiar formation of the 'a's and 'e's could not be mistaken. I burnt that fragment. That day, when I was coming here as secretary to General Polwyn, Edith was in the same compartment, and she spoke of her relatives, of Brandon, saying that he had never been the same since his father's death. Is it any wonder that I fear him?"

"It cannot be true!" I cried.

CHAPTER XI.

"I have heard that Brandon's father was unkind to him; and the Lovels are thought hot and fiery," said Edgar Dana.

"Yes, we are hot and fiery, but pride is also ours! Does a proud man stoop to crime?"

"I cannot say. Forgive me, and believe that to no one else will I ever speak of this—on my honor!"

"Your guardian did say that? You saw those words?"

"Yes, I did indeed."

"Then please go!"

He bowed and left me; and when he had gone—when the echo of his footsteps had died away—I fell on my knees, sobbing in agony. Oh! why had memory been given me, for one by one words and scenes returned, piercing my heart as with a thousand swords.

There had been a mystery about Clarence Lovel's death. Though he had been ill, his illness had not been considered serious, and aunt had told me that the announcement of his death had come on her like a thunder-clap. He had not been kind to Brandon, I knew. I thought of the latter's gloom and melancholy, which had so long perplexed me, and Edith's words came back all too clearly: "I saw him a little while after his father's death, and he looked wretched; but there was no reason why he should break his heart over the loss of such a parent." And the evening when aunt had told him he would lose his memory he had answered, "I wish I could!" Why did he wish it? The shadow between us two—what was it? What had changed him? "If there be a shade between us, it is through me it comes. I am reserved with you: but it is better so—how much better you will never know! We are not as we once were, and why we are not is better unsaid!" These were his words, and they echoed in my ears again; but he led a good life. Was it indeed in atonement and expiation? I thought my senses were going, my agony was too great for tears, when I heard aunt Dorothy's voice calling me. She must not see a change in me or know this dreadful story, and I rose, straining every nerve to regain composure; and I retained it—I do not know how—throughout the day.

But in my own room there were none to see me, and in pain and misery I walked to and fro, thinking of what I had heard. Well indeed might there be a shade between us—black as night it rose; well indeed might he be melancholy and sad, though wealth and honor were his. I fought against the thought—I shrank from it in vain; and through the night I shuddered in solitude, hearing only those words, "Killed by my hand," seeing only his darkened face.

I tried to sleep at last, and then the flash of the diamond ring I wore roused a new train of thought. There was my refuge—the true, pure heart that was my own, the faithful love that crowned my life; but even the thought of him turned to bitterness. Suppose this story, which cast a stain on our name became known, would Nevil turn from me? and was this to be the test of his love?

The first ray of light woke me from a troubled slumber—from the brief forgetfulness to recollection; and I rose at once, gazing through the window, and thinking how dimmed was the glory of dawn. I stole from my room and went quietly to the gallery, looking at the portraits as I passed. The last of all was Brandon—Brandon as a boy; but a mist rose between it and my eyes, from which the tears fell quick and hot. I could not believe him guilty. The dear friend of my youth, the brother whom I reverenced above all, was not guilty!

Again I thought of Nevil; his love would be my shield; he would be true through sun and shade.

When breakfast was over I gladly went out to the garden, for it was as much as I could do to appear composed and cheerful before aunt Dorothy, and I would not have her see me depressed.

I must forget what I had heard, that was the only thing I could do; and I occupied myself with the flowers, I read and talked, and the morning passed away.

How long it seemed since yesterday! How slowly did the hours drag on! Try as I would to forget, my thought would go to Brandon and this story. Was it true? Could I believe it of him whose life had been so long linked with my own, and who had been to me the ideal of manhood? I had thought him as one of the old heroes of our house—that in him the virtues of our race were united, without its faults.

I heard a footstep on the gravel, and knew someone must be coming. Perhaps it was Brandon himself; and I felt cold and faint. I need not have distressed myself. It was not Brandon, but Edgar Dana who appeared. I hoped he had come to tell me that it was not true, and I spoke calmly enough, resolved not to let him see that I had doubted my kinsman.

"I will not stay," he said. "I left you looking so pale yesterday that I feared you would be ill. Oh! Miss Lovel, how grieved I am that I told you! When I got home, and thought over all, I felt ashamed and miserable. It was such a return to make for your goodness."

"Blame me for demanding the explanation," I said. "I am not ill though. What you told me yesterday you have promised to keep secret, and I will yet ask another favor. Never—never speak of it again to me. Let the subject forever rest—be as though you had not told me!"

"Miss Lovel," he said, with boyish eagerness, "the sight of me, after the forbidden subject, can only bring you pain. If we don't speak of it, we cannot help thinking of it, and it is better for me to keep away until you forget. I can plead my duties as an excuse."

Before I could reply he was gone. Perhaps he was right. I understood and appreciated his delicacy, thanking him for it mentally.

As I had expected, evening brought Nevil, and I banished all painful thoughts. He was quiet to-night, and when I remarked on his silence, said that he was tired.

"Oh! Nevil, dearest, are you ill?" I cried.

"Out of sorts, anyway. But you needn't alarm yourself. I shall be all right soon."

Nevil's visit did not give me the comfort for which I had longed, though why I could not tell. He had seemed weary and languid. Perhaps I was journeying to a new sorrow.

The next evening brought Brandon, and how easily and calmly we met, without change in our greeting. For a moment the feeling of dread and faintness had chilled me, but his dear, kind voice drove it away as clouds before sunlight; he had been so long associated with peace and sincerity in my mind that the meeting over which I had sighed brought relief.

As he sat with aunt Dorothy, moving the chess-pieces to and fro, I studied his face by the light of what I knew; the power of the firm lip, the eye with its piercing light, the straight, broad brow, every feature was familiar and dear, but need there be a cloud upon him? It was no fancy caused by Edgar Dana's story; the shadow had been seen by me before I knew that. And what were his secrets, to cast so deep a gloom upon him? Yet it had faded sometimes; the smile I had known in bygone days, that trembled on the lips and flashed in the eyes, had swept away that sadness, but oh, how rarely!

"You do not look well, Kate," he said, when he was bidding us good night. "Don't give Diamond too long a holiday. I have brought you a new book—a good one."

How ashamed I felt: how his kindly interest pained me when I remembered what I had thought of him!

Spring went by, and Summer, rich with flowers, crowned with stars, and robed with sunset glories, had returned. Spring had been darkened for me by Edgar Dana's revelation, but outwardly I was unchanged to Brandon—my affection had never for a moment faltered, even though my trust had been shaken.

Mr. Dana had kept his promise to me. We say very little of him now, and I knew why he kept away. Once he had called to ask about Edith.

Edgar's revelation must have had a greater influence on my mind than I had first supposed, and caused me to look on the world with a jaundiced eye, for I thought even Nevil strange.

I saw him often, and spoke as fondly to him; but he was silent, and weary, and cold. Or was it not my imagination? Troubled by thoughts of Brandon, depressed and sad, it was only natural that I should fancy things which could not exist; or Nevil might have some trouble which he could not tell me; so I tried to express in deeds the sympathy I could not in words."

"Nevil, have you some trouble that you can't tell me?"

"Why do you think so?" he said, surprised.

"You are so silent; not like what you used to be. I have even fancied something had come between us."

"What could? Surely you are growing fanciful, my dearest girl. I may have annoyances but how am I changed to you?"

"I cannot put it into words, Nevil."

"Can't you? Don't you think you were unkind to doubt me, for what you say means only that? What cause have I given you to do so?"

"Forgive me, dear; I had no thought to pain you; I only meant to be open and candid."

"Then, love, state your complaint openly and candidly."

"I thought you were troubled, or that I had vexed you in some way. Imagination, perhaps; but the least coldness on your part wounds me a thousand times more than could that of any other."

"We are moping too much, perhaps. At least, put these idle fancies away, Kate."

To be Continued.

NEW PUBLICATIONS.

The Wilderness Cure. by MARC COOK. Wm. Wood & Co., N. Y.

In this neatly bound, well printed book, is told the story of a young man's exploits in the wilderness in search of health. It tells all about camping out for health; how to do it; its cost, and what is requisite. It will be read with interest by all who peruse it.

Rules of Proceeding and Debate. By LUTHER S. CUSHING. Boston: Thompson, Brown & Co. Price 75 cents.

This manual of parliamentary practice is, by common consent, the accepted authority. It contains all the essential, practical points of Cushing's "Law and Practice" and is sufficient for all ordinary uses. Its extended circulation gives proof of its worth.

Food for the Invalid. By J. M. Frothergill, M. D. Edin. and Horatio C. Wood, M. D., of the University of Pa. New York, Macmillan & Co. Price, $1.00.

This little work of 157 pages is worthy of a place in every family. It is designed for the convalescent, the dyspeptic and the gouty. In the introduction much valuable information is followed by various recipes for food for the invalid.

The Diet Cure—The Relations of Food and Drink to Health, Disease and Cure. By T. L. Nichols, M. D., Editor of the London Herald of Health. M. L. Holbrook, publisher, 13 and 15 Laight St., N. Y. Price, 50 cents.

There have been, from Hippocrates to Gull, many sensible physicians and some of the best of them are quoted in "The Diet Cure," which teaches that pure food makes pure blood, and pure blood builds up a healthy body. It is full of information on various health-topics.

THE Sunday newspaper is published, but you need not read it. The Sunday excursion is advertised, but you are not compelled to go upon it. Your neighbor may employ the day over his business accounts, but that does not affect the question of your duty. He may spend it in idleness at home or in the entertainment of friends, but that does not close the church doors to you. The command is: "Remember the Sabbath day to keep it holy." You can obey the command.—Christian Weekly.

WHAT sunshine is to flowers, smiles are to humanity. They are but trifles, to be sure, but scattered along life's pathway, the good they do is inconceivable. A smile accompanied by a kind word has been known to reclaim a poor outcast, and change the whole current of a human life. Of all life's blessings none are cheaper, or more easily dispensed than smiles. Then let us not be too chary of them, but scatter them freely as we go, for life is too short to be frowned away.

THAT God is above all, and behind all, and beyond all, is what the Christian sees in every tiny blade and trembling petal, and in the song of every bird.—Christian at Work.

For Women.

CONDUCTED BY MISS RAY CLARK.

KISSED HIS MOTHER.

SHE sat on the porch in the sunshine,
As I went down the street—
A woman whose hair was silver,
But whose face was blossom-sweet,
Making me think of a garden
Where in spite of the frost and snow
Of bleak November weather,
Late, fragrant lilies blow.

I heard a footstep behind me,
And the sound of merry laugh,
And I knew the heart it came from
Would be like a comforting staff
In the time and the hour of trouble,
Hopeful and brave and strong,
One of the hearts to lean on
When we think that things go wrong.

I turned at the click of the gate-latch,
And met his manly look;
A face like his gives me pleasure,
Like the pages of a pleasant book.
It told of a steadfast purpose,
Of a brave and daring will—
A face with a promise in it
That God grant the years fulfill.

He went up the pathway singing;
I saw the woman's eyes
Grow bright with a wordless welcome,
As sunshine warms the skies.
"Back again, sweet mother,"
He cried, and bent to kiss
The loving face that was lifted
For what some mothers miss.

That boy will do to depend on,
I hold that this is true—
From lads in love with their mothers
Our bravest heroes grew.
Earth's grandest hearts have been loving hearts
Since time and earth began!
And the boy who kissed his mother
Is every inch a man!

EBEN E. REXFORD.

CONCERNING THE CARE OF CHILDREN.

MARY WAGER-FISHER.

I WAS a visitor at a house a short time ago where one of the members of the family, a little girl of four or five years, was the object of much solicitude by her parents. She was a bright and pretty child, but had suffered from attacks of "fits" or "spasms." The immediate guardians of the child seemed to be intelligent, sensible people, and I was amazed, while at dinner, to see the little girl served the same as an adult, with rich and hearty food, including even chow-chow, apple pie and coffee! It was no wonder the poor little creature had "fits," or whatever the nervous malady may have been that was so designated. The ignorance displayed in the diet of the child was too utterly abominable to be excused, and I was scarcely able to hold my tongue from crying out against it. But I eased my conscience in answering the question how I managed to give my little boy his look of superb health by emphasizing the fact that he had never so much as *tasted* coffee, or apple pie, or chow-chow, or various other things commonly allowed to children.

The other day an acquaintance complained to me of the dainty appetite of her children, of their leanness, their propensity to be "forever on the stretch," their total disinclination to take sufficient sleep and rest. The children were often guests at my house, and I knew that the most delicate one of them all had never been trained to drink pure milk. The stuff she daily drank was a mixture of warm water, milk and sugar. All the children ate candy, cakes, fine crackers, and were put to bed much later at night than they should have been. To my mind there was nothing surprising in the fact that a good appetite was a stranger to her little ones, or that they were lean and unduly active.

Another mother declares that her children always have "colds" from October until June. She dresses them daintily, in apparel both fine and costly, in sealskin coats, muffs, tippets and things of such ilk. Their frocks are worn very short, their drawers are of finest cambric, and their only "under flannel" consists of a fine and dainty knitted shirt, so that while the upper portion of the body is well protected and over protected in a sealskin garment, the lower part is very shabbily clothed so far as warmth goes. The cold scurries up the poorly clad legs, which the short petticoats—handsomely embroidered—fail to protect. With the clothing of the body so unevenly distributed, is it any wonder that the children always have colds? A good woolen undergarment, cut to fit the body, arms, legs and all, and worn next to the skin, would do more for the welfare of her children than all the sealskin coats, feathered hats and ornamented toggery in the universe. There is something atrocious in sacrificing a child's health to finery, or in being so ignorant and careless as not to know that it *is* being so sacrificed.

Every nine men out of ten that have achieved distinction in this country were in childhood inured to plain food and clad in cheap, often mean, apparel. Nobody looks for great men or great women from the homes of wealth where luxury abounds. A certain amount of hardship seems indispensable to the development of character. Who can imagine the brave man, (whose death we all so deplore, and upon whose coffin were heaped more honors than were ever before laid upon that of any person who has hitherto lived and died) as reaching his high place from a boyhood pampered in luxury, nursed and reared by a mother who coddled him with dainties and tricked out his body in furbelows!

What is it to us, who are grown to womanhood or manhood, that we wore broadcloth, or "linsey," or silk, embroidered or patched garments in our childhood, calico or India mull, whether we had ribbons, or laces, or sashes, or ruffles, or finery of any sort? It is of not the smallest real consequence. What is of real consequence, however, is that we had plain, nutritious food, so that our bones and our teeth were properly supplied with building material, that we were healthfully clad, that we were taught to breathe well, to chew our food well, to sit and walk erect, to be truthful, honest, clean, industrious, earnest, to read only *good* books, to take excellent care of our teeth, and—to speak good English. If I could be born again, and could have my parents perform but two duties for me, the one would be to make me a splendid animal physically, and the other, to have me taught to speak my native tongue finely. Given those two things at eighteen years of age, and after that, every other desirable earthly thing can be acquired if diligently sought.

If parents could only discern between important and unimportant things, and hold to the former and discard the latter, how immeasurably the welfare of the race would be advanced. But they waste and worry themselves over trifles especially the mothers, who will sit up o' nights and prick their fingers sore over some foolish bit of finery—and perhaps weep and sigh and be very unhappy because their little boys or girls can't have hats and frocks like certain other children. Oh me, how foolish! Or have money for a "start in life." How much money had Garfield or Lincoln, or Edison, or Howe, the inventor of the sewing machine, or Stephenson, or Fulton, or Christopher Columbus, or A. T. Stewart, or Vanderbilt, or Harriet Beecher Stowe, or Jenny Lind, or Rosa Bonheur, or Ida Lewis, or John Roper, or John Bunyan, or General Grant, St. Paul, or Michael Angelo, with which to make a "start in life." The best wealth to make a "start in life" on, for man or woman, is a good strong body, good principles, good character and industrious habits. Perseverance is genius, energy is talent, and industry and economy united with tend-to-your-own-business, mean competence.

To conclude for this time, I would like to put a few things plain. One of them is this: See to it that the children's teeth are well cared for, if they never have a "Sunday" garment. Give them plenty of oat meal, milk, good bread and fruit, and don't worry if they haven't meat once a year. Train them to grow erect, deep and broad-chested, hardy and fond of work, and never mind the fashionable cut of their clothes. Do these things and your children will not fail to "rise up and call you blessed."

"LOOKING OVER THE OLD PAPERS."

CARRIE V. SWEET.

GOING into a little-used but large and well-lighted clothes-press, a pile of old newspapers met the sight. Instantaneous with this view came the desire to look over those old papers; two, three and four hours found us bending eagerly over their various columns, perusing articles on all household subjects inclusive from cellar to garret.

There were recipes for cooking, baking, canning and coloring; instructions for knitting, crocheting, embroidering and painting, with hints upon visiting, reading and letter-writing. All written clear and concise, yet so full that one could follow them with little difficulty. It seemed as if the old papers had grown more interesting as they grew in years. Their contents embodied a good deal of matter, and undoubtedly the second reading brought to light much that had been merely glanced over at the first; or perchance the intervening days had been rife with an experience that had quickened our understanding. However, be that as it may, we fell to musing and querying as to what had become of the hands that had guided these several pens in the days gone by. Were they warm and active, or were they folded quietly and silently? It mattered little whether the pen was gold or not, the words it had traced were golden. Not light, trifling, airy nothings to amuse us for the hour only, but practical, good sentiments, so concise and clear that one seeing them could understand, feel and remember; thus they make an impression not easily erased. They were not sad, sombre nor dry, but they contained something, or things worth knowing. We felt we had learned much and were better able to work out our home-life more satisfactorily—better able to do or direct the doing of various household duties. Our wilted ambition had been refreshed, our tired flesh revived, and, withal, our silent visit with those old papers had done us good. We knew more of the practical side of life and could cope with more of its varying problems. We had learned how to set the table more skillfully, how to arrange articles in the parlor more tastily, how to renovate and renew furniture more deftly, and what to make over and how to make it. We had read various articles on various subjects and had learned a little from each one. Thanks welled from our hearts toward all these several writers, and we blessed the day we sat down to look over the "old papers."

"THAT CHIP."

I HAVE many doubts as to whether "that chip" is, as yet, knocked off by O. W. D.; certainly it was not by her last communication. Oh, no! I had no doubt whatever as to the location of the text which she hinted at and failed to correctly quote in her first communication but which in her "revised edition" of October 8, was correct. That's Bible, of course; but, "by the sweat of thy brow thou shalt earn thy bread" is not Gen. III, 19, nor Genesis anything else; but, as she was on the cars where she could not consult any authoritative Bible, an error in quotation from memory is quite excusable.

I have very carefully perused O. W. D.'s last article, and have been greatly puzzled in interpreting some parts of it. Here is one passage, "When the world through the eyes of Adam and Eve saw vice, become as gods knowing good and evil, choose the evil, they could not be left idle longer." What became "as gods," etc.; who knew "good and evil"; who "chose the evil" and who "could not be left idle longer!" Will O. W. D. parse and explain?

"I can agree with her that a curse was pronounced, but it was on Adam not on labor. Would labor have been less fatiguing to us if no curse had been pronounced on it as she asserts? Is it because it is accursed that it is hard for so many to bear with it. If we are to consider labor a curse what shall we do with such passages as Prov. xiii, 11; xiv, 23; Ecc. v, 12; Eph. v, 28?

O. W. D., says all vices are curses to humanity. True, but how came they to be so considered? By the evil effects and influences they have on mankind. Bring labor, as a curse, to this test, and ascertain its effects, its influences, its results. Does it degrade and impoverish man and render him but a little better than a brute. If so, then by our test, it may be classed as a curse with intemperance and other vices. But does it not tend to elevate and ennoble him? If so, then it should not be classed with intemperance and kindred vices, or curses in other words. Judging labor as we judge vice we find ever divergent effects, the results of the former as a general thing tending toward the good, of the latter toward the bad. O. W. D. intends to take her share of the curse cheerfully "though originally it was not intended for the woman." How comes it now that labor is a curse to her for whom it was not intended! If the curse lies in its pronunciation upon Adam, and not on Eve, then labor is not a curse for woman; but to draw such a distinction, is folly. O. W. D. exhibits remarkable magnanimity in thus assuming a curse which is not justly hers, and probably does it on the principle that what is her husband's is hers, and what's hers is her own. However, opinions will differ, and if O. W. D. wishes to consider the performance of her daily duties a curse to her, I shall no longer object. J. W.

CORRESPONDENT'S CORNER.

PLEASE tell a farmer's daughter, one who likes to keep up with the times, what kinds of head coverings are mostly worn. PANSY.

We should say *red* for color, though there can be seen dark olive, browns and navy blue. But shades of red, such as garnet, dark wine and maroon, dot our congregations and places of amusement very closely. And *four* long feathers are not out of place on one hat, as they are so very large. A milliner was heard to say that where last year one-half yard would cover a frame, this year she used one yard and a quarter. Of course the trimmings are in accordance. But unmistakably dame fashion orders the head covered with a spacious bonnet of any shape one may choose.

WILL you be so kind as to show through the columns of the RURAL some pretty styles for making ladies' dresses. I made one last Winter after a pattern you published, and liked it very much. E. A. S.

To E. A. S. We would refer you to cuts in the RURAL of last week for information desired.

Domestic Economy

CONDUCTED BY EMILY MAPLE.

ECHOES FROM EVERY-DAY HOUSE.

ANNIE L. JACK.

"I wonder who invented salsify?" I said to the amateur cook, for it is a vegetable that was not heard of in my young days. "I think," she answered profoundly, "it must have been in a year when oysters were scarce, or some one had a 'corner' in that delicacy," and she scraped the salsify for lunch, at the same time humming:

"If he's content with a vegetable love,
That would certainly not suit me——"

There was a simmer in the pot and the singing stopped, while she lifted the lid from the mock oyster stew. As this vegetable stays in season from early Autumn till asparagus is ready for the table, it is worthy of the cook's attention, and when cooked in a stew is relished by those who like oysters in that form. But in preparing it for the table there is a great deal of care necessary It requires thorough scraping and must be quickly placed in cold water, and from that into boiling and *cooked* to prepare it for anything. It is very palatable made into fritters, thereby imitating fried oysters. As the same plan is given for parsnips I will copy from Practical Cooking the method there employed for making parsnip fritters: Scrape, cut if large, and put into well salted boiling water. When tender, mash, adding to each four or five parsnips a heaping teaspoonful of flour, one or two eggs well beaten, pepper and salt to taste. Form the mixture into small cakes three-quarters of an inch thick and two and-a-half in diameter (They are smaller for salsify to imitate fried oysters.) Fry to a delicate brown on both sides with a little hot butter, and serve hot. I often think we do not pay enough attention to variety in vegetables, especially in Winter, and everything that contributes to a healthful change, should be made the best of by those who have to cater for a family with different appetites and needs. The long Winter without a supply of fresh vegetables, and with only a limited supply of fruit is calculated to leave the members of a household with impure blood and subject to the diseases consequent on such a condition.

NOTES.

IT is said that there is nothing that Americans are more ashamed of than economy. And shame upon them that it is so.

Never put pieces of raw pastry left from baking into the flour barrel—it causes the flour to become musty and sour.

When one has a large ironing to do, it is much better to iron the fine pieces first. One can then expend upon them the necessary amount of patience and strength to cause them to look nicely. If the laundress has tired herself over the coarser articles she will have little patience left for the shirts, collars, etc.

Phosphate of soda is recommended to remove ink stains from colored fabrics where there is danger of removing the color as well. The spots are moistened with warm water and rubbed with the phosphate and then covered with a thin layer of tallow. After this wash in warm water. If the first application does not remove the stains, repeat.

A Discovery.

The Medical Record gives to us a new remedy for chills and fever, namely that of swallowing a *live spider*. This is said to be a sure cure and we predict an everlasting fortune for the enterprising individual who will raise and encase these animals in gelatine capsules such as are now sold by druggists to cover quinine and other bitter pills. A word to the wise is sufficient.

Warts on the Hands.

The best remedy we know of for these unsightly excrescences is to pare off the hard part frequently and as closely as one can without bearing too much pain. A large wart on the inside of the writer's fore-finger, which was very annoying, especially after the finger had been in water for any length of time, was entirely cured by this treatment. Time six months.

Too Much of a Good Thing.

I admire thorough, methodical and neat housekeeping But it is often carried too far—it is allowed to interfere with the happiness of husband and children. The mother becomes petulant and careworn. Her life is a continual round of sweeping, cleaning and fault-finding. From such deliver me. I prefer a judicious mingling of dirt and happiness. E. K. R.

QUESTIONS ANSWERED.

CHICORY.

WE have a quantity of chicory. Please tell me how to prepare the roots for mixing with coffee, and oblige. MRS. E. B.

ANS.—Wash carefully and scrape. Cut into little bits, dry and brown in the same way you would coffee. Then grind in the coffee-mill.

News of the Week.

HOME NEWS.

MONDAY, Nov. 28, 1881.

THE GUITEAU TRIAL.—On the 21st inst, Mr. Robinson, the associate counsel for Guiteau, withdrew from the case. Owing to the "unpleasantness" existing between Mr. Scoville and Robinson, the latter thought it necessary for one or the other of them to leave the case, and as the relations which Scoville sustained to Guiteau were intimate and as he was indispensible to the defence, Mr. Robinson thought it were better to withdraw. Judge Cox gave him an honorable discharge. After the examination of Surgeons Barnes, Woodward and Lamb the prosecution rested their case. On the opening of the defence Guiteau made a short speech in his own behalf, and Mr. Scoville addressed the jury in a plain, matter-of-fact style and the court adjourned for the day. Tuesday the counsel for the defence continued his case, and endeavored to show to the jury that Guiteau had done much in the past that denoted a derangement of the mind. The instance of his attempt to kill his sister was among the citations. Mr. Scoville was frequently interrupted by the prisoner. The examination of witnesses for the defence took up the balance of the week, several experts in insanity having been summoned to testify, besides those who have been acquainted with him in various places. On Saturday Mrs. Scoville, (sister of the prisoner and wife of Mr. Scoville, Guiteau's counsel,) was put on the witness stand, and her testimony will be continued to-day. To-morrow Guiteau will take the witness stand.

On the 25th ult., the Grand Jury returned an indictment for assault with intent to kill against Jones, who shot at Guiteau in the prison van. The extreme penalty that can be inflicted upon Jones providing his guilt is proven, is imprisonment for eight years.

The Exposition at Atlanta on the 24th had its biggest day since the opening; 19,320 persons were registered at the turnstiles, among whom were over eight thousand college students and pupils of seminaries. Intense interest pervades the South as to the convention of planters, agriculturists and mill men that will meet December 6. All these great interests will be represented by thousands of persons, and the outcome is expected to be of vast benefit to every Southern industry. Thirteen thousand strangers are comfortably housed in Atlanta, with room for 10,000 more.

The pension rolls for the month of December amount to very near $8,000,000, and this bonanza is increasing in width and length, and depth too.

Preaching in first-class churches in New York pays almost as well as banking or the law. Rev. Dr. Dix, rector of Trinity, gets $12,000 a year and a house worth $4,000 a year, and Dr. Morgan gets $8,000 a year and a handsome house.

The postmaster general has decided that printed matter is not personal correspondence and may be enclosed with merchandise and mailed at the latter rates. Postal cards printed and directed to publishers may be sent as second-class matter.

At a special election in the First Congressional District in Rhode Island, Mr. H. J. Spooner was elected by 1787 majority to fill the vacancy caused by Mr. Aldrich's promotion to the Senate.

Gov. Cornell of New York has appointed Judge Charles Andrews of the Court of Appeals chief judge of that court to succeed Judge Folger, and Charles L. Benedict of Brooklyn to succeed Judge Andrews.

The Irish National Land League of America sent to Ireland the last quarter $127,835.

Insurance Commissioner Brooks of Connecticut has ordered the winding up of the Atlas Fire Insurance Company of Hartford. Its capital is only $100,000, and for several years it has been doing very little new business. With this small company retired there will be no stock fire insurance companies in Hartford with less than $1,000,000 capital each. The action of the Insurance Commissioner is in accord with a vote of the board of directors. The risks of the Atlas will be reinsured and the only loss falls on the stockholders.

The employees of the Executive Mansion expect the President will move into the White House Tuesday next. It is understood that the President will appoint F. J. Phillips private secretary as soon as Mr. Brown retires. Phillips has been the President's private secretary for a number of years. The President has appointed J. Samuel Frazier, of Ohio, interpreter to the legation in Japan.

A despatch from Springfield, Ill., states that the flood in Sagamond river damaged property to the extent of $250,000. Two hundred head of stock were drowned.

An interesting ceremony took place at the grounds of the Hebrew Hospital, at Baltimore, Md., on the 24th ult., consisting of the planting of a tree as a memorial to the late President and to be known as the "Garfield Memorial Tree." The contributions to the memorial were all made by prominent Hebrews.

It is said that Mr. McCormick, the reaper manufacturer of Chicago, and Mr. William N. Whitley, the reaper manufacturer of Springfield, Ohio, have formed a partnership, combining the improvements of each machine. It is reported that McCormick's capital is over $10,000,000 and Whitley's over $1,000,000. The firm will hold a monopoly in all the world in the reaper business.

In New York there are about 500 venders of sawdust, having a capital of $200,000 invested, and doing a business amounting to $200,000 annually.

Director Burchard announces that the United States Mint, at Philadelphia, coined $50,000,000 in gold during the last 12 months, or five times as much as during any previous year. Much of this was foreign gold recoined.

An iniquitous speculation has been unearthed by the trustees of the Hancock County Infirmary, at Findlay, Ohio. Several prominent men of that city have been securing insurance on the lives of paupers for the benefit of themselves. One old man was induced to sign the application by the statement that it was a call for a political caucus. The life of another very feeble pauper is insured for $75,000.

Maxwell, alias Williams, was lynched at Durand, Wis., Saturday. He had confessed in court that he had killed the Coleman brothers, asserting that it was done in self-defence. Immediately a rope was thrown around his neck and he was dragged through the aisle into the court house yard. Death, however, ensued from strangulation before a tree was reached.

A Pittsburgh glass manufacturer proposes to erect buildings of glass, manufacturing the material the size of a common brick. He says that the cost will not exceed that of a cut granite building, and with the material colored, fine effects can be gotten.

California yields the precedence to Colorado in the production of the precious metals. Last year the former State yielded $19,000,000, and the latter $23,000,000.

A Good Healthy Appetite.

A patient says: "I have taken a great many things, but never in my life took anything like the Compound Oxygen. *I feel so strong and well, and have such a good, healthy appetite.*" Treatise on Compound Oxygen, *sent free.* Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa. —*Adv.*

AGRICULTURAL NEWS.

MONDAY, Nov. 28, 1881.

The following items of agricultural news have been condensed from telegrams received in this city between Friday noon, Nov. 25, and noon to-day: Portland, Me.: Produce market less active; prices off, especially for potatoes. Hay has advanced chiefly on account of bad roads. The prospect is that 50 per cent. more timber will be cut in this State than for several previous years.....Boston, Mass.: Flour market still dull. Provisions fair; prices firm.....Buffalo, N. Y.: Wheat dull; $1.52 asked for No. 1 Hard Duluth; red and amber Winter wheat, $1.38@1.40; corn, No. 2 mixed, 65¾c.; oats quiet; No. 2 mixed western, 49½c.; barley steady; Canada, 95c.@$1.15; six-rowed State, 80c.@$1.10.. Cincinnati, O.—Receipts of breadstuffs are light, and prices are downward. No. 2 Red Winter Wheat, $1.30@$1.37½. Corn strong, No. 2 mixed 47½. Receipts of hogs good, prices firmer.....Dayton O.—Very cold and raw; first snow storm of the season last Wednesday. Among hog owners there's a tendency to hold the hogs back for colder weather; but with corn at 55 cents per bushel there's not much ground for speculation when the owner can get 6½@7c for his stock. First-class cattle in demand; but the sheep market is decidedly dull.....Philadelphia, Pa.: No change here in wool market. It is said a great deal of wool is held in Boston, on which the banks have made advances, and should the late bank defalcations there, cause these loans to be called in, a large quantity of wool will have to be thrown on the market, which will cause a break in prices. Holders here, however, are firm, and so is the general tone of the market. Trade in flour and grain not active; prices about the same as last week. The supply of plump, heavy hides is not equal to the demand and prices are very firm. Green salted stock, too, sells freely at good figures.....Indianapolis, Ind.: Country roads in very bad condition. Weather cold. Wheat has declined but the prices of other staples are fairly maintained. .....Evansville, Ind.: Grain is beginning to move; corn is coming in briskly at 63@65c. for car-load lots; wheat quiet.....Chicago, Ill.: A good speculative business in grain but hardly anything done on shipping account. Receipts for the week, 55,000 barrels flour; 196,097 bushels wheat; 632,851 bushels oats. Shipments were 97,593 barrels flour; 213,465 bushels wheat; 955,827 bushels corn: 126,783 bushels oats. A much larger movement of money towards the country.....Detroit, Mich.: Large speculative transactions in wheat daily. Market unsettled and sensitive..... Milwaukee, Wis.: Inclement weather and very bad roads hindering work and business in country places. Recent cold not severe enough to harden the roads so as to allow the marketing of produce. The wheat market has been unusually dull and weak; receipts and shipments both meagre. Millers are idle..... ....Louisville, Ky.: Leaf tobacco still firm. Grain dull and easy. Weather clear and cold; pork packing consequently active. Hogs scarce, bringing $6@6.60—or about one-third above last year's prices. An increasing demand for currency from the country owing to pork-packing operations.....St. Louis, Mo.: Grain and flour still weak. Provisions declining. Hogs in demand and firm at $6.60; but they are of low quality. The river is falling, and trains have resumed their free movement of produce.....Kansas City, Mo.: Cattle receipts for week only moderate, owing to falling off in Colorado and Texas shipments. Market quiet. Receipts of hogs the heaviest of the season—one day's receipts the largest ever known here. Market well sustained. Bulk of sales at $5.35@6..... Omaha, Neb.—Weather for the week cold and clear. Roads frozen in a rough state, and travel therefore difficult. Coal reported very scarce throughout the State. Winter supply not yet received.....San Francisco, Cal.—Provisions lower than last week. Wheat weak; barley and oats higher.....Baltimore, Md.—Canned goods in demand; prices have an upward tendency. Can makers on a strike for 30c per 100—an increase of 5c. Cotton receipts heavy. During the week prices have advanced ¼c@½c; but the market now is easy. Brokers and commission men think prices will continue upward. Southern wheat dull; Western, heavy with a downward tendency. Corn market inactive; prices lower. Jobbing trade in provisions brisk with firm prices. There's an active inquiry for grain vessels since the decline in grain..... ..... Wilmington, N. C.: Cotton firm; picking retarded by scarcity of laborers. Provisions steady. Grain lower. Rice fair. Peanuts steady. Weather cold.....Charleston, S. C.: Cotton receipts very heavy during the week; a good tone to the market.....Savannah, Ga.: The decline in the cotton market at New York and Liverpool caused a depression here; but factors think this only a temporary lull, as the scarcity of cotton must stiffen prices. The shortness of the crop is more felt in business circles than was expected.....Augusta, Ga.: The cry of short crops and hard times has produced a general feeling of distrust among the merchants. All cotton manufactories here are paying regular dividends of 8@12 per cent. The stock of some of them is $70@$75 above par. Nearly all the $1,000,000 capital of the King Cotton Factory has been subscribed, and the building of the factory is now almost a certainty. Cotton picking about over for the season..... New Orleans, La.: Cotton quiet at a slight decline. Sugar and molasses receipts increasing but prices show a downward tendency on account of the inferior quality. Weather cold and favorable for sugar making..... The Texas sheep raisers have experienced great difficulty in shearing, on account of heavy and continued rain storms. Whole flocks are ranging about in a half-sheared condition..... .....Memphis, Tenn.: Cotton receipts larger than last week; prices better. Factors and jobbers are collecting closely and crediting prudently. This bespeaks better results for next year.....Nashville, Tenn.: Receipts and sales of cattle very active: good grades are high. Provisions for the week quiet. Little or no change in grain, flour or produce markets from last week. Packers are killing largely.

Mr. George Drake, 48 Oak Street, Indianapolis, Ind., suffered terribly with 'water' rheumatism. He used St. Jacobs Oil and was entirely cured.—N. Y. Spirit of the Times.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is enough. Price 25 and 60 cents per box.

If You are Sick

Kidney-Wort will save you more doctor's bills than any other medicine known. Acting with specific energy on the kidneys and liver it cures the worst diseases caused by their derangement. Use it at once.—Union.

Let the poor sufferers from female complaints take courage and rejoice that a painless remedy has been found. We refer to Lydia E. Pinkham's Vegetable Compound. It is prepared at 233 Western Avenue, Lynn, Mass. Send to Mrs. Pinkham for pamphlets.

The People's World-Wide Verdict.

BURNETT'S COCOAINE has been sold in every civilized country, and the public have rendered the verdict that it is the *cheapest and best Hair Dressing in the world.*

BURNETT'S FLAVORING EXTRACTS are invariably acknowledged the purest and the best.

The Markets.

CHICAGO.—WHEAT unsettled, but generally lower; No. 2 Chicago Spring, $1.24½@1.24¾ cash; $1.22½ November; $1.24½@1.24⅝ December; $1.25½@1.25⅝ January; $1.26⅛@1.26⅝ February; No. 3 do.; $1.11½; rejected, 85@90c. CORN fairly active and a shade higher at 58⅝c. cash and November and bid December; 59c. January; 64c⅛. May; rejected, 57¼c. OATS unsettled and lower at 45¼c. cash and November; 44⅝c. December; 43¼c. January and February; 45⅜c. May. RYE easier at 97½c. BARLEY easier at 1.04½. FLAXSEED scarce and firm at $1.47. PORK moderately active at $16.25 for old; $16.85 for new cash; $16.10@16.85 November and December; $17.20@17.22½ January; $17.42½@17.45 February. LARD fairly active and a shade higher at 11.05c. cash; 11.07½@11.10c. December; 11.22½@11.25c. January; 11.37½@11.40c. February. Bulkmeats fairly active and a shade higher; shoulders, 6.35c.; short-rib, 8.90c.; short clear, 9.15c. CATTLE—Market steady and fairly active. Exports, $6@6.50; good to choice shipping, $5.30@5.75; common to fair, $4@5; mixed butchers' very plenty; all poor kinds weak; common to fair, $2@2.50; medium to good, $2.75@3.50; choice, $3.75@4; stockers and feeders plenty and lows; poor to choice, $2.40@3.75; milkers and springers, $25@60; Texans, $3@4; half breeds and native rangers, $4@4.90. SHEEP—Common to medium, $3.30@3.75; good to choice, $4@4.50; selected wethers, $4.75@5.25.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Nov. 26, 1881.

BEANS AND PEAS.—Marrow beans are steady, with prices quoted very full. Mediums quite active at the easier rate. Fancy beans plenty and weak. German beans have sold at $2.75 for prime. Green peas rather steadier for bbls. at $1.65@1.70; choice in store, $1.75; bag lots 10c. under bbls.

Marrow beans, prime, $3.45@3.50; fair to good, $3.25@3.35; medium, prime, $3.05; fair to good, $2.70@2.80; pea, choice, $2.93@3.25; white kidney, $3.30@3.45; red kidney, choice, $2.85@2.90; other, $2.50@2.75; black or turtle soup, $1.80@1.90.

Receipts of beans for the week, 10,200 bush.
Exports do. 317 bbls.

BEESWAX.—Dull at 21@22c. A good many substitutes have come forward of late years, and the market is not so certain as used to be. Exports little more than one-half for this date last year.

BUTTER.—A few cold days have enlarged the attendance of buyers, and as good to fine table grades are not in liberal supply those grades are firm, while extra marks of creamery and selections of half tubs are marked up a cent or so. Certain buyers have been holding off for a favorable turn, but as they begin to be in want of stock, they seem inclined to accept the situation, and a better wholesale tone prevails than has been noted for some time back. Single package buying for home Winter use is now a feature, but not so prominent as in former cheaper seasons. This run is generally for strictly first-class stock. When fine-quality half tubs are plenty, sellers like to furnish this line of trade, especially as 2 or 3c. can be added on to line prices and readily obtained. Most dealers, however, are rather forced to hold their few invoices of high-grade for customers who appear more than once or twice a year. As before, light supplies of Western table grades bolster up all desirable parcels of State; by table grades we mean qualities above Winter styles of export lots. Plenty of the latter arrive and have to be put into the secluded companionship of an old, unsold surplus.

Creamery, extra choice, 40c.; good to prime, 35@38c.; fair to good, 30@35c.; poor, 20@25c.; June, 29@29c.; State half tubs and pails, ch. fresh, 31@35c.; good to prime, 31@33c.; fair to good, 28@31c.; Welsh tubs, choice fresh, 31@34c.; good to prime, 29@31c.; fair to good, 25@29c.; poor to fair, 18@25c.; State dairies, firkins and tubs, choice, 32c.; good to prime, 29@30c.; fair to good, 27@29c.; firkins, dairies, choice, 30c.; good to prime, 28@29c.; fair to good, 21@27c.; poor to fair, 18@24c.; Western imitation creamery, 27@35c.; Western dairy, fresh, choice, 30@32c.; good to prime, 25@28c.; fair to good, 18@25c.; Western factory, late made, choice, 20@25c.; late made, good, 16@18c.; late made, 14½@15c.; Iowa, fine June, 16½@17c.; Ohio and Ind., June, 15½@16½c.; June, fair to good, 15@15½c.; factory, very poor, 13@14c.; roll butter, good to prime, 23@25c.

COTTON.—The market opened with a low tendency, but latterly strong Liverpool prices have brought forward exporters, and home spinners have purchased to a liberal extent. Crop reports still tend to stiffen quotations.

CURRENT PRICES FOR SPOT COTTON.

Quotations based on American standard of classification and on cotton in store, running in quality not more than half a grade above or below the grade quoted.

FREE TO JANUARY 1ST.

The Fair Number of the **Rural New-Yorker** *(44 pages), which contains a full description of our* **Free Seed Distribution for 1882,** *also an account of the* **$2.000 worth of Presents** *offered to those subscribers who produce the best yields, and our Premium Lists for all who interest themselves in securing subscribers for the Rural New-Yorker, will be sent free to all applicants. Our new Posters are also ready and will be sent free to all. Our friends and agents are reminded that the present is, on many accounts, a more favorable season for securing subscriptions, or the promise of them, than later, when competition is keener.*

The Rural New-Yorker is for the North, South, East and West.

It knows no sectional prejudices. Everybody who is interested in a garden, vineyard, orchard or farm; in new plants, in farm or garden implements; everybody who is interested in Horticulture, and seeking through such means to increase the happiness of life and home, should subscribe. The Rural New-Yorker is the earnest friend of all who love nature and her works.

The first journal to have established an Experimental Farm conducted in the interests of its readers.

The Rural New-Yorker is acknowledged, by those who should know, to have worked a new era in rural journalism. Five Hundred Illustrations from nature annually; the best writers; the best draughtsmen. Ask those who know.

Horses, Cattle, Sheep, Swine, Poultry,

Milk, Butter, Cheese, Diseases of Animals, Bees, Injurious Insects, Grain, Grass, Small Fruits, all Ornamental and Useful Trees and Shrubs are among the prominent subjects treated in its columns.

No matter where you live, you cannot afford to be without the Rural New-Yorker. It is the progressive, aggressive, alert, original, conscientious rural journal of the age. Thousands of testimonials to this effect. Our **Everywhere Reports** are invaluable to the Farmer and Horticulturist. They have proven of great value to them in determining the best time to **Buy** or **Sell**. Our market reports are corrected by a special reporter up to the time of going to press. Our agricultural and general news embraces everything of interest to intelligent readers. Correspondents everywhere. Thirty-second year of its age: Fifth year under its present management. Try it—*Try it*—TRY IT—for one year. It will cost you but $2.00. It may save you hundreds. Try it as a measure of Economy.

The objects of the Experiment Farm of the Rural New-Yorker are to test all kinds of new seeds and to present the results to our readers; to produce new varieties of grain by cross-breeding; to test new farm implements and methods of culture, with a view to producing the greatest yields at the smallest cost; to disseminate seeds of varieties which, from our own tests, have proven of unusual worth among our readers, without cost to them, and thus advance the agricultural interests of the whole country.

The Rural New-Yorker has no personal interests to subserve. It has neither seeds nor plants nor books nor anything whatever to sell. It is conducted purely in the interests of Agriculture and Horticulture and Stock-Keeping. Its tests of plants, seeds, manures, implements, are made regardless of individual interests or those of advertising patrons. It holds the interests of LAND CULTURE as above all others, and its aim is to benefit all who occupy themselves in the culture of land and its attendant industries, either for pleasure, profit or support.

The Rural New-Yorker earnestly labors to instruct the stockman and breeder; to introduce new fruits of improved quality; to make known the beneficent influences of the garden and of trees and shrubs about the home; to increase the comforts, refinement, health, and the general welfare of all who own and cultivate land. It tests all new vegetables, and makes known their value. It tells how to raise them in the greatest perfection. Shrubs and trees, flowers, plants of every description, the methods of cultivation to suit the varied and ever-changing conditions which arise, constitute prominent departments.

The insect enemies which infest our field crops, our fruit trees and small fruits as well as vegetables and flowers, and which seem to be rapidly increasing, are subjects of our most careful consideration, and entomology in general is treated in our columns by the ablest specialists in the country.

The Progress and Development of American Horticulture and Agriculture

are always our earnest endeavor. Such efforts as these have brought the Rural New-Yorker to the position it now occupies. The Price of the **Rural New-Yorker is reduced to $2.00 a Year,** payable *invariably in advance.* We have now no club or second price. It is alike to all. ☞ Send for the Fair Number which explains all.

Address RURAL NEW-YORKER, 34 Park Row, New York.

CHEESE.—Only a light movement can be reported. Shippers purchase small lots of pure State only on orders and lower grades of stock scarcely receive attention. The market closes a fraction lower than for last week.

State fact'y, fine, Sept, 12½c.; good to prime, 10½@11½c.; fair to good, 9½@10½c.; poor to fair, 8@9c.; Ohio factory, fine mild, 11½@12c.; good to prime, 10@11c.; fair to good, 8@10c.; poor to fair, 6½@8c.; creamery, partly skimmed, choice, 8½@9c.; poor to good, 4@6c.; fully skimmed, 2½@3c.

Receipts for the week, 56,261 bxs.

Exports do. 15,479 do., part of which are Canadian.

Liverpool quotations, 55s. for Summer and 63s. for late.

Steam to Liverpool, 12s. 6d.@17s.

EGGS.—Receipts for the week, 12,235 bbls.; do. last week, 10,500 do. The market holds strong with the demand centered upon prime fresh marks. Good held stock that does not count loss too heavily has a fair trade. There is only a fair stock in store and with high prices at the West dealers look for good prices, especially if the weather hardens.

New J'y L., L. and near by 33c.; Pa. and State fresh 30c.. seconds, 29½@29c.; Western fresh, 28@28½c.; Western and Canadian held 27c.; poor, 24@26c.; limed State 21½@23½c.; W. and Canadian 20@22c.

FLOUR.—Prices have not shown much variation compared with last week. There has been a fair demand for shipping and local use brands, the latter closing with some solidity mainly for the reason ascribed last week. A reduction of milling at the West owing to the difficulty of obtaining suitable sort of wheat at compensating figures.

No. 2, $4.25@4.45; State and Western, superfine, $4.25@5.25; city mills, XX, $6.10@7.35; Spring wheat, extra, $5.25@6.50; Spring XX and XXX, $6.60@6.75; patents $6.50@8.50; Ohio round hoop shipping, $5.40@5.90; trade brands, $6.00@6.50; St. Louis extra, $5.50@6.00; do. double extra, $6.20@6.50; do. family, $6.65@7.00; Southern extra shipping, $6.00@6.40; do. XX and family, $6.50@7.25. Rye flour, superfine, $5.00@5.35; buckwheat flour ₱ 100 ℔s. $3.80@4.00. Corn-meal, Brandywine, ₱ bbl. $3.70@3.80; do. Western, $3.50@3.70. Wheat feed, 40 ℔ ₱ ton, $18.50@19.50; 100 ℔ ₱ ton, $19@20; 100 ℔ ₱ ton, $22@23; rye feed ₱ ton, $23.

This is one of the scarcest seasons for buckwheat ever known.

Receipts of flour for the week, 102,700 bbls.; corn-meal 1,630 do.

Exports of flour for the week, 33,658 bbls.; corn-meal 1,975 do.

FRESH FRUITS.—Exports of apples 6,000 bbls. The holiday sent a good many apples into use and the market is firm for fine red. Other fruits moderately firm at quotations.

Apples, Spitzenburg, fancy, ₱ bbl. $3.50@3.75; Greening and Baldwin, do. $3.37@3.50; Baldwin, Greening and Spitzenburg, fair to prime, $2.75@3.25; N. Spy, State, $2.50@2.75; mixed lots, State, prime, $2.75@3.25; do. fair to good, $2.25@2.75; seconds, $1.75@2. Pears, Boston, bush. boxes, fancy, $3.00@4.00; poor to good, $1@2.50; Lawrence, State, ₱ bbl. $2.50@4.50; Vicar of Wakefield, $2.50@3.50; cooking, $2@3. Grapes, Catawba State, case of 18 3-℔. bxs, $4; bskts, ₱ ℔, 8c.; Isabella, State bskts, 3@4c. Florida oranges, half-bbl. bxs, choice, $10@4.50; good to prime, $5@8.50; inferior, $2@2.50; thirds, choice, $2.75@3; fair to prime, $2.25@2.50; inferior, $1.50@1.75. Cranberries, Cape Cod, fancy, large, ₱ bbl. $10@11; good to choice, $8.50@9.50; poor to fair $5@7; frosted $3@3.50; ₱ crate, $2.50@3.50; New Jersey fancy, $2.75@3; fair to prime, $2.25@2.62; poor to fair, $1.75@2.25; frosted, 50c.@$1.

Peanuts, Va., hand picked, ₱ ℔, 6¾@6¾c.; fancy, 6¾c.; extra prime, 6¼c.; good to prime, 5¾@6c. shelled, 5@5¾c.; pecan nuts, 9@11c.; hickory, shell-bark, Northern, ₱ bu. $1.00@1.25; Western, $1.00; bull, 40@50c.; black walnuts, 50@75c.; chestnuts, Northern, $4@5.

GRAIN.—Wheat is not showing heavily at the main points of collection. The market opened with a low drift, which brought in some additional export orders and at the close there is a stronger tone to prices as quoted and a wholesome volume of spot business. Corn has gone out freely and prices hold up well. Oats have been good property all the week and both sides of the market indicate confidence. Buckwheat scarce and firmer. Barley and rye dull, consumers begin to make lower bids.

Wheat, Spring, $1.25@1.38; Spring No. 2, $1.35@1.37; red Winter No. 2, $1.40@1.40½; red Winter, $1.30@1.43; white Western and State, $1.32@1.41. Rye, 95c.@1.03; Oats, white No. 1, 53½c.; No. 2, 51½c.; No. 3, 49½c., mixed, No. 1, 49½c.; No. 2, 48½@49c.; No. 3, 45@47½c; Corn, Western mixed, 68@68c.; No. 2, 67@67¾c.; yellow, 68@72c.; white, 70@73c. Barley, Canada No. 1, $1.12@1.15; do. bright, $1.15@1.17; State 4-rowed, $1.00@1.05; 2-rowed 90. Buckwheat, 91@96c.

Receipts for the week, wheat, 635,700 bush.; corn, 914,000 do.; oats, 178,950 do.; rye, 159,750 do.; malt, 35,000 do.; barley, 283,800 do.

Exports for the week, wheat, 562,900 bush. corn, 685,675 do.; oats, 4,850 do.

HAY AND STRAW.—Exports for week 7,464 bales, do. since Jan. '81 71,350 do.; same time '80, 100,675 do. Supplies of hay are large and only exceptionally fine retailing make the extreme.

Prime Timothy hay, ₱ 100 ℔s., $1.05@1.10; medium Timothy, 80@85c.; shipping grades, 65@70c.; clover mixed, 70@90c.; all, 60@65c.; Straw, long rye, 75@80c.; short rye, 55@60c. oat and wheat straw, 40@50c.

HOPS.—The Producers' Price Current says: "Business is very light. An arrival of 300 bales (300 ℔ each) German, or rather Polish, hops, is exciting remark.

Crop of 1881, choice, 28@29c.; good to prime, 25@27c.; fair to good 22@25c.; eastern, 18@27c.; 1880, good to prime, 18@22c.; poor to fair, 10@15c.; 1879 fair to prime, 14@15c.

Receipts for the week, 770 bales,
Exports for the week, 869 do.
Receipts since Jan. '81, 88,857; do. last year, 41,964.
Exports corresponding periods, 34,279, against 17,650.

MILK.—The market has done well for commission lots averaging $2.57 per can of 40 quarts. Milk has sold out very clean every day.

POULTRY AND GAME.—The display of turkeys was remarkably common for the festival purposes of the week and the offering was comparatively light. Wednesday, the closing day for wholesaling, was stormy, but dealers were generally closed out by noon. The weather has not been encouraging for much enterprise on the part of poultry raisers, while short, high corn also checked fattening. The market being clean after Thanksgiving is in good shape for future supplies, and, all things considered, this is better than a glut of detained stock, which has often proved disastrous to shippers.

Turkeys, Phila. pr, 16@18c.; J'y 15½@16½c; State and W'n pr, 14½@14½c.; f'r to g'd, 13@14c. Chickens, Phila. prime, 14@15c.; Bucks Co. do. 13@14c.; Jersey, do, 12@13c.; State and Western, do. 11½@12c. Fowls, Phila. prime, 13c.; Bucks Co. 11@12c.; New Jersey, do. 11@12c.; State and Western, do. 10@11c.; fair to good, 9@10c.; inferior, 8@10c. Ducks, Phila. prime, ₱ ℔, 15@16c.; Jersey and Bucks Co. 14@15c.; State and Western, 13@14c; fair to good, 10@12c. Geese, Phila. dry-picked, prime, 12@13c.; Jersey and Bucks Co. 11½@12c.; State and West'n, 10@11c.; fair to good, 9@10c. Squabs, white, ₱ doz. $2.50@2.75; dark, $1.75.

Cooped stock depends upon merely a chance sale while dressed is in season and arrives regularly.

Chickens and fowls, J'y, State and Penn. ₱ ℔ 9@10c.; Western and Southern, 8@9c. Roosters, old, 5c. Turkeys, Jersey and Penn. 10@12c.; Western, 9@11c. Ducks, Jersey, extra-large, ₱ pair, $1@1.25; Jersey, New York and Penn. 60@75c.; Western and Southern, 45@50c. Geese, Jersey, $1.50@2; N. Y. and Penn, $1.25@1.62; Western mixed, $1@1.37. Pigeons, 30@40c.

Thanksgiving sales gave prices for game considerable backbone and the market closes with a very good tone. Wild ducks are unusually popular this season.

Quail, choice, ₱ doz. $2.50@3; inferior, $1.50@2; grouse, choice, ₱ pair $1.00@1.12; soft, 65@75c.; partridges, State and W'n, pr. $1.12@1.25; Eastern & Minn, 90c.@$1; soft, 65@75c.; woodcock, choice, 75@80c.; inferior, 60@65c.; rabbits, 40@45c.; venison, Minn. short saddles, ₱ ℔. 16c.; State & Wn, 14@15c.; whole deer, 11@12½c.

Canvasback duck, Havre de Grace and Western, $3 Norfolk, $2.50; redhead $1@1.25 for Western and 75c. for Norfolk; the Norfolk lots are generally in bad order and some lots sold at 10c. per pair; mallard at 50@70c. for Western, the inside rate for Missouri; teal at 50@60c; and common, 30c., all per pair. Rabbits are scarce. Venison selling well, short saddles occasionally exceeding price.

PROVISIONS.—A very satisfactory turn has attended the market; exporters have bought freely in lard and bacon; when the latter hog-product moves steadily a good point has been obtained for the pork trade generally.

Pork, prime mess, ₱ bbl. $16.75@17; extra prime, ₱ bbl. $14.50@14.75; Western mess new, $17.25@17.50. Lard, steam Western, ₱ 100 ℔s., $11.25@11.30; prime city, $11.15@11.20. Hams, smoked city, ₱ ℔. 12½@13c.; pickled Western and city, 10@10½c.; Shoulders, smoked city, 8½@8½c; pickled, 7½@7½c. Rib bellies, pickled, 9@9½c. Bacon, long clear Western, 9¼@9½c. Beef, Western mess, ₱ bbl. $12; packet, $14; India mess, ₱ tcs. $23@25. Beef hams, ₱ bbl., $19.50@20.50.

Receipts for the week—Beef, bbls. and tcs. 1,452; pork, bbls 3,835; cut-meats, pkgs 28,488; lard, do. 16,426.

Exports for the week—Beef, bbls. and tcs. 2,308; pork bbls. 4,256; cut-meats, ℔s. 9,965,211; lard do. 5,579,802.

VEGETABLES.—Exports of potatoes for week 20,012 bbls. Receipts have moderated and prices are growing firmer. The crop shows an unusual percentage of small sizes; these are neglected for best even at the difference in prices. Sweets steady and firm.

Potatoes—Early Rose, Eastern, ₱ d.-h. bbl., $2.50@3; State, $2.62@2.87; bulk, ₱ bbl. $2.50@2.75; Prolific, Eastern, d.-h. $2.50@2.75; Snowflake, State, $2.50@2.87; bulk, ₱ bbl. $2.25@2.75; Burbank, d.-h. $2.62@2.87; bulk, ₱ bbl. $2.62@2.87; Peachblow, ₱ d.-h. bbl., $2.75@3.00; Peerless, bulk, ₱ bbl., $2.25@2.37; Mercer Eastern, ₱ d.-h. bbl. $2.25; sweet potatoes, Va. yellow, ₱ bbl. $3.75@4.00; Del. River, $1@4.50; Jersey, $3.75@4.00; inferior, $3@3.50.

Onions in good demand. Celery extremely scarce and high. Market almost bare of fine heads of cabbage. Pumpkins scarce; marrow squash have thereby a good market.

Onions, white bulk, ₱ bbl. $3.50@4; yellow, $2.25@2.50; red, east, $2.25@2.50; red Chester, $2@2.37; squash, Marrow, ₱ bbl., $2.75@3.00; Hubbard, $3.00@3.25; cabbage, ₱ 100, $8@16; beets, L. I. ₱ bbl. $2.00@2.25; carrots, $1.25; turnips, Russia, L. I. $1.75@2; Canada, $1.50; cauliflower, fancy, $5@7; average quality, $1.75@2.50; inferior, 50c@$1; celery, ₱ doz., $2.00@2.25.

WOOL.—Operations in this staple are largely connected with Eastern buyers, and as Eastern buyers are too devoted to their Thanksgiving traditions and celebration to give earnest attention to commerce, the market is in its customary lull of the last week of November. Prices nominally up to full former rates.

LIVE STOCK MARKETS.

NEW YORK, Saturday, Nov. 26, 1881.

BEEVES.—Receipts for the week, 13,192 head: do. last week, 13,848 do. Clear, cold weather stimulated the early demand and butchers took hold pretty well early in the day; all the light common cattle were picked up at a fraction advance from yesterday and ½c. higher than on Wednesday. Medium and good grades were slow and show no improvement in prices. A car of very poor Tennessee oxen and bulls sold down to 3c. live weight, and a load of light Virginia cattle at 3¾c, but the range for common to prime steers was from 5¼c. to dress 55 ℔s to 11¼c. to dress 57 ℔s. Exporters operate only moderately.

MILCH COWS.—There is an active demand for fine cows suitable for family use. Extras would bring $80@85 per head; common to prime State stock was quoted during the week at $40@75 with sales.

SHEEP AND LAMBS.—Receipts for the week, 33,123 head; do. last week, 37,786 do. Market active and prices a trifle higher all round. From 4 to 5¾c. represents the range for sheep, and lambs sold from 5¼ to 6½c.—two cars of choice Canada lambs at latter prices. Western advices do not indicate a very heavy supply for next Monday, and the prospects are pretty good, particularly if the weather holds cool.

SWINE.—Receipts for the week, 37,134 head; do. last week, 38,700 do. Seasonable weather produces a better feeling in live both here and at the West; corn-fed quoted $5.75@6.12 ₱ 100.

Hogs, New Jersey dressed, light, 8¾@9¼c.; medium, 8¾@8¾c.; heavy, 7¾@7¾c.; city dressed, 7½@8c. Pork tenderloins, 11½@12½c.

VEAL CALVES.—Supplies continue light and prices favor producers and sellers. The market has had a long run of steadiness.

Hog-dressed country, choice, 13½@14c; fair to good, 12@13c; grass, 5@6c; fed 6@7c; live calves, N. J. prime to choice, 9½c.; do. State, 9@9½c.; fair to good, 8@9c.; poor to fair, 6@8c.; Mount Hollys, 6@10c.; live calves, fed, 4@4½c; grass, 3@3½c.

REGISTERED JERSEY BUTTER BULLS at farmers' prices. Pansy, Alphea and other strains—Seven bulls, from one month to three years old (for sale at very low prices, on account of being overstocked,) running directly to Pansy, Pansy 6th, Pansy 7th, Alphea, Jupiter, Mercury, Trusty, Myra 3d, Trudie, Edith 2d, Lenox, St. Elo, Rujah, Albert, Litchfield, Norton's Roses, Marius, Lady Maro and Splendid. For further particulars and prices, apply to RICHARD GOODMAN, Jr., Yokun Farm, Lenox, Mass.

Terms for 1881.

FARMING FOR BOYS AND GIRLS. No. 40.

HENRY STEWART.

Soiling Cattle.

THERE are some questions in the art of farming which are easily settled by simply reasoning about them ; and that regarding soiling cattle is one of these. There are but two ways of feeding cattle, or pasturing, or permitting them to take their food from the ground as it is growing ; and gathering the food crops and feeding them to the cattle in barn, stable or the yard. It is very easy to perceive, that, if horses, cows, pigs, sheep and poultry were allowed to run in the fields and eat the grass corn, oats, beets, turnips or potatoes, that were grown for them there would be an enormous waste, and the animals would have too much food at one time, and none at another, and would simply starve in the Winter. To avoid this waste and this starvation we gather and house the crops, and feed them to the stock in such quantities as are needful ; using our reason, instead of leaving them to their own instincts, which is very imperfect as compared with human reason.

The same principle applies to some extent to the method of soiling, which is the practice of growing crops to be cut green and fed to cattle in the Summer, in barns or stables, or in racks in the yards. If a farmer grows corn or oats, or peas for his cows, he dare not turn them into the fields to eat these crops, because the cows would trample down and destroy much more than they would eat. So he is forced to cut these crops and feed them to the cows in such a way as to prevent them from wasting the food. This is soiling. And it is one of the most economical ways of feeding animals.

Soiling is practiced either partially or completely, as may be found the most convenient for the farmer. A dairyman who has grass lands suitable for pasture, soils his cows, when the grass begins to fail in the hot, dry Summer months. He sows oats, and plants corn, and when the grass begins to dry up and becomes hard, he cuts and feeds the oats and corn. This is partial soiling. When a dairyman or farmer has no pasture, and wishes to keep cows for milk or for butter, he must soil the cows completely. He begins in the Fall to prepare for it by sowing rye which he cuts in April and May and feeds to the cows. He has a piece of clover or grass which is in full growth when the rye begins to get hard and nearly ripe. Then he cuts the clover and grass and feeds these, and cuts down the rest of the rye and cures it for feed in the Winter. Very early in the Spring, as soon as the ground can be made ready, some oats are sown, and in a few days some more are sown, and this is repeated every few days, until it is time to plant corn, early in May. When the clover and grass are used up, the first of the oats are ready, and the oats are fed until they begin to get ripe in July, when the first early corn is ready to cut. The oats are then cut and cured and put away for the Winter. A piece of ground is planted with beets or mangels in May, and another piece in June where the rye was taken off. The rest of the rye ground is planted with corn, and as the oats are cut, corn is planted on that ground too. For the first corn an early kind is planted, and sweet corn is preferred for this use, because it is much liked by the cows and is eaten without any waste. The corn is fed from the time it is first ready until it begins to ripen, when the second cutting of clover and grass is ready, or the first sown beets or mangels. When it is too late to plant corn on the last oat ground, millet or Hungarian grass is sown and this can be cut in about six weeks, either for feeding green or to be cured for the Winter. In the Winter the beets and mangels supply fresh food, and the cured crops dry fodder. In this way the cows may be fed all the year round without leaving the stables or yards, or a small lot, where they can take some exercise and get what water they need; and it is quite easy for one cow to be fed all the year from one acre of ground, while 10 acres are needed under the usual system.

The only question which needs to be considered, is, whether it is better to grow grass and let the cows pasture it, and take 10 acres for each cow; or to grow soiling crops and do the extra work required in feeding the cows and so make 10 acres keep 10 cows. There are farms where land is cheap and cannot be plowed and produces grass plentifully. On such farms pasturing must be practiced and will pay the best; but there are other farms where land is dear and does not produce good grass, but does produce rye, oats, corn and roots to perfection, especially when there is plenty of manure to put on the fields. On such farms soiling can be practiced with advantage. It is quite easy to see that a very large quantity of manure will be made, where cows are soiled, and this, too, is a point which is very important in considering this subject.

WHAT TO DO.

UNCLE MARK.

AN old fable runs somewhat as follows: A little rain drop during a shower one day crept under the cornice and very demurely watched its fellows as they went laughing and dancing along the gutter.

"Come and join us" said a gay fellow as he went leaping past.

"Can't do any good," the lonely drop replied, "besides there are enough of you without me and I shall get along quite as well, here by myself." Poor, unsuspecting little fellow! It was not long before the bright sun came out, and he was gone.

Well, we are all but drops in the great shower of human life, and sometimes, in our younger days, we think we are such small drops that we can do no good. But, can we not? If we begin right, we may.

Now how shall my young readers begin, if they have not already, to do something so that they may *not* be like the idle drop, unable and unwilling to join the great tide ever flowing; how shall they *not* be left behind in the race for all that is noble, true and good; how shall those who have decided to make farming their life-work, in it attain the best success?

The farmer can profit by education as well as anybody, and the young man who obtains the best education within his reach, has taken one grand step. A great many of our farmer boys cannot attend school in the Summer owing to pressure of work, but in the Winter season they have ample opportunity to study and improve their minds and this opportunity they should accept. First of all, then, get a good, sound, common school education, and if you have a desire, and your parents consent, to go still farther, do it!

Then, in addition to your studies this Winter procure some good books and papers on horticulture and agriculture and make them your companions during the coming long Winter evenings instead of the trashy literature too often found in the hands of the young. In this way you may learn something of the theories and practice of others, and be laying a good foundation for future work. The amount of information gained by a course of reading through the Winter, in connection with occasional conversations with those who have experience in farming, will be greater than you now suppose.

When Spring again opens and the time arrives for making preparation for next year's crops, keep both eyes open; put into practice something of which you have read; make Nature your instructor, and you may again be surprised at what you can do and how well you can do it. In this way you will not be "an idle, lonely drop" in the great tide of agricultural life, but as you grow older and become more experienced, you will hear others say "come and join us" in our attempts to promote each others', and our country's, welfare and you will not say like the little drop in the fable, "Can't do any good;" your education training and experience will place you where you cannot truly say it for a your influence must be felt.

LETTERS FROM THE COUSINS.

UNCLE MARK: We know your word is law, and not liking to have our names stricken from the list, will make the best effort we are able to. We had no success with the seeds sent out by you, but were more fortunate with the general distribution. The dianthus is a great addition to our flower garden, every seed producing different colored flowers. The pinks, which the carnations proved to be, are pretty, but one variety of large fringed flowers are especially beautiful. Cousins, imagine you are riding through a country where the barns are covered with prairie hay, the houses are generally a story-and-a-half high, about 16 feet wide and 24 feet long, without porches, and unpainted. There is usually a grove around them, but very seldom an orchard. The garden is not even fenced off, so if we have any at all we must scare hogs and chickens from the time it is planted till we gather the produce. We seldom have any help from the men after they plow it, for they consider working in a garden a waste of time, and only women and children's work. A corn-field of large area is the hight of their ambition. This may give a little idea of some of the homes on this Western prairie. ROSY AND ANDREW BENTON.

Grundy Center, Iowa.

DEAR UNCLE MARK:—I am now going to tell you how the seed that you sent grew. The oats, sorghum, asparagus and the White Elephant all grew nicely. There will be about a peck of oats after they are threshed. The sorghum ripened some seed. The White Elephant we planted in four hills. There were 25 potatoes dug, weighing 13 pounds; six of them weighed over a pound each. There were quite a number of "babies." The bugs ate two hills off after they got to growing nicely, but they grew again. If there are any cousins who had luck with the Japan Red Bud, I wish they would send me some seed, as mine did not grow. I planted them in a tub with my pinks, but they did not come out. I would like to have Alma Allen write to me. I see in a RURAL a while ago that anyone could become a member by sending their name and address, so please accept me as a member and I will try and do better with the next seed. I will have to close or this will reach the waste basket. Your niece,

Dexter, N. Y. ELLA PATRICK.

DEAR UNCLE MARK: I am a little boy nine years old, and would like to be enrolled as a member of the Horticultural Club. My papa is a farmer and takes the RURAL, which we all like very much. I love to read the letters from the cousins, and have wanted to join the Club for a long time, but have waited to tell you about my flowers and also about the seed you sent my papa last Spring. The White Elephant Potatoes were beauties. The potato you sent weighed four ounces; papa dug 42½ pounds, several of the tubers weighing over one pound each. I have a little plot of land papa gave me last year, where I cultivate flowers and vegetables. I have roses, dahlias, geraniums, asters, petunias, poppies and lilies. Mamma gave me the pinks you sent; they grew well and were all very double. I have eight kinds. Ought I to remove them to the cellar this Winter. [No; cover them a little.—U. M.] I also have some very nice Surprise Melons, and citron, pop-corn and beans in my little garden. I have no little brother or sister, but I have my flowers to amuse me. Mamma has a good many greenhouse plants. She has given me a few slips, so I shall have some flowers this Winter, and hope by reading the RURAL to learn more about cultivating them. Your nephew,

Milford, N. Y. ARTHUR CUMMINGS.

UNCLE MARK:—Pa subscribed for your paper last February and is well pleased with it; he takes five other papers, but says yours is the best of all. I and little brother Tommy wish to have our names enrolled in the Rural Horticultural Club. I am 13 and he is five years old. I help pa on the farm during the day and study my lessons at night. I can plough, harrow, hoe, pick cotton, pull peanuts and make myself generally useful. Pa says it is "root, hog, or die." I prefer rooting to dying. Pa intends giving us a plot of land to cultivate next year. I have three-fourths of an acre in peanuts and cotton this year, but owing to dry weather they made short crops. Peanuts in this section are about one-half a crop, cotton, two-thirds and corn three-fourths of an average crop. JOHN R. PEEBLES.

Disputanta, Va.

DEAR UNCLE MARK:—May I join your large band of Cousins? Pa has taken the RURAL ever so long. He took it when it was "Moore's RURAL NEW-YORKER." He received the seeds sent him, and gave me the dianthus, picotees and carnation seeds. All that I planted in the house and then transplanted grew nicely and are blooming. One bunch of dianthus had about 35 blossoms on it at once; another of picotees had about 24 blossoms. A question: Do we (in Iowa) have to take them out of the ground in Winter, or leave them in and cover them up? I should not like to lose them. I never had any flowers before this year, but I had splendid luck and hope to have better next year. If I do I will write and tell you of it. "COUNTRY GIRL."

Springville, Iowa.

[Your plants will live out-of-doors this Winter, if covered.—U. M.]

DEAR UNCLE MARK:—I shall be glad to join the Horticultural club. My father intends to take the RURAL, and the Detroit Free Press next year. We take the RURAL this year, and like it very much. It was almost too late in the season before we thought much about the seed that was sent free to subscribers. My father likes the looks of the Rural Dent Corn very much ; but he thinks we live too far north for it to mature. Do you not think it would be nice to have the photographs of all your nephews and nieces? [Most certainly I do. U. M.] I am willing to give you mine if the rest of my cousins are. I would like to know what you or my cousins think of it. Your niece. LIZZIE MILLER.

Frankfort, Ont.

New Members of the Club for Week Ending Nov. 26.

It will also knit a great variety of fancy work for which there is always a ready market. Send for circular and terms to the **Twombly Knitting Machine Co., 163 Tremont Street, Boston, Mass.**

PERSONALS.

Henry James, Jr., has returned from Europe to get acquainted with his own country.

The prince of Wales has just passed his fortieth birthday. All his tradesmen—about 250 persons—dined together in London to celebrate the occasion.

The late Baron James de Rothschild, of Paris, was educated in the law and was a connoisseur of mediæval literature and art. He was but 37 at the time of his death, which occurred from the bursting of an aneurism said to have been caused by vexation at the loss of 85,000,000 francs in three weeks by speculating on the Paris *Bourse*.

New Publications.

BEAUTIES OF SACRED SONG.

This splendid new collection of the best Sacred Songs of the day, will be a most valuable addition to our libraries, and is full of gems.

Among the authors we notice the names of Gounod, Sullivan, Marzials, Abt, Thomas, Smart and Pinsuti, and there are more than 30 others of good repute. Gounod's "Green Hill far away;" Faure's "Palm Branches;" and Abt's "Above the Stars" indicate the high character of the compositions, which are 58 in number.

Price $2.00 Boards. $2,50 Cloth.

THE BANNER OF VICTORY

This inspiring title belongs to a new SONG BOOK for SUNDAY SCHOOLS, just out. It is by Abbey & Munger, who made a decided success in their last book, "WHITE ROBES," and who in this new compilation furnish a number of the sweetest melodies ever placed in a collection of the kind. 160 pages, and about as many songs, many of them adapted to the Prayer Meeting, as well as to the Sunday School. Price 35 cents.

TRADE KIDNEY-WORT MARK

THE ONLY MEDICINE

IN EITHER LIQUID OR DRY FORM

That Acts at the same time on

THE LIVER, THE BOWELS, AND THE KIDNEYS.

WHY ARE WE SICK?

Because we allow these great organs to become clogged or torpid, and poisonous humors are therefore forced into the blood that should be expelled naturally.

KIDNEY-WORT

WILL SURELY CURE

KIDNEY DISEASES,
LIVER COMPLAINTS,
PILES, CONSTIPATION, URINARY DISEASES, FEMALE WEAKNESSES, AND NERVOUS DISORDERS,

by causing free action of these organs and restoring their power to throw off disease.

Why suffer Bilious pains and aches?
Why tormented with Piles, Constipation?
Why frightened over disordered Kidneys?
Why endure nervous or sick headaches?

Use KIDNEY-WORT *and rejoice in health.*

It is put up in Dry Vegetable Form, in tin cans one package of which makes six quarts of medicine. Also in Liquid Form, very Concentrated, for those that cannot readily prepare it. ☞ *It acts with equal efficiency in either form.*

GET IT OF YOUR DRUGGIST. PRICE, $1.00

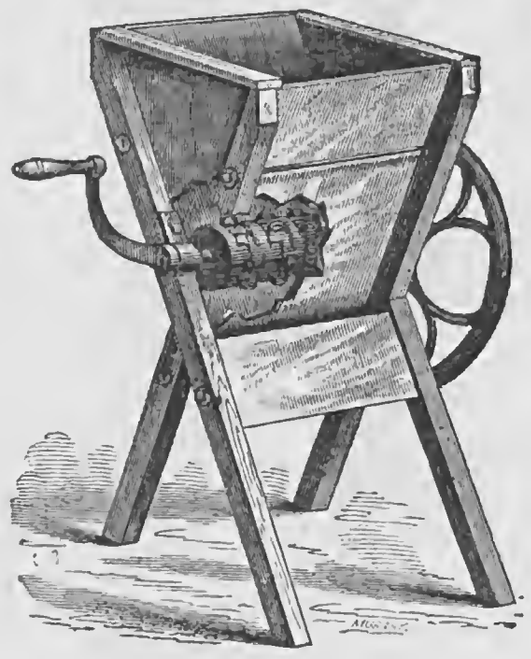
CLARK'S IMPROVED ROOT CUTTER



PERFECTION OBTAINED IN
Cutting Roots.

This Cutter has *received* the First Premium *at every Fair*, and has no *equal*. Do not fail to examine it.

The Neatest, Strongest, Simplest, Cheapest, and most Perfect Root Cutter in the Market.

This Cutter is built with a heavy oak frame, well bolted together; is staunch and strong, neatly finished, handsomely striped and ornamented. The cutting apparatus consists of *twenty-five Steel Knives*, (gouge-shaped), so arranged on a wrought iron shaft that they are perfectly secure; no chance of becoming loose or breaking. The roots are neatly cut in pieces suitable for feeding. *No* coarse ungainly pieces are left by this Cutter. A boy can easily cut 35 to 40 bushels per hour, so easily does it do its work.

☞ Don't fail to examine it.

We are manufacturing three sizes, designated by numbers,—1, 2 and 3.

Nos. 1 and 2 designed for hand use.

No. 3 is the Power Cutter and will cut 100 bushels per hour.

Price, No. 1 ..... $12.00
" No. 2 ..... 14.00

ASTHMA *Quickly and Permanently* **CURED**

Dr. Stinson's Asthma Remedy is unequaled as a positive Alterative and Cure for **Asthma and Dyspepsia,** and all their attendant evils. It does not merely afford temporary relief, but is a permanent cure. Mrs. B. F. Lee, of Belmore, O., says of it: "*I am surprised at the speedy effects of your remedy. It is the first medicine in six years that has loosened my cough and made expectoration easy. I now sleep all night without coughing.*" If your druggist does not keep it, send for treatise and testimonials to

ALUMINUM GOLD WATCHES.

A $15 WATCH FOR $10.

During the past year, we have had many enquiries for a **Stem Winding and Stem setting Watch,** one that could be relied upon, sufficiently attractive for a gentleman to carry and that we could sell at a price low enough to come within the reach of those whose duties compel them to carry a **correct time-keeper,** but whose circumstances will not admit of their purchasing a high priced watch. After going over the whole field of American Manufacture and not finding a watch that would "Fill the Bill" we concluded to look over foreign markets. A member of our firm visited England, France, Germany and Switzerland. In the latter country, he found just what we wanted: **A STEM WINDING WATCH WITH FINE JEWELED NICKEL MOVEMENT,** equal to those put up in Gold Cases and sold in this Country at $100 and $150.) By giving a large order, we got the price reduced so that we could use them in our trade. The next step was to find the right kind of case for the new watch. Armed with a letter of introduction to Professor Lorschfield (the discoverer and only manufacturer of the celebrated metal known as **Aluminum Gold,**) an interview was obtained. Specimens of the metal were exhibited and also numerous articles manufactured therefrom. The Professor also exhibited with much pride, two grand prize medals awarded at the International Expositions, held at Paris, for the marvelous resemblance of the metal to gold, and also for its lasting brilliancy. The interview resulted in our giving an order for cases to be made from his **Aluminum Gold.** We have them made both in round and mansard style and they are Elegantly Engraved or Engine Turned, and are unsurpassed in beauty of workmanship. The Watches are manufactured of the best material, and finished by skilled hand labor, and are only equaled by watches costing ten times as much. They are perfect time-keepers and fully guaranteed, and that they are in every respect as represented, the thousands of testimonials received from our customers amply attest. Price of Sample Watch by Registered mail, **$15.00.** We will send the above watch to any person who orders with the intention of acting as agent, or who will recommend it to his friends, on receipt of **Ten Dollars.**

Gents:—The Aluminum Gold Watch I purchased from your firm three months ago retains its color as brilliant as when first received. I delayed sending my second order because I wished to test the metal. I can now conscientiously recommend them. I enclose $10.00 for one more Aluminum Gold Watch, same as the first. M. M. Watts, Hawthorn, Fla., Nov. 2d, 1881.

Gents:—The second lot of $10.00 Aluminum Gold Watches received all right. I enclose Money Order for five Stem Wind Aluminum Gold Watches, and other watches and goods from your Catalogue. Forward at once and oblige.
George P. Wilson, Grand Forks, Dakota, Oct., 30th 1881.

Gentlemen:—The Aluminum Gold Stem Wind Watch I purchased from your firm is as good a time-keeper as I ever saw. I enclose $15.00, for Stem Winding Coin Silver Watch. Respect'y C. A. Walker, Eastman, Ga., September 18th, 1881.

Gents:— I enclose the money for another watch. Yours, Respectfully,
T. D. Cooley, Dealer in General Merchandise, Williamstown, S. C. March 9th, 1881

Send money by Post Office Money Order, or Registered Letter. We will send the watch C. O. D. if Two Dollars is sent on account, the balance can be paid at the Express Office when the watch is delivered. Let us hear from you with an order.

WORLD MANUFACTURING CO., 122 Nassau Street, New York.

D. LANGELL'S ASTHMA & CATARRH REMEDY.

Having struggled 20 years between life and death with ASTHMA or PHTHISIC, treated by eminent Physicians and receiving no benefit, I was compelled during the last five years of my illness to sit on my chair day and night gasping for breath; my sufferings were beyond description. In despair I experimented on myself by compounding roots and herbs and inhaling the medicine thus obtained. I fortunately discovered this WONDERFUL CURE for ASTHMA or CATARRH, warranted to relieve the most stubborn case of Asthma in FIVE MINUTES, so the patient can lie down to rest and sleep comfortably. Any person not fully satisfied after using one-third of a box can return the remainder to the proprietor and the money will be refunded, or send me your address for a trial package FREE OF CHARGE. Should your druggist not keep the remedy, I can send it by mail on receipt of the price $1.00. For sale by all Druggists. Address D. LANGELL, Proprietor, Wooster, Ohio, or ALBERT IMGARD, Manager, 46 Astor House Offices, New York City.

Humorous.

"WHAT is the distance of the sun from the earth?" was the question that was lately put to a candidate for the civil service. The reply was that he couldn't tell the exact distance, but he didn't think it was near enough to interfere with his duties of post-office clerk.

YOUNG HOPEFUL.—Mamma: "You'll be sorry when uncle Dick leaves us to-morrow, won't you, Tommy?"—Tommy: "O, no, I shan't."—Mamma: "Why not?"—Tommy: "'Cos uncle Dick always gives me a shilling when he goes away!"

TERRIBLY SARCASTIC FATHER.—"Now, I must bid you good-night, Mr. John, for I have an engagement. But say, why don't you stop and take breakfast with us some morning? You always go away an hour or two before it is ready."

"WELL, what do you want here?" remarked Mr. Smith, as he sat up in bed and addressed a professional burglar, who stood in front of the bureau.—"I want money and bonds," hissed the burglar through his clenched teeth, "and quick about it too."—"My friend," retorted Smith, "I've been looking for those things for the last twenty years without success; but go on with your burglary, I'm sleepy."

BY ANY OTHER NAME.

HAT."I say, Old Feller, a Gentleman wants to see your Master." CAP.—"When?" HAT.—"Why, now." CAP.—"Where?" HAT.—"Why, here." CAP.—"Who?" HAT.—"Only me, Old Birchbroom; so look alive!"—[FUN.]

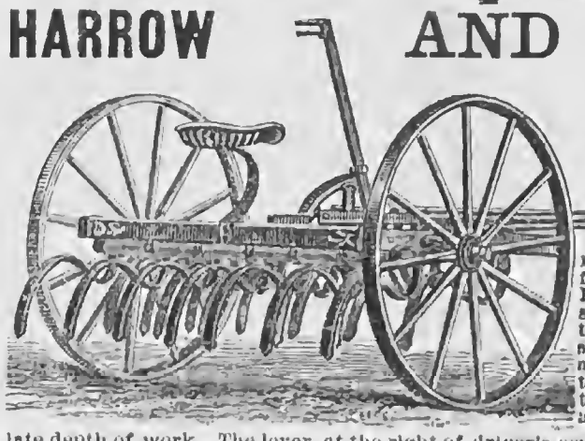
SMITH & WOODARD, Manufacturers, KALAMAZOO, Mich.

The Albion Spring Tooth Sulky HARROW AND CULTIVATOR.



This celebrated Tool has been thoroughly introduced during the season of 1881, in the East and through the West, and hundreds of them have passed into the hands of Farmers, tried and purchased on their merit. This Tool, combined, is a perfect Harrow, a perfect field Cultivator, a perfect sulky Corn or Crop Cultivator; with its force feed Broadcast Seeder Attachment, sowing all kinds of Grain evenly. It is a perfect Seeder. The two sizes, No. 1 and No. 2 have Eighteen and Fifteen Teeth, made of the best spring steel, oil tempered, and are long and thin penetrating the hardest ground easily. The elasticity and spring of the teeth working through the soil imparts a yielding, vibratory motion, which instantly frees them from all obstructions. The frame is mounted two feet from the ground on wheels four feet high, and is adjusted by the axles up and down to regulate depth of work. The lever at the right of driver's seat controls the teeth instantly, regulating the depth and pitch of teeth, or elevating them for driving on road or for any purpose. This tool is strongly made and nicely finished, and will do more and better work than any other Harrow and Cultivator ever offered to Farmers. **Manufactured by ALBION M'F'G CO., Albion, Mich.**
☞ Branch House for Eastern Trade, ROCHESTER, N. Y.

Our New Catalogue of the **Planet Jr. Farm and Garden Implements** is **Free to all,** and we **guarantee** it to **interest** every one who **plants seeds** or **cultivates the soil.** It is a **beautiful** descriptive work of 16 pages, full of illustrations. We want **Market Gardeners** and **Root Growers** to examine closely our fine Garden Tools; Farmers who value Labor-Saving Tools to study out our Combined Horse Hoe, Cultivator and Coverer; and every one who has even a small vegetable garden to learn what the Firefly Garden Plow will save them. NOOKERIES ON THE HOME GROUNDS

SAMUEL PARSONS, JR.

HOW SHALL we treat our gardens or lawn nookeries? to coin a phrase which means, I take it, an aggregation or congeries of nooks and corners combined into a single isolated picture. On general principles nooks of the garden attain a value not only because in them, as Lord Bacon quaintly puts it, "when the wind blows sharp, you may walk as in a gallery," but because these nooks afford the attraction of a surprise, that may be in the truest sense, when properly taken advantage of, a pleasurable surprise. In a word, there must be a succession of nooks, surprises in numbers, all within the limits of one small spot, to make your true nookery, for a bare corner is in no sense a nookery. Memory must surely recall to all of us such spots down in the orchard or behind the barn, and especially in some remote corner of the old-fashioned garden and in the edge of the woods at the back of the house. The old apple tree with the grape-vine trailing over it, down by the drinking-hole for cattle in the corner of the orchard, was a delightful nookery in its way, with its rich turf and charming wild flowers, or weeds as some would call them. Abounding, too, in nookeries of the pleasantest sort was the old flower garden, with its box-lined borders and lark-spur corn-hollyhocks where, for instance, in a far corner, we come suddenly on an old arbor festooned with grape-vine, honeysuckle and trumpet creeper. I think, though, according to my remembrance, the best nookery was to be found down on the edge of the grove, with its pool of water on one side and its bays of shrubby growth and aisles of tree trunks on the other. The rushes and lilies of those remote, still waters, and the wild flowers and climbing vines, Virginia Creepers and Bitter Sweets in the recesses of the woods, even now linger with me as types of what garden nookeries should be.

After recalling the constituent parts of such scenes, it ought not to be hard to adorn, and, if necessary, create, these pleasant nookeries in our gardens. It is not a question of extensive or even exquisite culture, but only a few well directed efforts from year to year and the place takes care of itself. Every one surely can find a secluded nook in the garden or lawn, and there are many things we can do of the easiest nature that will tend greatly to perfect these delightful surprises. Wild flowers can be fostered and even planted in such a way as to preclude all idea whatever of the working of the hand. Hardy shrubs, too, may be used in the most effective manner for this purpose, by planting them singly or in colonies in a thoroughly wild-wood manner. But, I believe, nothing will create such pleasant, artistic surprises in these nooks, and illustrate the proper way to treat them better than the intelligent employment of climbers and creepers. With them alone we can do wonders. Take that old stump before you and wreathe it with festoons of the long, crimson flowers of the Trumpet Creeper—Tecoma radicans. Nothing in its way can be finer except the employment of Tecoma grandiflora, with its great, orange-colored flowers. So vigorous and stout are these climbers that they soon grow into a tossing, wild mass of leaves and trumpet-shaped flowers, to the entire obliteration from view of the old trunk over which they grow. Don't confuse, however, these trumpet flowers with those of the scarlet trumpet vine or honeysuckle—Lonicera [illegible] leaves that often last nearly all Winter. Every one thinks of honeysuckle flowers as sweet-scented and yellow, white or red; but how many stop to examine the rich, glossy shades of honeysuckle leaves, so admirably adapted for carpeting bare spots or draping heaps of stone and stumps and tree trunks? There are scores of varieties of honeysuckles which are, every one of them, worthy of employment.

In some of these sheltered nooks we might even use the unequaled English Ivy, particularly if we use it as a carpet; but we certainly can have the so-called Japan Ivy, Ampelopsis Veitchii, or tricuspidata, in this country the most perfect of hardy creepers for clinging by rootlets to stone or wooden surfaces. Few plant effects can surpass in Summer the glossy color and artistic forms of the leaves and tendrils of the Japan Ivy, or the crimson and gold of its Autumn tints. But we must not forget the other varieties of Ampelopsis in contemplating the charms of the Japan Ivy, for few things are more effective in our tangled wild-wood corners than great masses of the common Virginia Creepers—A. bipinnata. How its piled-up leaves festoon the tree trunks with overlying masses of shining green in Summer and of scarlet and blood-red in Autumn every one familiar with Fall effects must remember. Of an entirely different, but none the less very effective, nature is the Virginia Silk—Periploca Græca—with long, pointed, shining leaves, small flowers and brownish-red stems, reaching out with almost unrivaled speed away up the stem of the tree, illustrating in a temperate zone and harmless manner something of the tree-murdering propensities of certain vines of the tropics. For the adornment of the upper part of the trees and rock masses we must not forget the rich clusters of foliage and charming garlands of flowers of the purple and white wistarias. Wistarias, allowed to reach out, flower and leaf most abundantly in their upper parts, and are, therefore, specially adapted for garlanding a tree or roof far up in the air without reference to covering its lower part. Then there is the neat-leaved akebia; the bold and picturesque, large, light-colored-leaved Dutchman's Pipe; the Autumn-crimsoned purple-berried Bitter Sweet, all lovely climbers for our purpose. But of all charming climbers, I verily believe the clematis must bear the palm. The variety of color and form of its [illegible] is endless, extending, as it does, from the [illegible] Jackmanii to the delicate, small, white and yellow flowers of C. flammula and C. apiifolia. And they are equally fine in the nookery whether carpeting bare spaces of ground or garlanding and draping rocks and trees.

Before leaving a subject thus closely allied to the very heart of nature I would note again, with increased emphasis, that one of the peculiarities of the proper treatment of these pleasant corners, whether in garden or woodland, is that it may be said, almost, that the more you plant and the less you cultivate and cut with the sickle, scythe and pruning knife, the more surely you attain the end desired. Conventional methods are all "beyond compare" any number of cart-loads of scentless bedding plants, mechanically arranged and ribbon-bordered.

RURAL GOLD AND CRIMSON TOMATO—FROM NATURE.—FIG. 548.

NOTES FROM THE RURAL GROUNDS.

The Rural Gold and Crimson Tomato.

WE are not positive as to the year when the "sport" ancestor of the tomato which we have drawn from life made its appearance. It was about five years ago, and certainly not less than four. Neither have we a positive remembrance as to the variety upon which it first appeared as a so-called "sport." We thought it was the Acme and that the "sport" was due to the contiguity of a yellow variety growing near it with which it had crossed the year previous. But Mr. Bliss points out to us that this could scarcely have been, since the Acme was introduced but four years ago.

The "sport" consisted of a faint yellow band about the stem, which gradually merged into crimson. Seed of this was sown the next year and again seed of the tomato most decidedly marked yellow and crimson was saved for the next, and so on every year since. The progress of "fixing" the two colors has been slow. Last season a majority were crimson; about one-quarter were irregularly streaked and the rest quite uniformly marked, as faithfully shown in the portrait. Not alone, however, have we had an object [illegible] of the two colors. Very little attention has ever been paid to improving the *keeping* qualities of the tomato—a consideration, as it has seemed to us, of the very first importance. Cultivators have worked chiefly for *earliness* and, as as a minor consideration, for size and smoothness. As to earliness, all endeavors have been futile, or nearly so. No real progress has been made in this respect for years, and those kinds which are a few days earlier than the earliest of 10 years ago, are watery, small and disposed to rot. For earliness, size and quality we have to-day no better kinds than the Conqueror, Canada Victor or Hathaway's Excelsior. From the very nature of the tomato plant we cannot preserve its best qualities and yet force it to an earlier maturity. Nor, since the art of preserving them in cans has been so perfected, is it desirable, since canned tomatoes are as good as the fresh fruit and far better than those which are forced out of their natural season of ripening. But, as we have said, any systematic attempt to improve their keeping qualities has been quite ignored in so far as we have heard.

Another object which was constantly borne in mind was, therefore, to breed a tomato by selection which should keep sound longer than any other variety. To this end all of those which showed progress towards establishing the two colors in one fruit were pulled as soon as ripe, placed in the sun, and a record kept of how many days they remained in a sound condition. From the longest keeper only has seed been selected during these four or five years for the following year's crop. Last Summer seed was selected from a tomato (distinctly marked gold and crimson, as shown in the engraving) which remained perfectly sound for 17 days. It is reasonable to hope for an improvement upon this, and that ultimately American tomatoes may become enduring enough to bear shipment to England and to be exposed in English markets, plump and sound as long as they are now exposed here. The climate of England is no more favorable to the culture of the tomato than it is to that of Indian corn

RAYS.

I AM not aware that any of your readers grow kale. In Canada, Nova Scotia and in cool, moist and mountainous parts of the United States it should do well. After it gets

the frost it is a good vegetable. It will bear a deal of cold, but hot sunshine and sudden thaws in Winter affect it badly. Besides the Scotch Curled and some improved varieties of the same for culinary purposes, there are kales with leaves most beautifully variegated with red, white and yellow, and crested, and which are used in European gardens in company with dwarf evergreens, daisies, primroses, bulbous plants and the like, to fill up for the Winter season the flower beds that have been vacated by the Summer bedding plants. And these pretty kales are also good to eat. If you want some for next year get your seedsman to order a packet of the Improved Variegated Kale. Sow it when you sow your main rop of turnips.

* *

AND the RURAL farmer watered well his celery and secured the finest crop he ever had in consequence. Celery is as thirsty as strawberry plants, and at no time during the period of its growth should it suffer for want of water, else its growth will be checked, its succulent stalks made stringy and there will be a prevailing tendency to "bolt." In the London market gardens, in that fat belt of land on the bank of the Thames at Fulham and at Woolwich, where the land is deep and black and from exceedingly heavy manurings every year, as fat as fat can be, perhaps the finest celery that enters the London market is grown. The land is naturally moist, the English climate is moister far than the American, still those gardeners almost deluge their celery plants while growing. Some have hydrants in their fields and lead the water through the rows with rubber hose, some have iron pipes and wooden leads, many fields are ditched and the water baled up into cisterns to run off in pipes and leads adown the rows. These gardeners pay from $50 to $100 of rent a year per acre, and still this labor pays them and their crops would not pay without a vast amount of labor. In Eastern Ohio some weeks ago I called upon a gardener whose place is on the bank of the Mahoning River. Last Spring the river overflowed its banks, flooded all his place, washed away his crops and killed the plants he had in his greenhouses. He suffered severely, still he seemed quite buoyant as he pointed out to me some thousands of plants of celery growing in that deep, black land, and told me he expected to get 10 cents a head for them before the Winter should go past. With a good market and such an easy crop as celery in rich, moist land, who would grow geraniums to sell if they wanted to make money?

* *

DR. WARDER, of Ohio, speaking at Boston of the hardy catalpa said: "It has a local habitat of a few hundred miles. It is of rapid growth and very valuable as an ornamental tree. It grows rapidly and the timber is very durable, there being many instances of fence posts of this wood lasting 75 years. * * * In twenty years, in a good soil, it will make three railroad ties per tree."

* *

MR. H. H. HUNNEWELL has contracted with Mr. Douglas, of Waukegan Ill., for the planting of 550 acres of this catalpa in Kansas. The soil is broken up and planted in corn one year before setting out the catalpas. They are planted four feet apart, taking nearly 3,000 to the acre, and Mr. Douglas contracts to take care of them for three cents each until they are old enough to take care of themselves.

* *

A FEW years ago the Double-flowered Sweet Alyssum was reintroduced to public notice. It was received favorably for it is an excellent thing either for the outdoor or window garden. Yesterday a friend showed me a variegated leaved form of it. The variegation is just as good as is that of the common, Single flowered Sweet Alyssum.

* *

THE same friend also called my attention to Tradescantia quadricolor which he was propagating. This is a variety of the variegated form of old-fashioned, green-leaved Wandering Jew; its leaves, besides having the deep white or pale yellow variegation, are also suffused and streaked with glowing red. As a basket or bracket plant or to grow on the surface earth in pots containing roses, callas, or other house plants, or even in bottles of water it is a sterling addition to our list of window plants, and so far it grows as freely as does the common Wandering Jew.

* *

A NEIGHBOR, a florist, built some cheap greenhouses a few years ago. The sides were of wood—spruce, tar-paper and clapboard, with red cedar posts. For the small house one inch spruce boards were set together closely and lined on the outside with tar-paper, outside of which were clapboards. This made a fairly good wall and is in middling condition still. The larger houses were double-boarded, then papered and clapboarded, and are now so rotton that they have to be removed. The damp got in between the double boards and kept them wet all through the Winter months; they rotted quickly in consequence. He is replacing them with single boards.

* *

I CALLED at a seed store the other day and asked if they had got anything new in the way of bulbs. Yes, they had Crocus speciosus, a big, blue Autumn flowering one. I said, "Why, that is as old as the hills!" They knew it, but nobody hereabout had imported it for sale and nobody wanted it till some one exhibited a clump of it last Fall; now there is quite a demand for it. The same was the case with the Spring Meadow Saffron (Bulbocodium vernum) or "Pink Spring Crocus" as they call it at the store. Now both of these are quite hardy and cheap, very pretty and worth growing. If too late this season, see that you have a few next year. LEON.

Franconia, Naomi, and Lost Rubies.

With regard to the identity of these, we have just received the following note from Mr. Charles Downing:—"You ask my opinion as to the identity of Franconia, Naomi and Lost Rubies Raspberries. I have grown the Franconia for 30 years or more, and the Naomi since its first introduction, and had plants of it from the original stock, and also afterward from F. R Elliott and M. B. Bateham and others who claimed them to be distinct, especially in hardiness. I have grown these side by side with Franconia for several years in succession, examined them carefully at different times in the season, not only the fruit, but the growth, foliage, canes, time of ripening, etc., and never could detect any difference; neither could the growers—experts—who came to examine them, and I am satisfied that they are identical. As to the Lost Rubies being the same, I am unable to say, having seen only plants of last season's growth, but the foliage, canes and spines appeared distinct; yet more time is necessary to give a decided opinion."

Pomological

THOUGHTS UPON THE SELECTION OF TREES FOR HOME PLANTING.

T. T. LYON.

THE season for the selection of trees for Autumn planting is now nearly or quite past, especially at the North; and the time is at hand when the plans should begin to take form for the operations of another Spring. To those, therefore, who have not already laid in a stock of trees for Spring planting, I remark that the Autumn is by far the better time to do so, since the Autumn purchaser usually gets "the cream of the stock," and with care may render his trees far safer by heeling them in, in suitable ground, well sheltered against the possible severities of Winter, with the very satisfactory assurance that they will be at hand in Spring at the time to him most convenient for planting.

To those, however, who have yet to procure trees for the Spring, I suggest:

AVOID CHEAP TREES.—Few men are fortunate enough to find opportunities to get something for nothing, or, indeed, to purchase anything for less than its real value. The man who attempts to do so will usually find his match, and will be very likely to discover too late that, like the dog with the bone, in trying to grasp too much he has lost the substance and secured only the shadow.

TALL TREES are generally grown by nurserymen for the reason that almost all buyers are so ill-informed as to demand them, and also for the further reason that they are more profitable, since, if crowded in the nursery, they naturally run up tall and straight, and thus economize space, cultivation, and loss of growth in pruning. Such trees, on the other hand, are in the worst possible condition to bear the shock of removal and free exposure in the orchard. Indeed, they may fairly be said to be much in the condition of the thousands of worthless trees annually removed from the dense shade of the forest to the open exposure of the street or highway, and hopelessly lost.

TREES OF ONE OR TWO YEARS' GROWTH may be planted out with comparative safety, since less of either root or top will be lost in the process, while the tree will have acquired little inherent tenderness, in nursery, from the protection of its neighbors, and, for both reasons, will the more readily recover its lost vigor and its hold upon the soil. Trees of all kinds are by nature more or less fastigiate, pushing their new shoots from near the terminus of last year's branches. Therefore, the planter should determine definitely, at what hight he prefers to branch his trees; and when one or two-year old trees are used head them back remorselessly to that hight, or at the most a very few inches above—just enough to afford room for a set of five or six branches to become a foundation for the future head of the tree.

ONE-AND-A-HALF OR TWO FEET, in locations exposed freely to wind and sun, are ample for the average hight of apples, and especially for pears, plums, cherries and peaches, since at that hight the trunk will soon come to be well shaded from the direct rays of the sun, which are the prolific cause of sun-scald, bark-burst, borers and other ills, to say nothing of the swaying of the tree and the loosening of its roots by the force of the wind.

WELL-BRANCHED TREES of three or more years' growth would doubtless be preferred by many if not by most planters; but to produce such it is indispensable that they each have a clear space, in every direction, of three or four feet, since without abundant side light a suitable set of branches cannot be produced, and hence a well-shaped head becomes impossible.

SIX OR EIGHT TIMES THE USUAL PRICE would be necessary to remunerate the nurseryman for the cost of trees grown in this manner, as compared with those generally grown. That such trees, even at the price suggested, would prove relatively cheap for the purchaser, I very confidently believe, but the prospect that any considerable number of purchasers could be induced to act upon such belief seems so very remote that few if any nurserymen will be likely to venture upon the production of this class of trees beyond what may be needful to meet orders actually given in advance.

ROOT-PRUNED TREES may be grown in this manner to almost any desired age and size, and may be transplanted from the nursery with comparative ease and safety, even after they have reached the age of bearing, if care be taken to repeat the root-pruning every second or third year after the first. Of course, the growing of trees in this manner must add greatly to their cost, and hence they are not likely to be sought except by those anxious to secure the earliest practicable results, with little regard to expense.

A TREE TWO YEARS OLD, from a root graft, or one year old from a bud, managed wisely, will, as the rule, at bearing age be found fully equal to a three or four-year-old tree, as usually managed, while it will ever afterwards be found far more satisfactory.

Arboricultural.

HONEY LOCUST,—Gleditschia Triacanthos.

PROFESSOR J. L. BUDD.

THIS fine native tree has received more attention in Europe than here. It has there sported into different varieties, with extremely varied habits of growth. This tendency to variation is exhibited in growing its seedlings, and we even notice that our native trees are varied in time of flowering, color of petals, habit of growth, and even in hardiness of trees when grown on the prairie. Our correspondence continually indicates a common belief, that this is a true Locust, and that like the Black Locust, it is noted for sprouting and liable to the attack of the borer. We wish to repeat, that it *does not sprout* any more than the maple, and that no form of insect has yet molested it, except a long necked beetle often found on potato vines, called by Harris, *Cantharis cinerea*. Plants in nursery and young hedges are sometimes set back by these hungry fellows at work on the foliage. The only effect observed, aside from a brief check in growth, is that the plants so treated, become more thorny than those unmolested. Several American writers, following Loudon more closely than is creditable, say: The wood of the Honey Locust, when dry, weighs fifty-two pounds to a cubic foot. It is very hard, splits with *great difficulty*, resembling in this and some other respects that of the common locust." London really wrote "*splits with great facility*," which agrees with my practical experience. I have experience with this timber as a fence material, dating back nearly twenty-five years. Fence rails of that age, made from tough native timber, nailed on posts, have outlasted three sets of posts and two sets of Red Oak rails, and the locust rails are yet mostly good. These rails were split and nailed on in June and July. Posts made from native timber, seasoned one Summer before setting, mixed with White Oak posts treated in the same way, lasted equally well. Some *long* Honey Locust posts in this fence, when rotted off, were inverted, and lasted ten years longer in a new fence. It is well to say, that young timber rapidly grown on our rich prairie soil, will in no case, prove as durable as that of our old native trees. But recent observation, in the groves of Illinois of twenty-five years' growth, makes the fact evident, that as growth is impeded by standing *thick*, and complete occupancy of the soil by roots, the proportion of sap wood becomes small, and the heart wood becomes firm and dry, as noted in thick growths of the poplars. As fuel, the Honey Locust rates in value with the Red Oak.

The seed ripens in Autumn, and may be gathered any time during the Fall or Winter. But the sooner pods are gathered after falling to the ground the better. In Cedar County, on Cedar River, and at many points on the Iowa, Des Moines, Missouri, and indeed most of the rivers of the State, pods may be gathered in quantity grown on thornless trees.

Before planting, scald the seeds severely. Part of them will swell. Sift these out with a coarse fanning-mill sieve. Scald the remainder again; repeatedly scalding and sifting, until all are swelled. The ground should be ready and the seeds at once planted. They will come up in two or three days if the weather be favorable, and their upright growth is so rapid that less care is needed in picking out weeds from among the plants, than with any other forest tree seedlings. Keep the weeds down carefully with good culture during the Summer. Take up the plants in the Fall and heel in carefully where water will not stand. If left standing in the seed bed, the plants are often injured during the Winter. After the first year the plants are perfectly hardy, if seeds from our native trees be used. We may here note that the seed sold in the Eastern markets is mostly imported. Many of the plants produced from the foreign Honey Locust seed, prove as tender in our climate as the peach tree. No valuable tree in our list bears transplanting with as little check to growth as the Honey Locust.

Agricultural College, Ames, Iowa.

The Apiarian.

VALUABLE HINTS IN BEE CULTURE

PROFESSOR A. J COOK.

IT has been my good fortune of late to spend two or three days with Mr. D. A. Jones, of Beeton, Ontario, Canada, who is perhaps one of the most successful apiarists in America, and who without doubt possesses a broader experience than any other bee-keeper in the world. He it is who went to Syria and Cyprus to procure and to introduce into America the bees of those far-off countries. He now has a large apiary in Cyprus, and another in Syria, both in charge of Mr. Frank Benton, a graduate of the Michigan Agricultural College, whom Mr. Jones secured to assist him in this great enterprise. Last Winter Mr. Jones, at a very great expense, sent Mr. Benton to Ceylon and the Indies, in hopes to get and introduce into America the famous Apis dorsata. Mr. Benton got the bees, but owing to severe hardships, he was prostrated with a serious illness, and so was not able to care for them, and as a consequence they died in transit. One colony, however, did not die till it had reached Palestine, showing, as Mr. Benton says, a remarakable endurance on the part of the bees. From the knowledge gained by this expensive experience, the procuring of this bee will now be not only possible but comparatively easy. I am most happy to report that Mr. Jones has the persistence to push the matter to a successful issue. This Winter he sends Mr. Benton with an assistant, and so we may be sure to see Apis dorsata at no distant day.

In conversation with Mr. Jones during his two days' visit at my house, I gathered so many rich and valuable hints from his wide experience with several apiaries and hundreds of colonies of bees, hints that were with slight exception exactly in accord with my own observation, that I am glad to give them to the readers of the RURAL.

FEEDING.
